Church and State.—The long-standing struggle between church and state in Italy continued during 1902 with few signs of abatement. It was the fact that he considered the state subordinate to the church that led Count Giusso, minister of public works, to leave the ministry in March on hearing the utterances in the king's speech concerning divorce. It was the same sort of feeling that led the Clerical deputies at the opening of parliament to join with delight in the movement that resulted in the resignation of Signor Zanardelli, whom they hate as the most powerful enemy of Clericalism. Nevertheless, among the Catholics themselves there have not been lacking signs that point to a desire on their part to heal the breach which for years has prevented the realization of a united Italy. This tendency has manifested itself particularly in the "Christian Democracy" movement, and to check its extension and activity Cardinal Rampolla in April, 1902, sent out a circular letter of instruction dealing with it. The Christian Democracy opposes the *non-expedit* policy of Pius IX. which forbids faithful churchmen taking part in parliamentary elections in Italy, but commands them by non-participation silently to protest against the present position of the Pope in Rome. Under the lead of Abbé Romolo Murri, and supported by two or three influential Clerical newspapers, the Christian Democracy has been slowly winning support. Its purpose is merely to establish in Italy a distinctive Catholic or Clerical party, like the German "Centre," or similar groups in other European countries, which shall overlook for the time being the

question of a recognition of the temporal power of the Papacy, and strengthen the church by its support of the crown. The circular issued by Cardinal Rampolla was a strong plea for a stricter observance of the *non expedit* policy, but except in the south it appears to have had little influence.

Foreign Relations.—An incident of note in the foreign relations of Italy during 1902 was the suspension of diplomatic relations with Switzerland in March on account of the refusal of the Swiss government to institute legal proceedings against the editor of an anarchistic paper for an insult to the memory of the late King Humbert. The Swiss government based its refusal on the ground that the demand for the action was a mere personal request of the Italian ambassador and not a formal complaint made on behalf of his government. Through the mediation of the German emperor diplomatic relations were resumed in July. A further event of importance was the Franco-Italian agreement for the protection of Italian interests in the Mediterranean. It is understood that the new arrangement supersedes the old Anglo-Italian agreement, concluded for the same purpose some twenty years ago. The new understanding is described as being not a protocol convention, or treaty, but a formal declaration countersigned in writing and exchanged between the representatives of the two powers. The French minister for foreign affairs, M. Delcassé, in a public utterance stated that Italy had given France a free hand in the west of Tunis. The Triple Alliance was resumed in June, 1902. (See TRIPLE ALLIANCE.) In July, 1902, the king of Italy visited the czar at St. Petersburg. This excited uncommon interest and pleasure among the Italian people and attracted the attention of the continental politicians. For the Red Sea piracies, see ARABIA. In December, 1902, the Italian minister for foreign affairs, Signor Prinetti, delivered a notable address on commercial treaties, in which he was understood to have said that the government would not be opposed to a scheme for practical free trade. He declared that "negotiations for a renewal of the treaties upon a new basis of reciprocity can hardly fail to bring into such strong relief the value of the reduction in our present general tariff that the treaties grant to Austria-Hungary, that the latter will be unable to refuse to leave the Austro-Hungarian market open to Italian wines." From the attitude of the government toward the commercial treaties it is asserted that Italy is ready to increase her free list with any country which is ready to meet her on the reciprocity basis. In this connection it is significant to note that in the latter part of December the Austrian ambassador at Rome officially denounced the commercial treaty between Austria-Hungary and Italy, which will cease to be in force after the end of 1903.

Members of the Mafia Convicted.—Considerable significance was attached to the conviction in July, 1902, at Bologna, of three members of the Mafia, the notorious and powerful secret society. A jury in the Assize Court after a protracted and exciting trial brought in a verdict declaring that Signor Palizzolo, an ex-Sicilian deputy and supposed head of the Mafia order, Signor Trapani, and Signori Fontana, were guilty of murder. The three prisoners were each sentenced to thirty years' imprisonment. A few years ago it would have been practically impossible to find a jury who would dare to convict members of the order and the outcome of the trial was looked upon as an evidence both of the better state of public opinion regarding the lawless organization and a triumph—although a rather slow one—of Italian justice. Palizzolo was arrested nine years before for the murder of Signor Notarbartolo, director-general of the Bank of Sicily in 1893. The trial, during which the government summoned over 2100 witnesses—such was the difficulty in obtaining evidence against the notorious secret society—is said to have cost over 5,000,000 lire.

Industrial and Social Conditions.—More important than any matter of foreign policy is the present situation in regard to the social and industrial life of Italy. The whole people are oppressed with an excessive burden of taxation of a magnitude such as no other nation in Europe is called upon to bear. In addition to the state monopolies and state and municipal lotteries there is a high tariff on the necessities of life, even on such commodities as petroleum and coffee that are not produced in Italy. Then there are direct taxes on lands and houses, stamp taxes on business transactions, and an income tax. The percentage of increase over normal cost on a few articles of daily consumption as a result of some form of taxation is as follows: Salt, 1300 per cent.; sugar, 350; petroleum, 337; wine, 120; coffee, 75; wheat flour, 62; meat, 10. The conditions in the south of Italy are particularly depressing. There political corruption and moral depravity and degeneration go hand in hand. "There are oases of immorality in the north," said a Socialist deputy recently, "but in the south there are only oases of morality." The southern country is priest-ridden and landlord-ridden. It is plagued with mediæval agricultural methods, poor land and poorer crops, meagre educational facilities, and lack of sanitary improvements and means of transportation. Agriculture, industry, and commerce are at a low ebb. And the government, listening to the political corruptionists who control or own the votes, does nothing for the amelioration of conditions that have probably never

been worse than in 1902. Tens of thousands of the inhabitants are emigrating to North and South America annually. Said the mayor of a southern city to Premier Zanardelli, who made a tour of the south in the fall of the year: "I welcome you in the name of my 8000 fellow-citizens of whom 3000 are in America, and the rest are preparing to follow them." Brigandage is reviving, murder and robbery are on the increase, and bread riots have become of such common occurrence as to call for little comment unless they result in an unusual amount of bloodshed and destruction of property.

The Fall of the Campanile.—No political event in Italy during the year 1902, attracted such world-wide attention as the collapse on July 14 of the Campanile, the great bell-tower of the Cathedral of St. Mark's at Venice, one of the most famous monuments of Europe. Begun in A.D. 920, the tower had long been considered one of the greatest architectural glories of Italy. The tower, which stood in the Piazza di San Marco, between the cathedral and the ducal palace, was 323 feet in height from the base to the apex of the spire. The structure was more famous than beautiful, however, the lower part of it, with the exception of a logetta of Sansovino, being of plain unornamented brick. The arcaded belfry and the pyramid surmounted by the bronze figure of an angel (Peace) dated only from the sixteenth century. The statue was recovered from the ruins with its head broken off, but it will be possible to repair it.

The Case of the American Naval Officers.—In April, 1902, there occurred at Venice an incident, not of any importance in itself, but interesting rather because it gave an occasion for an act of international comity on the part of the king of Italy and for the mutual expression of good-will between the governments of Italy and the United States. Five Americans, including a captain of marines, an assistant-surgeon, a lieutenant, a cadet, and a private of the marine corps, all attached to the United States cruiser *Chicago*, landed on April 23 at Venice, where the cruiser touched, to see the sights of the city. In the Café Piazza the Americans got into a brawl with some Italians. The former were arrested and sentenced to four months' imprisonment. The matter was at once reported by the captain of the *Chicago*, and Secretary Hay instructed Ambassador Meyer to look into the matter. After a conference with the Italian minister for foreign affairs, and the satisfaction of the claims of the café proprietor, announcement was made on May 1 that the king had been pleased to pardon the prisoners, and a few days later Secretary Hay, on behalf of President Roosevelt, addressed a note of thanks to the king for his gracious act.

Other Matters.—On January 19, 1902, the Italian senate approved the government bill, already passed by the chamber, for the gradual reduction of local duties on bread and flour together with provisions for making up the consequent loss of revenue. On December 6 the chamber passed an important bill for the municipalization of the public service by which great reforms are expected.

Repeated eruptions of the volcano of Stromboli occurred throughout September, October, and November, 1902, resulting in some loss of property and life.

See ARCHÆOLOGY.

IVORY COAST, a French colony in Africa on the northern shore of the Gulf of Guinea, between the Gold Coast and Liberia, forms one of the administrative divisions of French West Africa (*q.v.*). Including the protected native kingdom of Kong it has an area of about 125,000 square miles and a population estimated at 2,500,000. Although under the general jurisdiction of the governor-general of French West Africa, the colony retains complete administrative autonomy with a governor whose headquarters are at Bingerville. Grand Bassam, the former capital, is the principal port. The colonial budget for 1901 balanced at 1,908,000 francs. The imports in 1900 were valued at 9,080,873 francs and the exports at 8,074,589 francs, the chief articles in the latter category being rubber, 4,725,000 francs; palm oil, 1,475,000 francs; and mahogany, 1,200,000 francs. Coffee culture has been introduced, and the valuable forests of the interior are being cut, although lack of transportation facilities renders shipments difficult.

JACKSON, JOHN BRINCKERHOFF, an American diplomat, was on October 13, 1902, promoted from his post of secretary to the United States embassy at Berlin, to be minister plenipotentiary to Greece, Roumania, and Servia. He was born in Newark, N. J., August 19, 1862, graduated at the United States Naval Academy in 1883, and two years later became an ensign, after a cruise in European waters and some service as an aide to the commander of the European squadron. Resigning from the navy in 1886, he studied law and was admitted to the bar in 1889; and in December of the following year was appointed second secretary of the United States legation at Berlin, a post which he held until November 15, 1894, when he was made secretary of the embassy.

JADASSOHN, SALOMON, a German musician, died February 1, 1902. He was born in Breslau, August 13, 1831, and after studying the piano, violin, and the

THE CAMPANILE

theory of music under many noted musicians, settled in Leipzig in 1852 as a teacher of music. In 1866 he was made conductor of the Psalterion, was kapellmeister of the Euterpe from 1867 to 1869, and in 1871 became professor of the pianoforte, composition, counterpoint, and harmony, at the Leipzig Conservatory. His many musical works display originality in conception and faultless construction, and include a great variety of compositions; and his success in using the canon form gained for him the sobriquet of the "musical Krupp." Besides symphonies, chamber music, and other orchestral compositions, he published many pianoforte pieces, songs, and choral works. Among his more important textbooks are: *Harmonielehre* (1883); *Kontrapunkt* (1884); *Kanon und Fugue* (1884); *Lehrbuch der Instrumentation* (1888); *Elementar-Harmonielehre* (1895); *Der Tonbewusstsein* (1899).

JAMAICA, a West Indian island, constitutes with a number of smaller islands a British colony. The island of Jamaica has an estimated area of 4200 square miles and an estimated population in 1902 of 770,242, almost wholly negro and mulatto. The capital is Kingston (population, 46,542). The colony is administered by a governor (Sir Augustus W. L. Hemming since 1898), assisted by a privy council and by a legislative council of 29 members, of whom 5 are ex-officio, 10 appointed and 14 elected. Revenue and expenditure in the fiscal year 1901 amounted to £760,187 and £763,869, respectively; in 1902, £774,837 and £751,699. In addition there was an expenditure from loans of £1,666,980 and £44,361, respectively. The public debt in 1902 was £3,432,058.

Fruits, especially bananas, pineapples, and oranges, are the staple product. Total imports and exports in 1900 were valued at £1,722,069 and £1,797,077, respectively; in 1901, £1,755,921 and £1,939,142. Percentage values of exports are: Fruit, 51.6; coffee, 7.8; sugar, 7; rum, 6.4; dyewoods, 6.2; pimento, 4. Of the imports 46.8 per cent. come from the United States and 43.3 per cent. from Great Britain; of the exports the United States receives 65.6 per cent. and Great Britain 21.1 per cent. The exportation of bananas in the year ending March, 1902, according to returns of exporting companies, which count two small bunches as one bunch, was over 10,000,000 bunches, the highest record for the colony. It was expected that for the succeeding year the total would be over 12,000,000 bunches.

For some time Jamaica has suffered from economic depression, and the governor's address to the legislative council (February 4, 1902) had little promise of the return of industrial prosperity. It seemed that the limit of taxation had been reached, while widespread poverty prevailed and the business outlook was unsatisfactory. Later in the year, however, a steady development of the fruit trade was noted, and a consequent expansion of the revenue. The outlook in September was stated to be more hopeful than in many years. But a thorough reform is still needed in the primitive and wasteful system of agriculture obtaining with many of the negro inhabitants; their method is extensive rather than intensive, and results not only in getting small crops from large areas, but in the useless destruction of valuable forests.

A serious riot occurred at Montego Bay in April, and the participants were over-awed only by a force of some 600 men. The outbreak was said to be the result, indirectly at least, of the unpopular government policy. The particularly obnoxious features of this policy appeared to be the withdrawal of constitutional privileges by Mr. Chamberlain, the colonial secretary; the readjustment of the incidence of taxation, the prosecution of people for non-payment of taxes, and the failure of the Direct Steamship Line to call on the northern side of the island. The government was compelled to withdraw its bill to readjust the incidence of taxation. Later in the month there were further attempts at lawlessness. The governor appointed Chief Justice Sir Fielding Clarke, an elected member of the legislature, and the officer commanding the troops in the island, as commissioners to investigate the facts. As a result over fifty persons were sentenced in August to terms of imprisonment varying from two to fifteen years.

JAMES, EDMUND JAMES, whose inauguration in October, 1902, as president of the Northwestern University, was celebrated by three days of festivity, delivered on that occasion a notable address on "Some Features of American Higher Education." Among the tendencies in the American system of higher education, he cited the beneficial effect of the non-professional, non-expert, American college board of trustees in preventing isolation by bringing the higher schools in direct touch with the common life of the people and by developing public interest and securing endowments. President James was born May 21, 1855, in Jacksonville, Ill., studied at the Northwestern, at Harvard, and the University of Halle in Germany. After teaching in high schools in 1883 he became professor of public finance and administration at the Wharton School of Finance and Economy in the University of Pennsylvania. In 1884 he became professor of political and social science in the same institution and retained both positions until 1895. At the same time he was also editor of the economic and political publications of the university. In 1895 he became professor

of public administration and director of the extension division of the University of Chicago. He is vice-president of the American Economic Association, and president of the American Academy of Political and Social Science and editor of its *Annals*. He has contributed more than one hundred monographs and addresses to the transactions of societies and similar publications, and is the author of *The Legal Tender Decisions* (1887); *The Canal and the Railway* (1890); *The Education of Business Men in Europe* (1899); *Growth of Great Cities in Area and Population* (1900).

JAPAN, an island empire off the eastern coast of Asia, includes the four large islands of Honshuu, Kiushiu, Shikoku, and Hokkaido (Yezo), together with Formosa (*q.v.*) and many other islands, including the Kuriles and the Pescadores. The capital is Tokio.

Area and Population.—The estimated area of Japan (exclusive of Formosa, 13,458 square miles, and the Pescadores, 85 square miles) is 147,655 square miles. At the beginning of 1899 the population, which increases about 500,000 annually, was 43,763,153, of this number 33,327,935 were inhabitants of Honshuu, the area of which is 87,485 square miles. Kiushiu, with an area of 16,840 square miles, had 6,811,246 inhabitants, and Shikoku, with 7031 square miles, 3,013,817 inhabitants. There is no state religion. The predominating religions are Shintoism and Buddhism. Elementary instruction, which is compulsory, receives government support. Two universities at Tokio and Kioto are also maintained by the state. In the year 1899-1900 there were 26,997 elementary schools with 4,302,623 pupils.

Government.—Before February 11, 1889, Japan was an absolute monarchy. On that date a constitution was promulgated. The executive authority rests with the emperor (*mikado*), who exercises his functions through a cabinet of ministers appointed by and responsible to him. He also exercises legislative power with the consent of the imperial parliament. This legislative body consists of a house of peers and a house of representatives. Members of the former (about 300 in number) comprise princes and the higher nobles, who have life terms, and certain of the lesser nobles elected from their class and appointees of the emperor, who have seven-year terms. Members of the lower house (369 in number) are elected by manhood suffrage, with property qualification. The emperor in 1902 was Mutso Hito, who was born in 1852, succeeded his father in 1867, and overthrew the Shogunate in 1868. The ministry formed on June 3, 1901, by Field-Marshal Viscount Taro Katsura as premier, continued in office during 1902, with the exception of the minister of war. The portfolios were filled as follows: Foreign affairs, Baron Jutaro Komura; agriculture and commerce, Baron Tosuke Hirata; the interior, Baron Tadakatsu Utsumi; finance, Baron Arasuke Sone; war, Gen. Baron Kodama; marine, Admiral Baron Gombei Yamamoto; education, Baron Dairoku Kikuchi; justice, Baron Keigo Kiyoura; communications, Viscount Akimasa Yoshikawa. On March 21, 1902, General Kodama resigned his portfolio to devote himself to his duties as governor of Formosa; he was succeeded as minister of war by Maj.-Gen. Masatake Terauchi.

Army and Navy.—The emperor is commander-in-chief of the army and navy. All able-bodied subjects between the ages of 17 and 40 are liable to three years' military service or four years' naval. The peace strength of the regular army in 1902 was 143,649 officers and men, and the war strength over 600,000. The army has reached a state of remarkable efficiency. For the fiscal year 1902 the military budget amounted to 49,556,334 yen—38,001,477 ordinary and 11,554,857 extraordinary. See *MANGÈVRES, MILITARY AND NAVAL*.

The Japanese navy, like the army, is well managed and efficient, and, even more than the army, is one of the most important potential forces in the politics of the Far East. The personnel in 1901 comprised 30,061 officers and men. The ships available for war use in 1902 are reported as follows: First, second, and third-class battleships, 4, 2, and 3 respectively; 6 armored cruisers; 14 small protected cruisers; 3 torpedo gunboats; 15 destroyers; 25 large and 33 small torpedo boats. For the fiscal year 1902 the naval budget amounted to 37,115,266 yen—20,161,010 ordinary and 16,954,256 extraordinary; for 1903, 28,425,640 yen—21,349,054 ordinary and 7,076,586 extraordinary. In May, 1902, it was announced that a government programme of naval construction for the six years 1904-09 included 4 battleships of 15,000 tons each, 2 armored cruisers of 9900 tons each, 4 second-class cruisers of 5000 tons each, 15 destroyers, and 50 torpedo boats. This plan received some modifications—including the construction of 3 instead of 4 battleships and 3 instead of 2 armored cruisers—and was adopted by the cabinet October 30, 1902. This programme which involved an annual expenditure of 16,500,000 yen for ten years, was strongly opposed by the parliament. See paragraph *Politics and Legislation*.

Finance.—The monetary standard is gold, and the unit of value the yen, worth 49.8 cents. The largest items of revenue are the tax on liquors, the land tax, and customs; the largest expenditures are for the departments of war and marine, for

the service of the debt, and for communications. Provisional statements show a revenue and expenditure of 254,254,532 yen and 254,165,593 yen respectively for the fiscal year 1900; for 1902, 267,100,000 and 266,800,000 respectively. The budget estimates for the latter year were 277,497,003 yen for revenue and 275,887,424 yen for expenditure. The estimated revenue and expenditure for the fiscal year 1903 were 258,000,000 yen and 262,000,000 yen respectively. On March 31, 1900, the public debt stood at 502,967,249 yen, of which 22,126,483 yen were non-interest bearing and the rest at 5 per cent.

Industries.—Although only about one-sixth of the area of Japan is available for cultivation, agriculture is the most important industry. In recent years, however, there has been notable progress in manufacturing, especially in the textile industries. The leading crop is rice, amounting in 1900 to 41,465,137 koku (a koku = 4.9629 bushels). Other crops in that year were: Barley, 8,656,404 koku; rye, 7,496,919 koku; wheat, 4,232,860 koku. Cocoon production in 1900 amounted to 2,752,714 koku, and raw silk 2,493,544 kwan (a kwan = 8.28 pounds). Tea production in 1899 reached about 16,352,000 pounds. The value of the mineral production in 1900 was placed at 49,733,823 yen, including coal amounting to 24,583,038 yen; copper, 16,282,387 yen; gold, 2,832,108 yen; silver, 2,336,558 yen. The manufacture of silk, cotton, and other textiles increased from a value of 17,825,645 yen to 104,977,691 yen in 1896 and 171,583,603 yen in 1899. Almost every branch of manufacturing shows a marked growth, but cotton spinning is the most important. The unfavorable economic conditions existing in 1900 and to a lesser degree in 1901 gave place to more prosperous times, and the outlook of industrial Japan is distinctly promising. The improvement of financial conditions is indicated by the gradual lowering of rates of interest and the substantial increase of the gold reserve in the Bank of Japan. Nevertheless the amelioration of labor conditions, especially in the manufacturing industries, is needed, while the want of more productive territory for the overflowing population—such as Corea, which is still the goal of and perhaps will be the supreme disappointment to Japanese ambition—is as keen as ever. During the last few years the standard of living and along with it prices have been raised considerably, but in general wages have not risen in proportion. In industry, commerce, and government Japan is becoming a western nation, taking to itself the wider outlook and more varied needs of the Occident together with the worry and stress inevitably attendant.

Commerce.—Imports and exports valued in yen are stated as follows:

	1898	1899	1900	1901
Imports ...	277,502,000	220,401,925	287,580,283	255,816,645
Exports ...	165,763,752	214,929,894	204,630,335	252,349,542

The very great excess of imports over exports was a most disquieting factor in Japan's economic development, so that the nearly attained commercial balance of 1901 was a feature of real encouragement to both government and people. The excess of imports in 1896, 1897, and 1898 amounted to about 54,000,000 yen, 56,000,000 yen, and 111,000,000 yen respectively. It is remarkable that the consequent outflowing specie did not seriously derange Japan's currency. The imports in 1901 were exceeded only by those of 1898 and 1900, while the exports in that year were the largest without exception. The foreign trade—imports and exports combined—has increased as follows: 1871 to 1881, 56 per cent.; 1881 to 1891, 129 per cent.; 1891 to 1901, 257 per cent. The leading imports are cotton goods, iron and steel manufactures, wool and woollens, sugar, and petroleum.

The trade of Japan with the countries of greatest commercial importance is stated in yen as follows:

COUNTRIES.	Imports to Japan.		Exports from Japan.	
	1900	1901	1900	1901
Great Britain.....	71,708,424	50,575,787	11,270,770	11,522,723
British India.....	26,539,395	42,779,904	6,062,049	9,657,594
United States.....	62,822,700	42,769,429	63,919,270	72,309,357
Germany.....	29,228,310	28,320,100	3,796,927	5,251,070
China.....	29,690,100	27,258,688	40,257,034	42,925,578
Hong Kong.....	10,670,300	11,141,787	34,291,307	41,783,646
France.....	8,108,751	8,752,827	29,247,837	27,275,671

In 1900 there entered Japanese ports 6630 vessels of 9,825,622 tons and cleared 6656 vessels of 9,835,980 tons; the entrances in 1899 were 3403 vessels of 3,608,494 tons, and the clearances 3549 vessels of 3,777,716 tons. It should be pointed out that beginning with 1900 a vessel is counted at each port made during a voyage, while before

that year it was counted only once. Of the total tonnage entered in 1900, over one-third was British.

Communications.—In 1900 there were 893 miles of railway owned by the state and 2805 miles owned by private companies; 13,879 miles of telegraph line with 59,396 miles of wire; 1794 miles of submarine line with 2033 miles of wire; 1627 miles of telephone line with over 30,000 miles of wire; 4464 post-offices (4832 in 1901). The extension of the telephone in Japan during the last three or four years has been remarkable.

HISTORY.

Foreign Relations.—The most significant event of the year in the diplomatic history of Japan was the conclusion of a treaty of alliance with Great Britain which was signed at London January 30, 1902, and made public February 11 following. The preamble of the treaty recites that the high contracting parties are actuated solely by a desire to maintain the *status quo* and general peace in the extreme East and especially in maintaining the independence and territorial integrity of the Empire of China and of Corea, and in securing equal opportunities in those countries for the commerce and industry of all nations. The high contracting parties therefore mutually recognize the independence of China and Corea and declare themselves to be entirely uninfluenced by any aggressive tendencies in either country. They announce that it will be admissible for either of them to take such measures as may be indispensable in order to safeguard their interests in China and Corea if threatened either by internal disturbance or outward aggression. They further stipulate that if either party in the defense of its interests as above described, should become involved in war with another power, the other high contracting party will maintain a strict neutrality and use its efforts to prevent other powers from joining in hostilities against its ally. But if any other power should join in hostilities against either ally, the other party will come to its assistance, will conduct the war in common and make peace in mutual agreement. They agree that neither party will, without consulting the other, enter into separate arrangements with another power to the prejudice of the interests above described. The agreement is to remain in force for five years. The conclusion of this treaty is universally regarded as an event of far-reaching consequences in its effect upon the future of international politics in the Orient. In Great Britain the announcement occasioned much surprise and some disappointment that the government should have broken away from what was understood to be its traditional policy in the East. The British negotiator, Lord Lansdowne, described it as the "outcome of events in the East and of the part taken by Japan and Great Britain in dealing with them." The affinity of Great Britain for Japan has been noticeable ever since the Chinese-Japanese war when she refused to join Russia, France, and Germany in preventing Japan from reaping the full fruits of her victory. In many quarters, including certain parts of Japan, the opinion has been asserted that the spirit of the treaty is aggressive and calculated to provoke war with Russia. Besides, it is claimed, the alliance will encourage Japan to greater activity in Corea, while the declaration of Great Britain's neutrality will only serve to encourage Russia in her policy of aggression. In this connection it is worthy of mention that a joint Franco-Russian note with reference to the alliance was formally exchanged shortly after the announcement of the treaty. The defenders of the alliance, however, assert that its purpose is defensive and is not directed against any particular power, but is intended to thwart the selfish schemes of certain European powers in China whose interests are against those of Great Britain and Japan. The alliance with Great Britain does not seem to have strained the relations between Japan and Russia since it has been recently announced that negotiations for a commercial treaty between these two powers are nearly concluded. One of the main features of the proposed treaty relates to the question of special privileges for each country's exports to the other.

An incident of note in Chinese-Japanese relations was the withdrawal in November of the Japanese garrison from Shanghai, the government of Japan reserving the right to send troops there again should any other power do so.

Politics and Legislation.—On August 12 the general elections throughout the empire were held, resulting in a sweeping victory for Marquis Ito and the Seiyu-Kai (friends of the constitution). Scarcely one-third of the old members were re-elected. The election, therefore, was equivalent to a vote of censure against the house of representatives whose record was not creditable. The completed returns gave the Seiyu-Kai 192 votes; the Progressists 104; the Independents 59; Imperialists and others, 20. For the first time since the establishment of the constitutional monarchy one party was able to command a majority of the votes in the chamber. Soon after the meeting of the new parliament a conflict arose between the cabinet and the lower chamber over the ministerial scheme for raising money to defray the expense of the elaborate naval programme to which the country is pledged as a result of the alliance

with Great Britain. The provision of the ministerial programme which called out the greatest opposition of the house of representatives was the proposed continuance of the land tax which had expired and which the government had promised not to renew. To this the house was almost unanimously opposed without respect to party, although there was little or no opposition to the naval programme. Marquis Ito, the leader of the Seiyu-Kai, recommended that the increased funds be obtained by a reduction of the budget for the extension of railways, telegraphs, telephones, and other administrative economies. The cabinet finally agreed to abandon the new scheme of railway extension and to reduce the maximum rates of the local land tax in consideration of continuing the increased rate of the national land tax, but even this was not satisfactory, and the Seiyu-Kai in particular seemed determined to overthrow the ministry, which they accused of financial extravagance. The sittings of the house were twice suspended in order to prevent a vote on the question, and finally, in the latter part of December, the chamber was dissolved by order of the emperor in consequence of its refusal to entertain proposals for a compromise.

An incident of note in the administration of internal affairs was the decision of the Japanese government to collect the house tax from foreign residents in the empire. Considerable friction was occasioned in some of the "foreign parts" like Kobe and Yokohama, where foreigners are numerous. Payment of the tax by American residents was being made under protest, when the government officially announced that it had agreed with the foreign governments concerned to refer the matter to arbitration, but meanwhile to enforce the law by making a first collection. The arbitration tribunal consists of two members of the Hague Court with an umpire, and the question to be decided is whether, under existing treaties, the perpetual leases granted by the Japanese government exempt from taxes only the land, or whether both land and buildings are exempted.

JAVA, the most important of the Dutch East Indies (*q.v.*).

JEWS. The total Jewish population of the world is a matter of conjecture from year to year. *Hasell's Annual* for 1903 gives 11,000,000 as the probable number, while the *American Jewish Year Book* for 1902-03 places it at 10,378,530. The *Jewish Year Book* of London distributes them as follows in detail: About 8,397,000 in Europe, with 586,900 in Germany, 1,994,300 in Austria-Hungary, and 5,140,800 in Russia (though the official census figures for 1897 were 5,700,000); Asia, 318,000; Africa, 354,000; the Americas, 1,077,000; and Australia, 10,600. The American reference book states the total number of the Jews in the United States as 1,136,240, with 500,000 in the State of New York, 95,000 in Pennsylvania, 75,000 in Illinois, 60,000 in Massachusetts, and 50,000 each in Missouri and Ohio. This shows an increase of over 90,000 compared with 1,045,555, the number of 1901, and the calculations were based on the rate of mortality among the Jews.

From the Jewish point of view the year was prosperous in general. In Russia the Blondes case of ritual murder was re-tried on February 10-13, and the defendant acquitted. In two universities the percentage of admission for Jewish students was restored to its rate of a year or two before. More liberality was shown in the treatment of sickness-certificates for military non-appearance, as well as in the interpretation of the notorious May laws with reference to the residence of Jews in country-places and in a slight expansion of the "pale of settlement." There were current, even well-founded, rumors of granting the Jews the right of purchasing land within a stipulated amount. The appointment (on May 14) of Gen. Giuseppe Ottolenghi as war minister of Italy and senator of the kingdom, produced a great impression among the European powers and raised high hopes in many quarters. In France, the compromise cabinet of Waldeck-Rousseau was returned on April 26 with greatly increased majorities. Drumont, Cassagnac, Pioux, and Max Régis were badly defeated; most of the Dreyfus champions, notably the socialist Jaurès, were elected afresh, though Vivran was defeated in Paris. In Germany the case of the Jew-baiting *Staatsbürgerseitung* ended in the utter defeat of its editor and proprietor, Count von Pückler; while the expert testimony of Virchow, Leyden, and Bergman in the Konitz trial was instrumental in depriving the anti-Semites of a chance of making another Polna case out of it. England was the one European power to sustain the note of Secretary of State Hay with reference to the Roumanian Jews. The Royal Commission appointed on March 21 by King Edward VII. to investigate the evils and dangers of unrestricted foreign immigration heard many witnesses, Dr. Herzl among them, and though no severe measures were decided upon, yet the very fact of the agitation (really aimed at the Jewish immigration) and the formation of the "British Brothers' League" for that purpose were ominous signs of a vague anti-Semitic sentiment in England. In Roumania the usual atrocities were probably brought to a climax by the Artisans' Bill of February 4, requiring that foreign artisans prove reciprocal rights, in their country, for Roumanians. This was the severest blow at the Roumanian Jews, whom the law of Roumania treats as "foreigners"; as the 60-70 per cent. of them engaged in trades cannot prove reciprocal

rights in *their* country. But on April 30 the king granted the president and the rabbi-preacher of the Bucharest Choral Temple an audience to plead against the iniquities of the new law.

Revival of Feeling of National Unity.—The year was marked by a strong and general reawakening of the spirit of unity among the Jews. In Germany two new societies were formed: the *Hilfsverein der Deutschen Juden* to assist Jews outside of Germany, and the society of theologians, littérateurs, and savants to "promote Jewish science," but chiefly organized on account of the anti-Semitism in the ranks of church authorities and incumbents of university chairs in Germany. Its object is to fight these tendencies and investigate questions of Jewish history, economics, theology, etc. A similar body came into existence in France under the name of *Committee for Combating Anti-Semitism*. In Austria the two factions of Zionists and Nationalists came to an understanding, and their representatives signed an agreement to work hand in hand to advance the welfare of the nation. The new liberal *Oesterreichische Israelitische Union*, though defeated in the official contest with the followers of the old régime, showed a gain of over one thousand members in one year. In Russia periodicals in Yiddish and Hebrew, all advocating nationalism and national regeneration in one way or another, cropped up like mushrooms after a rain, and two firms engaged in the publication (in Hebrew) of general text-books and books of information as well as books relating to the study of the Hebrew language, literature, and history, did a flourishing business. The members of the more intelligent classes, for whom Russian has been their mother-tongue, lately began to exhibit the keenest interest in Yiddish, a "Yiddish Soirée" at St. Petersburg proved a great success. The approaching celebration of Baron Horace Günzburg's seventieth birthday and fortieth anniversary of literary and educational activity (February 10, 1903) was made the occasion of a vigorous agitation and collecting of funds to establish a Jewish Institute in Russia.

Anti-Semitism.—In Germany, though no longer of the brutally militant character as of old, anti-Semitism is still spreading among the intellectuals. *Gesinnungsanti-semitismus* supplants *Radikantisemitismus*, less demonstrative, but quite as effective, and an agitation is carried on to lessen the number of Jews in the liberal professions and positions. When Singer, Stadhagen, and Wurm began a bitter attack on the bill of the Agrarians, the cry *Juden raus!* rang through the hall of the august Reichstag. In Austria, the priesthood by means of systematic propaganda helped the Christian Socialist party, which received from the anti-Semites every kind of assistance at the elections. Ritual murder cases were reported by the press in sensational articles nearly every week, though just as regularly proven groundless. Some serious anti-Jewish outbreaks occurred in Russia at Czenstochowo; in Galicia, in January, thirteen Jews were killed; small anti-Jewish riots took place at Alt-Jariczow, Galicia, on July 20, and at New York City at the funeral of Rabbi Jacob Joseph, on July 30. In Persia two Jewish peddlers were killed, from motives of robbery, near Feruz-Abad by a notorious highwayman, but no justice could be found even after the efforts of the *Alliance Israélite Universelle*.

Hardships.—Fires of disastrous magnitude occurred in the thickly populated cities of Bobruysk, Russia, and Botoshany, Roumania, leaving many thousands of Jews without shelter and any means of subsistence. Palestine suffered greatly from the cholera, the quarantine throwing the inhabitants of Jerusalem and other large cities into dire wretchedness, as most of them make a living by catering to the wants of pilgrims and tourists, who were shut out during the epidemic. Meat-riots, with women as ringleaders, during the early part of the summer, were the order of the day in New York owing to the exorbitant prices set by the meat trust.

Religious Progress; Zionism.—The corner-stone of a synagogue was laid at Lisbon on May 25, 1902, the first in the native land of the *auto-da-fé*, after four centuries of Jewish exile, and the first synagogue in Hong Kong was dedicated on April 8. The Vienna *Actions-Comité* reported that the audience accorded Dr. Herzl by the Sultan on July 27 did not realize their high expectations as the conditions proposed by the Ottoman ruler for Jewish colonization in Palestine did not seem acceptable for the present. The Pan-Russian Zionist Congress met on September 4-10, at Minsk, Russia, with nearly 500 delegates present. Three points of interest were discussed: (1) Organization; (2) culture and economic conditions; (3) colonization. The debates brought out clearly three factions: Democrats, for Western culture; *Mizrahim* (Easterners), for the faith and simple life of olden times; moderates, between the two.

The Jews in the United States.—The year 1902 was probably the most eventful of many in the history of Judaism. In the first place Congressman H. M. Goldfogle introduced (on April 30) a resolution in the House of Representatives, asking for information on what grounds American citizens of Jewish faith were discriminated against, while no such treatment was reserved for citizens of other creeds. However, the official answer was of little consequence and value as information, claiming

as it did that the Jewish American citizens were receiving exactly the same treatment as did Jews of other countries, which was not an answer to the point. The other step taken by the government in behalf of the Roumanian Jews was more momentous. In a diplomatic note, dated August 11, Secretary of State Hay requested the signatories of the Berlin Treaty to call upon the Roumanian government for an explanation of its treatment of the Jews as foreigners which is a distinct violation of article 44 of the Berlin Treaty. See ROUMANIA.

At the Central Conference of American Rabbis held on May 7-8 at New Orleans, the familiar question of celebrating Sabbath on Sunday aroused a great deal of discussion, and a special committee was appointed to frame an exhaustive report to be presented at the next annual meeting. The creation of a new Jewish Theological Seminary of America by means of a merger with the Jewish Theological Seminary (founded in New York in 1886) was hailed with delight by those competent to judge. Through the munificence of several public-spirited Jews the new institution of learning obtained commodious quarters, assured of a large endowment fund, and placed under the care of the well-known Semitic scholar, Solomon Schechter, formerly professor at Cambridge and London universities. The chief events in the way of periodic gatherings were: (1) The annual convention of the Federation of American Zionists (Boston, May 25-26), reporting the total number of societies as 174, inclusive of the 24 new ones (with 837 members) formed during the year; (2) the second biennial meeting of the National Conference of Jewish Charities (Detroit, Mich., May 26-28); (3) the sixth summer assembly of the Jewish Chautauqua (Atlantic City, N. J., July 6-27); (4) the third triennial convention of the Council of Jewish Women (Baltimore, Md., December 2-10); (5) a convention of orthodox rabbis of the United States (New York, July 30-August 6) at which a Union of Orthodox Rabbis was organized, the chief points discussed being: the improvement of the Hebrew schools (*Kheder*), divorce and remarriage, and ways of making the observance of dietary and religious laws more feasible. The appearance of the second and third volumes of the *Jewish Encyclopedia* met with as much popular approval as fell to the lot of the first volume, and gave particular pleasure to those aggrieved at the temporary discontinuance of its publication during the previous years. Several wealthy members of the Jewish community came to the rescue of a publication of vital importance to the whole Jewish people.

Deaths.—The Jewish obituary list for the year included among others the famous sculptor Mark Matveyevich Antokolski; the painter I. L. Ashknazi; the great Lublin (Russian Poland), Rabbi Schneir Zalman Schneirsohn (April 11, aged 72); Immanuel Lazarus Fuchs, professor of mathematics at Berlin (April 26); Rabbi Jacob Joseph of New York; Lord Perbriht (Baron de Worms), member of the House of Lords since 1880; and Jean de Bloch, the famous authority on finance and war, who was of Jewish blood, though not of Jewish faith.

JOHNS HOPKINS UNIVERSITY, at Baltimore, Md., opened in 1876. During 1902 instruction was given at the university by a staff of 146 professors, associates, instructors, assistants and lecturers. The students numbered 689, of whom 188 pursued courses under the philosophical faculty, 338 under the medical faculty, and 163 in the undergraduate courses. Upon the retirement of Dr. Gilman from the presidency in 1901, Professor Ira Remsen was chosen to succeed him and entered upon his duties in that year. His inauguration took place on February 22, 1902, during the celebration of the quarter-centennial of the university's foundation. The celebration was attended by delegates from all the important colleges and was made the occasion for conferring a number of honorary degrees. At about the same time the university received the gift of a new site consisting of 176 acres of eligibly situated land within the city limits. Removal to this site will be begun as soon as the necessary money for the erection of buildings has been contributed and the buildings have been made ready. A subscription by Baltimore citizens, alumni and friends of the sum of \$1,000,000 was made as an addition to the endowment. Of this sum the income only is to be used for current expenses. The State legislature continued the annual grant to the university amounting to \$25,000 a year for the years 1902 and 1903. As residuary legatee, under the will of the late Professor Adams, the university received the sum of \$41,000, to be known as the Herbert B. Adams Fund, the income of which is to be applied to the furtherance of the interests of the department of history and politics. Numerous minor gifts were received, including funds for the purchase of books and apparatus, for publication, and for lectures, amounting to more than \$5000, besides valuable books, portraits, and other contributions. The university's resources amounted to about \$5,000,000 in endowment, more than \$1,000,000 in grounds and buildings, \$250,000 in apparatus and books, and \$250,000 in income. The number of bound volumes in the library was 105,000. Among other events of 1902 were the establishment of the Rowland Memorial Library on Spectroscopy, founded by an admirer of the late Professor Rowland with a donation of \$7000, and the investigation by the department of

political economy into American trades unions. During the year the systematic study of Philippine dialects has been successfully taken up, including courses in Tagalog and Visayan, of the former of which the first English grammar will soon be published.

JOHNSON, JOHN BUTLER, dean of the College of Engineering in the University of Wisconsin, died in June, 1902. Professor Johnson, who was well known as the author of many standard works on engineering, was born at Marlboro, O., June 11, 1850, and was educated at the University of Michigan, where he graduated in 1878. After serving as a civil engineer on the Lake and Missouri River surveys, he joined the faculty of Washington University, St. Louis, in 1883, where he lectured and carried on experiments until called to the University of Wisconsin in 1899. He was a prominent member of American and English engineering societies, and was the author of *The Theory and Practice of Surveying* (1886), *Modern Frame Structures* (1893), *Engineering Contracts and Specifications* (1895), and *Materials of Construction* (1897).

JOHNSON, LIONEL PIGOT, an English critic and poet, whose premature death, October 6, 1902, in London, is recognized as a loss to English letters, was born in March, 1867, at Broadstairs, England. Educated at Winchester College and New College, Oxford, he wrote, while still an undergraduate, an essay on the *Fools of Shakespeare*, an early promise of the critical gift which distinguished his later work. During the brilliant success of the *Anti-Jacobin* he was its chief contributor, and afterwards wrote mainly for the *Academy* and the *Daily Chronicle*. In 1894 he published *The Art of Thomas Hardy*, a notable contribution to English criticism, which won him universal recognition as a critic of the first rank. The only complete volumes which he published, besides *The Art of Thomas Hardy*, were *Poems* (1895), and *Ireland, and Other Poems* (1897).

JONES, FRANK, a former congressman from New Hampshire, died October 2, 1902, at Portsmouth, in that State. He was born September 15, 1832, at Barrington, N. H. While a young man he was engaged mainly in the hardware business, but after 1861 interested himself in brewing. He was elected mayor of Portsmouth in 1868 and in 1869, and was elected to the Forty-fourth and Forty-fifth congresses. He was president of the Boston and Maine Railroad for three years, and was a director of the Maine Central, of many street railways, and of nearly every bank in New Hampshire. He was the owner of the Rockingham House at Portsmouth, the Wentworth in Newcastle, and the Boston Tavern in Boston.

JOSE, JULIO, Marquis de Apezteguia, a Cuban statesman, died in New York City, April 14, 1902. He was born on the island of Trinidad in 1843, of mixed Spanish and Basque parentage, and after studying at the Ecole Centrale in Paris, he returned to Cuba and assumed the management of the large plantations formerly owned by his father. A business visit to New York in 1879 was soon followed by a marriage with an American lady, and a few years later while living in Spain he was elected a member and then secretary of the Cortes. After returning to Cuba he was again sent to Spain as deputy and senator. He was an influential leader of the conservative party in Cuba, and was in favor of a limited home rule; but, though he warmly opposed Spanish despotism, he distrusted the ability of the Cuban people to govern themselves. After the Spanish-American War he made his permanent home in New York City.

JOSEPH, JACOB, chief rabbi of the orthodox Jewish congregations in the United States, died July 28, 1902, in New York City. He was born in 1840 in Wilna, Russia, where he took up clerical duties in the synagogue at the age of eighteen years. While still a young man he was offered a large tract of land by the Russian government, which endeavored to induce him to lead in the establishment of a Jewish colony in Siberia. He refused the offer, however, and in 1887 came to New York at the call of the orthodox Hebrew congregations of that city. He was the head of the Beth Hamedrash Hagodal congregation, became chief rabbi, and was the head of the kosher meat clergymen in the United States. His oratorical powers were noted, and during his career he delivered many lectures. Among several books published by him, is *Beth Jacob*, a work on Jewish religion, history, and law. His public funeral services in New York City were the occasion of a race riot, in which a number of persons were injured.

JOUETT, JAMES EDWARD, rear-admiral, U. S. N. (retired), died October 1, 1902, at Sandy Spring, Md. He was born February 27, 1828, in Lexington, Ky., entered the navy as a midshipman in 1841, fought in the Mexican War and graduated at Annapolis in 1847. At the beginning of the Civil War he was assigned to the west Gulf blockading squadron with the rank of lieutenant. In November, 1861, with a small party he captured a Confederate vessel in Galveston harbor after a desperate hand-to-hand encounter in which he received several wounds. He received the

thanks of the navy department and was put in command of the *Montgomery*. In the battle of Mobile Bay he handled his vessel with a skillfulness and dash that won the highest commendation from Admiral Farragut. He was promoted in due course to rear-admiral, and when he was retired in 1890, Congress granted him full pay for life, by a special act, in recognition of his brilliant services.

JUSSERAND, JEAN ADRIEN ANTOINE JULES, the French ambassador at Washington, who was appointed to succeed Jules Cambon in that position, has had an excellent diplomatic and a distinguished literary career. He was born at Lyons, February 18, 1855, and in 1878 entered the diplomatic service of France as an attaché to the consulate in London, continuing to reside in that city, with slight interruptions, until 1890. During the last three years of that period he was counselor of the London embassy. Appointed minister to Denmark in 1890, he continued in that office until his present promotion. M. Jusserand's literary attainments have given him an international reputation. During his residence in London he followed vigorously the study of English literature, and has since made it his chief intellectual pursuit. He has also written on French literature and literary epochs, and has won wide fame as a keen, comprehensive critic comparatively free from national bias, and a scholar of remarkably extensive knowledge in his chosen department. One of his books, *English Wayfaring Life in the Middle Ages*, was crowned by the French Academy. He has also written the following works: *A French Ambassador at the Court of Charles II.*; *Piers Plowman*; *Shakespeare in France under the Ancien Régime*; *Sports in Ancient France*; and in 1894 published the first volume of what is planned to be a great *History of English Literature*, a work for which special study and residence have helped to prepare him. In 1883 he received the decoration of the Legion of Honor.

KAMERUN. See CAMEROON.

KANSAS, a central western State of the United States, has an area of 82,236 square miles. The capital is Topeka. Kansas was organized as a Territory May 30, 1854, and admitted as a State January 29, 1861. Population in 1900 was 1,470,495; in June, 1902, as estimated by the government actuary, 1,483,000. The populations of the four largest cities in 1900 were: Kansas City, 51,418; Topeka, 33,608; Wichita, 24,671; and Leavenworth, 20,735.

Finance.—The balance in the treasury of the State of Kansas on July 1, 1901, was \$577,625.99. The total receipts during the fiscal year ending June 30, 1902, were \$3,580,380.85, the disbursements \$3,530,639.99, and the balance on June 30, 1902, \$627,366.85. The main item of revenue in the general fund, applicable to ordinary government expenses, was derived from the State tax of 5½ mills. On a property assessment of \$363,156,045 this yielded during the year \$1,866,384.51. At the end of the year the total bonded indebtedness of the State was \$632,000, all of which was held by the educational fund—\$623,000 by the permanent school fund, and \$9000 by the university fund. The debt of the State, therefore, is owed to itself, but the treasurer recommended that the bonds be redeemed as soon as feasible. As in many other western States where the bulk of the revenue is raised by a general property tax, the governor stated that, with the increase of personal property, the farmer, the small house owner and the possessor of real estate paid nearly all the taxes, the owner of the personal property escaping. In 1900, for example, he stated that the total assessment on personal property had been but \$57,000,000, while one item of personalty alone, namely cash deposits in banks, was \$60,000,000. The State tax commission, appointed by the legislature in 1901 to devise a plan to do away with these inequalities, prepared a report to present to the legislature meeting in 1903.

Agriculture and Industries.—The year 1901 was a very unprofitable one for the farming interests in Kansas. The drought and hot winds in July and August severely injured all crops except wheat, which was an exceptionally good crop. In 1902 just the opposite conditions prevailed. The rainfall was much heavier than usual, and all crops except wheat were far above their average yield. The corn crop was valued at \$75,753,911—considerably more than all other crops together. The yield per acre was 30.4 bushels, as against 7.8 bushels in 1901 and 20 bushels for a ten-year average. The acreage for 1902 given in the *Crop Reporter* was less than the census figures for 1899—the respective figures being 7,451,693 acres and 8,266,018 acres. The production for 1902 was given as 222,805,621 bushels. Kansas had nearly 50 per cent. greater acreage of winter wheat (4,162,965) than any other State; but several other States had a larger production. According to the *Crop Reporter*, the total acreage of wheat in 1899 was 3,803,818; in 1902, 4,395,319. The yield in 1902 was 45,827,495 bushels; the value, \$25,205,122. There was a striking difference between the yields of winter wheat per acre in Kansas and the adjoining State of Missouri. In the former it was 10.4; in the latter, 19.9 bushels. Nevertheless, the acreage reported sown in Kansas in the fall of 1902 was 6,066,408—an increase of more than 45 per cent. over the year 1901. There were 941,168 acres of oats, which

yielded 31,529,128 bushels, valued at \$9,458,738. The area of hay land was 1,888,937 acres; the production, 3,211,193 tons, and the value \$13,840,242. The values of potatoes and of flaxseed raised were, respectively, \$4,817,283 and \$1,229,453. Stock-raising has increased greatly in importance during the last five years. The *Crop Reporter's* statistics for January 1, 1903, showed that only Texas and Iowa had a larger number of cattle. Kansas had 9,747,545 cattle, valued at \$81,771,305; 880,715 horses, valued at \$59,139,464; 1,875,692 swine, valued at \$15,980,896; and 271,360 sheep, valued at \$813,891. During 1902 coal was mined in greater quantity than ever before. The year's output was 5,379,500 tons, valued at \$6,727,065 at the mines. Crawford and Cherokee counties were the principal producers. This same region experienced a remarkable growth in the production of spelter, owing to the bringing in of smelters from Illinois and Indiana for the purpose of utilizing the natural gas recently discovered in southeastern Kansas. The Iola district of Kansas and the plants at Lasalle-Peru, Ill., were the only producers of Western spelter at the end of 1902. The smelters ran to their full capacity throughout the year, and many enlarged their capacity. The development of Iola made it an important metallurgical district in the United States. Plants for the manufacture of sheet zinc, lead, and sulphuric acid were built during 1902.

Legal Decisions.—The State supreme court, on June 7, handed down a decision upholding the validity of the Farrelly anti-trust law. All but one of the associates concurred in Chief Justice Doster's decision. The supreme court, on July 21, under the provisions of the anti-trust law, forbade the American Book Company from doing business in the State. During the ten months ending November 1, there were filed in the district court at Topeka 180 suits for divorce, 114 of which were granted. Most of the suits were brought on the ground of desertion. In the Dempster Mill Manufacturing Company vs. Bundy, it was held that a contract between husband and wife, engaged in farming, to the effect that the husband shall work for the wife and act as her agent in what he does, and in payment for such personal services she agrees to work for the husband, with the further agreement that the product of such joint labor shall be the property of the wife, is contrary to public policy, and void, and such contract will not sustain a claim of ownership in the wife of a crop sown, grown, and harvested by the husband, as against his creditors.

Conventions and Platforms.—The Democratic State convention was held at Wichita on May 23. In the platform the national Democratic platform of 1900 was reaffirmed, trusts were denounced, reform of State tax laws, so as to reach trusts and monopolies, was favored, public ownership of public utilities was recommended, free railroad passes were condemned as a mischievous means of discrimination, the attitude of Democrats in Congress on Philippine matters was praised. In State matters, direct legislation and minority representation in the State legislature were advocated, and the submission of the prohibitory amendment to the voters of the State, was urged.

The Republican State convention was held at Wichita on May 28. The planks in the platform included an indorsement of the President, and supported protection, but favored reciprocity, particularly Cuban. Combinations of capital in restraint of trade were opposed. The carrying out of a liberal pension policy was advocated; the abrogation of the Clayton-Bulwer treaty was approved; the Isthmian Canal was favored, the passage of the Chinese exclusion law was upheld, and the making of adequate laws against anarchism was strongly urged.

The Kansas Populists, in convention at Topeka, on June 24, voted against an independent ticket, and ratified the action of the Democratic State convention. The resolutions adopted included declarations in favor of the initiative and referendum and the popular election of senators.

Lynching.—A mob at Pittsburg, on December 25, attacked the jail where was confined Montgomery Godley, a negro accused of having shot Wilton Hinkle, a policeman, who had encountered a gang of lawless negroes. Godley was dragged from the jail, strung up to a telephone pole, and, when it was found that he was not dead, his throat was cut. On the following day it was discovered that he was innocent, the murder having been committed by his brother.

Elections.—At the regular biennial State election, held on November 4, 1902, a full Republican State ticket was elected. The vote for governor was: Bailey (Rep.), 157,506; Craddock (Dem.), 118,348. The new ballot law caused much trouble because of its complications, resulting in the invalidating of almost 10 per cent. of the votes cast. No charges of fraud, however, were brought by either party. Though the Populist convention indorsed the Democratic platform and ticket, many of the former adherents of the Populist party voted the Republican ticket. The fight for the senatorship became very warm immediately after the result of the

election was announced. The legislature for 1903 will consist of 128 Republicans, 32 Democrats, and 5 Populists.

State Officers.—For 1902: Governor, W. E. Stanley; lieutenant-governor, H. E. Richter; secretary of state, George A. Clark; treasurer, Frank E. Grimes; auditor, George E. Cole; attorney-general, A. A. Godard; superintendent of education, Frank Nelson; commissioner of agriculture, F. D. Coburn; superintendent of insurance, W. V. Church—all Republicans. For 1903: Governor, W. J. Bailey, elected for two years, term ending January, 1905; lieutenant-governor, D. J. Hanna; secretary of state, J. R. Burrow; treasurer, T. T. Kelly; auditor, Seth G. Wells; attorney-general, C. C. Coleman; superintendent of education, I. L. Dayhoff; commissioner of agriculture, F. D. Coburn; superintendent of insurance, C. H. Luling—all Republicans.

Supreme Court.—For 1902 and 1903; Chief justice, Frank Doster in 1902, William A. Johnston in 1903; associate justices, William A. Johnston (1902), Henry F. Mason (1903), William R. Smith, Edwin W. Cunningham, Adrian L. Greene, John C. Pollock, Abram H. Ellis (died in September, 1902, and was succeeded by Rousseau A. Burch)—all Republicans.

For congressional representatives see UNITED STATES (paragraph Congressional Representatives).

KANSAS, UNIVERSITY OF, Lawrence, Kan., founded 1864. In 1902 the faculty numbered 81, and the student enrollment was 1233, including 69 graduate students and 619 in the school of arts. The income was \$195,000, and the library contained about 38,000 volumes. A new museum building was completed in 1902 at a cost of \$75,000, in which will be housed the magnificent collection of mounted mammals, birds and fishes belonging to the university and valued at \$250,000. The fund for maintenance for each of the years 1903 and 1904 will be nearly \$200,000, and a new law building is projected at a cost of \$50,000. In 1903 the first summer session under the auspices of the university will be held. The present chancellor is Frank Strong, Ph.D.

KAPOSI, MORIZ, an Austrian dermatologist, died March 6, 1902, in Vienna. He was born at Kaposvar, Hungary, October 23, 1837, studied medicine at the University of Vienna, and in 1879, four years after receiving his degree, became director of the dermatological clinic of the city. In 1881 he advanced to the position of chief professor. He was the author of valuable works on skin diseases, among which may be mentioned: *Die Hautkrankheiten* (1872), *Pathologie und Therapie der Hautkrankheiten* (1879), *Pathologie und Therapie der Syphilis* (1891), *Handatlas der Hautkrankheiten* (3 vols., 1898-1900).

KEDZIE, ROBERT CLARK, professor of chemistry at Michigan Agricultural College, died November 7, 1902, at Lansing, Mich. He was born January 23, 1823, at Delhi, N. Y.; graduated at Oberlin College in 1847, and from the medical department of the University of Michigan, in its first class, that of 1850. During the Civil War he was a surgeon in the Twelfth Michigan Infantry, from which he resigned to become professor of chemistry at the University of Michigan. He was a member of the State legislature in 1867, and from 1873 until 1881, when he was also president of the State board of health. He was vice-president of the American Medical Association, and of the American Association for the Advancement of Science, a fellow of the American Academy of Medicine, and president of the Association of Agricultural Colleges. After forty years of active service, he was retired in June, 1902, and made professor emeritus.

KENSIT, JOHN, an English anti-ritualist agitator, died in the Royal Infirmary at Liverpool, on October 8, 1902, as the result of a severe wound in the left eye, inflicted by a chisel hurled at him during his return from an anti-ritualist meeting at Birkenhead. Born, it is stated, in London, about 1852, he was the inconspicuous proprietor of a bookshop in Paternoster Row, until in 1896 he appeared as the leader of a campaign against the Roman Catholic Church and the ritualistic element in the Establishment. A band of preachers, organized by him under the name of Wicliffites, went about blacklisting churches, disturbing the worship of proscribed congregations, and defying the civil law. Skirmishes at times amounting to riots ensued between these preachers and guards stationed to prevent their entrance. In one instance a cross was removed from a church. Any favor toward the movement which might possibly have existed among communicants of the Church of England was alienated by the fact that the Wicliffites readily occupied Nonconformist pulpits. The troubles culminating in Kensit's death had been in progress for some weeks at Birkenhead and Liverpool. Earlier in 1902 Kensit was a violent protestant on the occasions of the confirmation and consecration of Charles Gore (*q.v.*), Bishop of Worcester.

KENTUCKY, a south central State of the United States, has an area of 40,332 square miles. Kentucky was organized as a Territory in 1790, and admitted as a

State June 1, 1792. The capital is Frankfort. The population in 1900 was 2,147,174; in June, 1902, as estimated by the government actuary, it was 2,208,000. The populations of the largest cities in 1900 were: Louisville, 204,731; Covington, 42,938; Newport, 28,301; and Lexington, 26,369.

Agriculture and Industries.—For 1902, all farm crops in Kentucky, with the exception of winter wheat, were above the average. Corn and tobacco were by far the most important crops. Statistics of corn showed 3,336,791 acres; yield, 90,093,357 bushels; value, \$37,839,210. Comparison of the census figures for 1899 and the statistics of the Department of Agriculture for 1902 seems to show a decrease in the production of tobacco during that period from 314,288,050 pounds to 257,755,200 pounds—over 18 per cent. less. The same sets of statistics indicate an increase of 40 per cent. in the value of the crop—the respective estimates being \$18,541,982 and \$25,775,520. Kentucky ranks first among the States in the production of tobacco—producing nearly one-third of the crop in the United States. The *Crop Reporter* estimates the acreage for 1902 at 322,194 acres. The hay crop for 1902 was considerably above the average—500,204 acres of hay land produced 720,294 tons, valued at \$8,139,322. Weather conditions were not favorable for the growth of wheat in 1902. Moreover, the crop seems not so well adapted to the soil as others. Comparing the census figures for 1899 with the Agricultural Department's statistics, there appears a large decrease in the acreage, production, and valuation of the wheat crop.

Mining in the State was carried on actively in 1902. The coal mines were troubled very little with strikes, and the State mine inspector placed the output for 1902 at 6,421,266 short tons, as against 5,469,986 tons for 1901. The production of whiskey showed considerable decrease in 1902, due largely to the failure of the corn crop in 1901. The total amount of spirit of all kinds produced in 1901 was 30,552,252 gallons; in 1902 it fell off to 25,832,785 gallons. Of fruit brandy only 131,825 gallons were made in 1902. The total number of distilleries in operation was 339. Internal revenue receipts in Kentucky for 1902 were \$21,996,013.

Political.—The developments of the Goebel case during 1902 included the trial of James Howard in January, when he was again convicted of murder. His sentence was changed from that of death to life imprisonment. New trials were applied for in his case and in that of Caleb Powers, who had been sentenced in 1901 to life imprisonment after a second trial. The petitions in both cases were under consideration at the close of 1902 in the Court of Appeals. Gerry Howard, a brother of James Howard, tried as an accessory before the fact in connection with the Goebel murder, was acquitted in April. Garrett Ripley was tried and acquitted for the second time. Henry Youtsey, another alleged accessory, was sentenced to life imprisonment.

Elections.—The legislature of Kentucky on January 14, 1902, elected James B. McCreary (Dem.) United States senator, to succeed William J. Deboe (Rep.) for the full term beginning March 4, 1903, and ending March 4, 1909. The State legislature for 1903 will consist as before of 26 Democrats and 12 Republicans in the senate, and 74 Democrats and 26 Republicans in the house.

Other Events.—During January there was an oil boom in several counties, including Clay, Todd, Christian, Bath, Muhlenburg, and Floyd, and a number of new wells were opened at Hopkinsville. On January 9 twelve companies were organized to prospect in Christian County. Lumbermen from various parts of the Union met at Lexington in April and formed an association to control the prices and grades of poplar timber. William Ritter, of Columbus, O., was elected president. It was reported, early in October, that the Standard Oil Company had bought 2,000,000 acres of oil lands in the State and would begin the construction of a pipe line to cost \$1,000,000. On December 3 this company purchased the entire holdings of the Licking Valley Oil and Gas Company for \$500,000, and about the same time the holdings of the Gaffey and Galley Company for \$850,000. It was announced in December that the Harry Weissinger Tobacco Company's plant at Louisville, one of the largest in the United States, had been sold to northern capitalists for \$1,000,000, and on December 30 the Continental Tobacco Company formally took over the property. The Cumberland and Powell valleys were flooded late in March; railroad bridges and trestles were washed away and plantations laid waste. The feud between the Hatfield and McCoy families was renewed on March 29 after a five years' truce. Harry Watts and John Rutherford, the latter a detective who had a warrant for the arrest of Ephraim Hatfield and entered his house at Blackberry Creek, Pike County, were resisted by Hatfield and his son Thompson. A fight resulted, in which both Hatfields were killed. Their funeral on the 30th was attended by 200 persons, all the men carrying guns. The southern suburbs of Covington were deluged by a water spout on May 20; the water in the streets was 20 feet deep and six persons were drowned.

State Officers for 1902 and 1903.—Governor, J. W. C. Beckham, elected for four years, term ending December, 1903; acting lieutenant-governor (vacancy), Newton

W. Uteley; secretary of state, C. B. Hill; treasurer, S. W. Hager; auditor, G. G. Coulter; attorney-general, C. J. Pratt; superintendent of education, H. V. McChesney; commissioner of agriculture, I. B. Nall; commissioner of insurance, J. B. Chenault—all Democrats except Pratt.

Court of Appeals: For 1902: Chief justice, B. L. D. Guffy; associate justices, A. R. Burnam, J. P. Hobson, T. H. Paynter, George Du Relle, J. D. White, and Edward C. O'Rear. For 1903: Chief justice, A. R. Burnam; associate justices, J. P. Hobson, T. H. Paynter, E. C. O'Rear, H. S. Barker, W. E. Settle, and T. J. Nunn—all Democrats except Burnam and Paynter.

For Congressional representatives see UNITED STATES (paragraph Congressional Representatives).

KHIVA, a vassal State of Russia. See CENTRAL ASIA, RUSSIAN.

KIMBERLEY, first Earl of, JOHN WODEHOUSE, a British Liberal statesman, died in London, April 9, 1902. He was born January 7, 1826, and was educated at Eton and at Christ Church College, Oxford. His long career of official service began in 1852, when he was appointed under secretary of state for foreign affairs. He held this office until 1856, and afterwards in 1859-61. In 1856-58 he was envoy extraordinary to St. Petersburg, and in 1863 was despatched on a special mission to Copenhagen in regard to the settlement of the Schleswig-Holstein question. His most important subsequent positions were: Lord-lieutenant of Ireland in 1864-66; lord privy seal, 1868-70; colonial secretary, 1870-72, in the first administration of Mr. Gladstone, also the same office in 1880-82 during the second administration of that statesman; secretary for India 1882-86; secretary for foreign affairs, 1894-95. While his public service was in no sense brilliant, Earl Kimberley was looked upon as a safe counsellor and careful administrator. A vast fund of political experience had been acquired by him and in his later years he was of excellent service to his party, particularly as leader of the Liberals in the House of Lords after 1897. In 1846 he succeeded his grandfather as third Baron Wodehouse, and in 1866 he was created first Earl of Kimberley. During the long and harassing conflict with the Boers, Earl Kimberley, although unalterably opposed in theory to the policy of the colonial secretary, Mr. Chamberlain, was entirely guiltless of public utterances of his antagonism, for fear of discrediting the government.

KIMBERLEY, LEWIS ASHFIELD, rear-admiral, U. S. N. (retired), died January 27, 1902, at West Newton, Mass. He was born April 2, 1830, in Troy, N. Y. In 1846 he was appointed to the navy from Illinois, and took his first voyage in the *Jamestown*, which was engaged in suppressing the slave trade along the African coasts. In 1850 he was transferred to the Pacific squadron, two years later was promoted midshipman and in 1855 attained the rank of lieutenant. After serving on many stations he was promoted lieutenant-commander in 1862 and assigned to Farragut's flagship, the *Hartford*. He served with Farragut during the war, was then on the European squadron, and in 1866 became a commander and took charge of the receiving ship at New York City, where he remained until 1870. He commanded later the *Benicia*, the *Canonicus*, the *Monongahela*, and the *Omaha*. In 1874 he was commissioned captain. From 1880 to 1883 he was in charge of the New York navy yard, in 1884 became a commodore and was a member of the examining and retiring board at Washington, and in 1866 was commandant of the Boston navy yard. In 1887 he became rear-admiral, was assigned to the Pacific squadron, and in the negotiations over the Samoan Island difficulty displayed a tactfulness that was highly appreciated. His gallant conduct in the hurricane at Apia Bay, March 15, 1889, is well remembered. The only ship that succeeded in keeping up her fires and in escaping from the harbor was the English vessel *Callope*, and as she steamed by his flagship he ordered the band to play "God Save the Queen" and called the men from the pumps to cheer.

KING'S DAUGHTERS AND SONS, INTERNATIONAL ORDER OF THE, an interdenominational organization, founded in 1886 and incorporated in 1889, the objects of which are "the development of spiritual life and the stimulation of Christian activities." The work of the order, which includes Christian service of whatever character, is conducted through circles of varying size, these forming units in chapters and city unions. There are also county, State, and national branches. The order is now organized in 34 States of the United States and in all the provinces of Canada, its total membership approximating 700,000 and its adherents being found in nearly all parts of the world. President, Mrs. Margaret Bottome; general secretary, Mrs. Mary Lowe Dickinson; headquarters, 156 Fifth Avenue, New York City.

KOWEYT, a port and district near the head of the Persian Gulf. See ARABIA.

KRAFFT-EBING, RICHARD, Baron von, a German neurologist, died at Gratz, in December, 1902. He was born in Mannheim, August 14, 1840, and after study at the

universities of Heidelberg, Zürich, Vienna, and Prague, became an assistant physician at the Illenau Asylum for the Insane, where he began the special study of nervous diseases that led to his subsequent reputation for authority in that field. From 1869 to 1872 he practiced in Baden-Baden as a specialist in neurology, served for a year as professor of psychiatry at the University of Strassburg, and in 1873 went to Gratz, where in 1880 he assumed the duties of professor of psychiatry and nervous diseases in the university of that place. He was appointed to the chair of psychiatry and neurology in 1889 at the University of Vienna, where he remained until his retirement to Gratz early in 1902. He was the author of many books on nervous and mental diseases which have been widely noticed by the medical profession and which have contributed greatly to the present status of medical jurisprudence; and his *Psychopathia Sexualis* (1886, 11th ed., 1901) is now received as a standard work. The most important of his other writings are *Grundzüge der Kriminalpsychologie für Juristen* (1872); *Lehrbuch der gerichtlichen Psychopathologie* (1875); *Lehrbuch der Psychiatrie* (1879, 6th ed., 1897); *Neue Forschungen auf dem Gebiet der Psychopathia sexualis* (1891); *Eine experimentelle Studie auf dem Gebiete des Hypnotismus* (3d ed., 1893); *Die progressive allgemeine Paralyse, in the Spezieller Pathologie und Therapie* (1894); *Psychosis menstrualis* (1902).

KRUPP, FRIEDRICH ALFRED, proprietor of the Krupp ordnance works in Germany, died November 22, 1902, at Essen, where he was born in 1854. He was the only son of Alfred Krupp, whose father founded on a small scale the industrial enterprise which is now the largest in the world in the hands of a single firm. The rapid growth of Prussia as a military power, followed by the unification of Germany and the establishment of the German army, created the prosperity of the Krupps. On his father's death, Friedrich A. Krupp became proprietor of the business and managed its affairs with the most unerring accuracy. He also interested himself personally in the welfare of his employees, for whom stores are maintained in which provisions are sold at cost prices, and houses that may be had at a fair rental, as well as libraries and halls for recreation and instruction. He was a member of the Prussian upper house and council of state and of the Reichstag from 1893 to 1898. Just before his death his private character was violently assailed by the socialist paper, the *Vorwärts*. These attacks are thought to have hastened his end. The emperor, who was a warm friend of Krupp's, defended him in a public speech at the funeral, and arraigned the *Vorwärts'* attack as being basely directed against one of the foremost philanthropists of the time.

KÜRSCHNER, JOSEPH, a German author and editor, died July 29, 1902. He was born in Gotha, September 20, 1853, and after four years' training as a mechanical engineer studied for a while at the University of Leipzig. His early literary work, which comprised necrologies of actors, two series of a *Chronologie des Theatres* and the editing of several magazines in Berlin, was followed by the supervision of the monthly journal *Vom Fels zum Meer* (1881-89), of *Neue Zeit*, the official organ of the German Dramatic Authors' Club (1880-82), the *Deutsche Schriftstellerzeitung* (1885-86), and the well-known *Kollektion Spemann und Deutsche Nationalliteratur*, the latter a compilation of 220 volumes. From 1889 to 1892 he directed the various periodicals of a Stuttgart publishing house, and in 1891 established the magazine *Aus fremden Zungen*. He was further connected editorially with the seventh edition of Pierer's *Konversationslexikon* and the *Allgemeine deutschen Literaturkalender*; compiled numerous year books and almanacs, and was the author of *Konrad Ekhof* (1872); *Heil Kaiser Dir!* (1897); *Frau Musika* (2d ed., 1898); *König Albert und Sachsenland* (1898); *China* (1901); *Kaiser Wilhelm II. als Soldat und Seemann* (1902).

KUSSMAUL, ADOLF, a German physician, died in Heidelberg, May 28, 1902. He was born in Graben, near Karlsruhe, February 22, 1822, studied at the University of Heidelberg, and after some service as an army physician continued his studies at Wurtzburg and was nominated professor extraordinary at Heidelberg in 1857. In 1859 he became professor of internal diseases and director of clinics at Erlangen, in 1863 was called to Freiberg to act as clinical director, and in 1876 he received the same post at Strassburg. Besides greatly increasing the general knowledge of epilepsy through his book *Ueber den Ursprung und das Wesen der fallsuchtartigen Zuckungen bei der Verblutung sowie der Fallsucht überhaupt* (with Jenner, 1857), he introduced various mechanical appliances for the treatment of internal diseases, such as the stomach pump and the operation of thoracocentesis; and his name is attached to many other medical discoveries. His writings include many papers to medical journals, and *Die Farbenerscheinungen im Grunde des menschlichen Auges* (1845); *Von dem Mangel, der Verkümmern und Verdoppelung der Gebärmutter* (1859); *Untersuchungen über den konstitutionellen Merkurialismus, und sein Verhältnis zur konstitutionellen Syphilis* (1861); *Ueber die Behandlung der Magenerweiterung durch eine neue Methode* (1869); *Zwanzig Briefe über Menschen-*

pocken—und Kuhpockenempfang (1870); *Ueber die fortschreitende Biellbärparalyse* (1873). His *Jugenderinnerungen eines alten Arztes* appeared in 1898.

LABOR. See CHILD LABOR; FEDERATION OF LABOR, AMERICAN; LABOR LEGISLATION; STRIKES; TRADE UNIONS.

LABOR, AMERICAN FEDERATION OF. See FEDERATION OF LABOR, AMERICAN.

LABOR LEGISLATION. *Recommendations of the President.*—In his annual message to the Fifty-seventh Congress President Roosevelt recommended the enactment of legislation in connection with the interstate commerce law which would render effective the efforts of different States to do away with the competition of convict contract labor in the open market; that so far as practicable provision should be made to render the enforcement of the eight-hour law easy and certain; that women and children in the employ of the United States government should be protected from excessive hours of labor and from unsanitary conditions; that a factory law should be enacted for the District of Columbia; that American labor be protected as far as possible from the competition of laborers brought over by contract; and that all persons should be excluded from immigration to this country who are below a certain standard of economic fitness and who are unable to furnish proof of capacity to earn a living and money enough to insure a decent start under American conditions.

Federal Legislation.—Congress took up the recommendations of the President and in April passed a law re-enacting and extending to the insular possessions the Chinese exclusion act. The act prohibits the immigration of Chinese laborers not citizens of the United States from the insular territories to the United States or from one part of the insular territories to another unless the two places belong to the same group. It is made the duty of every Chinese laborer rightfully in and entitled to remain in any part of the insular territory of the United States, Hawaii (*q.v.*) excepted, at the time of the passage of the act to obtain within one year thereafter a certificate of residence in the insular territory in which he resides upon penalty of deportation. The act does not prevent foreign exhibitors who may have concessions from expositions authorized by Congress from bringing into the United States under contract such mechanics, artisans, agents, or other employees as they may deem necessary for the purpose of preparing or conducting their exhibits.

By an act of July 1 Congress declared that the owners or managers of every coal mine in the territories shall provide an adequate amount of ventilation of not less than 83 1-3 cubic feet of pure air per second or 5000 cubic feet per minute for every 50 men at work in such mine, the air to be forced through by appliances or machinery so as to dilute and render harmless noxious gases. They are further required to keep all entries to coal mines well dampened to allay coal dust, and if water is not obtainable at reasonable cost accumulations of dust shall be removed from the mine. It also prescribes rules and limitation for the firing of shots in the mines of the Indian Territory.

By an act of the same date slavery or involuntary servitude except as a punishment for crime is prohibited in the Philippine Islands. It is also made unlawful for any corporation receiving a grant or franchise from the government of the islands to employ any person alleged to be held in involuntary servitude. Violation of this act is punishable by forfeiture of the concession and a fine not less than \$10,000 in amount.

An act of June 17 authorizing the secretary of the Interior to construct irrigation works in certain contingencies provided that in all such work eight hours shall constitute a day's work and that no Mongolian labor shall be employed thereon.

A measure of much importance to the labor interests was the bill to limit the working day of laborers and mechanics indirectly employed on government contracts which passed the lower house of Congress on May 19, as it had passed twice before. It provided that, except in the matter of transportation or in time of war, every contract made by, or on behalf of, the United States, the District of Columbia, or any territory, should stipulate that laborers or mechanics, whether in the employ of a contractor or of a sub-contractor should be neither required nor permitted to work more than eight hours a day. The government, that is, would assume jurisdiction not only over its own employees but over the employees of all private concerns with whom it did business. As these concerns would not find it feasible to operate one branch of their establishments on a ten-hour basis and another on an eight-hour basis, and as the allotting of all government contracts would be conditional upon the eight-hour day, the bill would greatly aid labor organizations in their efforts "to secure a universal eight-hour day for all wage earners in America." That such was indeed the bill's main intent and purpose was frankly admitted by its advocates. On the other hand, the manufacturers who opposed the bill stated that (1) it connoted a ten-hour wage for eight hours of work; (2) that it

would cause a large increase in the cost of government contracts; (3) that as it prohibited overtime work even for the most liberal payments, it would injure both employer and employee; and (4) that it would be unconstitutional since it assumed jurisdiction over the right of private contract.

The Senate committee on labor and education, to which the bill was referred, failed to report it at the first session of the Fifty-seventh Congress on the ground of insufficient time to take the testimony of those who wished to be heard or to investigate the merits of the bill. At the second session the bill was reported, but with numerous and radical amendments. The amended bill removed the objections urged by government laborers by striking out the limitation which prevented them from working more than eight hours in any one day and by inserting a clause providing that not more than eight hours' work should be done in any one day upon a government contract, leaving the laborer or mechanic free to utilize his time in other work. The bill as amended and reported to the Senate was never acted upon.

"Conspiracy" or Anti-Injunction Bill.—A bill intended to prevent the issuance of injunctions against strikers in case of trade disputes passed the House on May 2, 1902, and was referred to the Senate judiciary committee. This bill had been prepared by the attorneys of the American Federation of Labor and introduced in the Fifty-sixth Congress, where it passed the House with amendments which destroyed its value to the labor organizations. In the Fifty-seventh Congress the bill passed the House as originally drawn, but was so amended by the Senate that the labor unions opposed its further consideration. The original bill provided that in trade disputes in any of the territories, in the District of Columbia, or wherever interstate commerce was involved, "no agreement, combination or contract by or between two or more persons to do or to procure to be done, or not to do or procure not to be done, any act in contemplation or furtherance of any trade dispute between employers and employees . . . should be deemed criminal, nor should those engaged therein be indictable or otherwise punishable for the crime of conspiracy, if such act committed by one person would not be punishable as a crime, nor should such an agreement, combination, or contract be considered as in restraint of trade or commerce, nor should any restraining order be issued with relation thereto." In this form the bill evidently sanctioned and legalized the extreme forms of boycott, and declared in effect that unlike the trusts, the labor trust, when engaged in destructive activity should be immune from prosecution. But this meaning of the bill was rudely shaken when the Senate limited the immune agreements, combinations, and contracts to those "not involving injury to property or breach of the peace." For, in the first place, practically all of the boycotting and picketing combinations would fall outside of this limitation, and besides, as the courts were forbidden to issue injunctions in the specified cases, so inferentially they were granted power to issue injunctions in all the others. In other words, as stated by Mr. Gompers, president of the American Federation of Labor, the amendment transformed an anti-injunction bill to a pro-injunction bill, and defeated its whole purpose. The purpose, Mr. Gompers said, had been "to leave questions of wrongdoing to be dealt with by the criminal law when a man could be confronted by a jury of his peers, and not to permit this tremendous power to rest in the hands of chancery judges." But it seemed clear that the unamended bill was of much wider scope and went to the verge of constitutional authority, if indeed it did not exceed it, in creating an exempt class by special legislation.

Prison Labor Bill.—A prison labor bill which had been drafted by the Industrial Commission and passed by the House in the Fifty-sixth Congress was again introduced in the Fifty-seventh Congress. In substance this bill gave authority to those States which already had legislation to protect their free labor from the competition of prison labor, to enact laws prohibiting the importation into the State of convict-made goods. Under existing conditions, and until such power was conferred, States could only regulate their own prison labor and could not therefore protect the labor market. As stated by Mr. Gompers the labor unions had no desire that convicts should be maintained in idleness; but inasmuch as convict labor received only a nominal return prison contractors could undersell other manufacturers by 35 to 40 per cent. and so reduce the price of standard articles to the great disadvantage of honest workmen. On the other hand, and judging from the experience of the States having convict labor legislation, there seemed small reason to doubt that if the bill should pass, its effect would be to maintain convicts in idleness.

On June 27 the House committee on labor reported a bill providing for the appointment by the President of the United States of boards of arbitration when requested to do so by parties to a labor dispute when interstate or foreign commerce is affected. Congress adjourned without taking action on the report.

Among the States labor legislation for the year was small in amount and unimportant in character. The governor of Iowa in his message of January 16 to the legislature recommended legislation for the settlement of disputes between capital

and labor, the extension of the authority of the Bureau of Labor to enable it to protect employees from inadequate heat and dangerous machinery and the prohibition of the employment of child labor in factories. The governor of Maryland recommended the consolidation of the various labor bureaus of the State. The governor of New York suggested the incorporation of labor organizations as a means of enabling them to enforce agreements with employers and recommended the creation of a court of arbitration to consist of one representative selected by the labor interests, one by the employer, and a third selected by these two, with power to settle the questions at issue. For legislation affecting child labor, see article CHILD LABOR.

Judicial Decisions.—Among notable decisions in 1902 affecting the labor question were: A decision of the Supreme Court of Ohio declaring the eight-hour law to be unconstitutional; a decision of the New York Court of Appeals that members of one labor organization may refuse to work with members of a rival organization and may threaten to strike without incurring legal liability to members of the rival organization for causing their discharge; a decision of the Supreme Court of Washington that an act forbidding the employment of females in certain establishments more than ten hours in a day is not a deprivation of liberty without due process of law, but is within the police power; a decision of the Rhode Island Supreme Court sustaining the constitutionality of the ten-hour labor law and holding that eleven hours could not be contracted for; an opinion of the Oregon Supreme Court that a statute prohibiting the opening of barber shops on Sunday is not a deprivation of liberty or property without due process of law; an opinion of the New Jersey Supreme Court that an ordinance forbidding the employment of women in public drinking saloons is not a denial of the equal protection of the laws; a decision of the Missouri Supreme Court that the benefits conferred by a statute which prohibits the payment of wages for labor in any check that is not negotiable at its face value cannot be contracted away or waived by the laborer; a decision of the Supreme Court of Nebraska that an act restricting the employment of women in certain industries to not more than sixty hours per week was constitutional; and an opinion of the Supreme Court of Washington sustaining a statute similar to that of Nebraska mentioned above.

LABRADOR, a dependency of the British colony of Newfoundland, comprising a large area in the most eastern part of the North American continent. According to the latest report available the population was only 3634. On July 11, 1902, an American scientific expedition under Colonel Glazier left St. John's, Newfoundland, to explore the interior of Labrador. It was reported that the purpose of the expedition was to investigate the prospects of a railway that would open up a new grain route through Labrador and connect with Atlantic steamers. Mr. James J. Hill, manager of the Northern Pacific Railway, was connected with the plan.

LACROSSE. Though as yet played in comparatively few colleges and clubs in the United States lacrosse continued to gain in popularity during 1902 and the season was marked by several interesting and well attended contests. The greatest honors were gained by the Crescent Athletic Club, whose team defeated every American college team it met, besides the representatives of Toronto University, the intercollegiate champions of North America, and the Crescents of Perth, Canada, who are the champions of eastern Canada. Their worst defeat was from the Shamrock lacross team of Montreal, champions of the world, by a score of 15 goals to 5. The championship of the Intercollegiate Lacrosse Association of which Johns Hopkins, Lehigh, and Swarthmore are members, was won by Johns Hopkins. Cornell won the championship of the Inter-University Lacross League by defeating the other members, Harvard, University of Pennsylvania, and Columbia. Harvard was second, with 2 victories, Pennsylvania third, with 1, and Columbia last, with none.

LADRONES. These islands are treated under CAROLINE ISLANDS, and GUAM.

LA FOLLETTE, ROBERT MARION, who was elected governor of the State of Wisconsin for a second term in November, 1902, was born at Primrose, Wis., June 14, 1855. He graduated at the University of Wisconsin in 1879, studied law and was admitted to the bar in 1880, and in the fall of the same year was chosen district-attorney of Dane County, of which Madison, the State capital, is the county seat. He held this office until 1884, and in November, 1886, was elected to Congress, where he served two terms (1887-91). The abilities he displayed in his short congressional career marked him as a man of unusual promise. As a member of the ways and means committee he was of invaluable service to its chairman, William McKinley, in framing the McKinley tariff bill, and was one of the ablest defenders of that measure on the floor of the house. The Democratic landslide of 1890 ended his congressional career and he returned to his law practice at Madison, rising rapidly to the front rank of the Wisconsin bar. When he next entered politics it was as the leading spirit in a revolt against the Republican leadership of ex-Senator

Philetus Sawyer, and his friends, who had for many years controlled the party in the State. The fight was long and bitter, but La Follette finally won. Twice the candidate of the Reform (or "Half-Breed") faction, in 1896 and 1898, he was each time defeated, but in 1900 he secured control of the convention, was nominated and triumphantly elected. His first term was characterized by a prolonged struggle with the "Stalwart," or machine faction, who succeeded in blocking in the legislature the two measures for which the governor stood, a reform in the system of railway taxation and a primary election law, although the State platform pledged the party to secure their enactment. The convention which renominated Governor La Follette in 1902 in the face of strong opposition, reiterated these pledges, which was looked upon as a presage of victory for his principles, a view which the fact that his vote at the November elections fell considerably short of that polled by the rest of the ticket, did not materially change.

LAGOS, a British crown colony on the Gulf of Guinea, lying between Dahomey (French) and Southern Nigeria (British), has an area of 3460 square miles. Beyond the colony is the protectorate of Lagos, with an area of 25,450 square miles. The aggregate population of the colony and the protectorate is variously estimated at from 1,500,000 to 3,000,000; probably the smaller number is the more nearly correct. The capital is the city of Lagos, which with suburbs had in 1901 41,847 inhabitants, of whom 233 were European. The colony is administered by a governor (Sir William MacGregor in 1902, since 1899). Stationed at several large towns in the interior are British resident officials and at Abeokuta a superintendent of native affairs. In 1900 revenue and expenditure amounted to £211,467 and £187,125 respectively, and in 1901 £275,021 and £235,495 respectively. Various tropical products are cultivated. In 1900 imports and exports were valued at £830,470 and £885,112 respectively; in 1901, £737,285 and £909,232 respectively. Imports from Great Britain in the former year were £674,885 and exports to Great Britain £309,265; similar figures for 1901 were £572,350 and £285,711 respectively. The leading import is cotton goods. The chief exports in 1900 were: Palm kernels, £403,614; palm oil, £190,165; rubber, £48,239. On March 4, 1901, a railway was opened to traffic from Lagos to Ibadan (122 miles), with a branch (3 miles) to Abeokuta. Other railway construction is projected.

LANDESMANN, HIERONIMUS, an Austrian poet and author, better known by his pseudonym, "Hieronymus Lorm," died December 3, 1902, at Brünn, Moravia. He was born August 1, 1821, in Nikolsburg, Moravia. At the age of fifteen he became deaf and soon afterwards lost his sight, and yet in spite of these obstacles produced a large number of works which he dictated with the help of signs. He spent his early years in Vienna, where he received his education, lived later in Berlin, Baden, and Dresden, and took up his residence in Brünn in 1892. Many of his poems are included in German anthologies. While in Berlin he was critic for Kühne's periodical *Europa*. His novels include *Ein Zögling des Jahres 1848* (1855); *Der Ehrliche Name* (1880); *Ein Kind des Meeres* (1882). He also wrote dramas, of which *Das Forsthaus* and *Hieronymus Napoleon* are the best known. His poems place him among the foremost of the German pessimistic school. He published *Gedichte* (1870); *Neue Gedichte* (1877); *Nachsommer, neue Gedichte* (1897).

LANDS, PUBLIC. On July 1, 1902, the acreage of the public domain including Alaska and excluding insular possessions was 1,809,539,840 acres, of which 893,955,476 acres were unappropriated and unreserved, 151,161,638 acres were reserved for various purposes, and 764,422,726 acres were appropriated by preliminary entries, filings, or selections, and by school grants. The business of the general land office for the year 1901 far exceeded the record for many years, but the report for the year 1902 shows a further increase in the business transacted. Cash receipts for the fiscal year 1902 were \$6,261,927.18, as against \$4,972,160.79 in 1901, \$4,379,758.10 in 1900, and \$3,070,137.34 in 1899. The disposals of public lands amounted to 19,488,535.30 acres in 1902, as against 15,562,796.30 acres in 1901, an increase of 3,925,739 acres. The number of homestead entries made during the fiscal year 1902 was 98,829, comprising 14,033,245.78 acres, a greater number of entries and a larger amount of land than in any previous year, and an increase over 1901 of 30,181 entries and 4,555,970.73 acres. Cash sales amounted to 1,757,592.63 acres, Indian lands, 116,150.12 acres; all others, including State selections, railroad selections, swamp lands patented, wagon-road selections, etc., 3,581,546.77 acres. Of patents issued during 1902, 47,191, embracing 6,590,360 acres, were of the class denominated agricultural, a decrease of 1046 patents and of 167,360 acres. There were issued 1553 mineral and mill site patents, embracing 57,649.41 acres, an increase of 165 patents and 6,796.94 acres. The increase was greatest in Alaska, California, Colorado, Idaho, Montana, South Dakota, and Utah—the last State alone showing an increase of 4,618.69 acres. A falling off in mineral land claims appeared in Arizona, Arkansas, Nevada, New Mexico, Oregon, Washington, and Wyoming. Coal lands

patented amounted to 12,799.10 acres, an increase of 738.23 acres, entirely due to the developments in Colorado and North Dakota, since the other States and Territories did not equal the number for 1901. Lands to the amount of 4,851,353.41 acres were patented on account of railroad grants and 156,778.25 acres on account of wagon-road grants, an increase over 1901 of 2,371,779.93 acres. During 1902 lands embraced in the Wichita, Kiowa, Comanche, and Apache Indian reservations in Oklahoma were thrown open to settlement and entry under the acts of March 2, 1895, and June 6, 1900. The areas covered by surveys accepted during 1902 aggregated 9,267,978 acres, of which Idaho contributed 1,336,495 acres; Montana, 1,890,353 acres; and South Dakota, 1,401,141 acres.

For the public lands of the Philippines and Porto Rico, see PHILIPPINES and PORTO RICO.

LAOS, an inland district of Indo-China, lying southwest of Tonquin, formerly a part of Siam, but since 1893 a protected state attached to the French colony of Indo-China. It has an area estimated at 98,000 square miles and a population of about 605,000. The capital, Luang-Prabang, on the Mekong River, has a population of 40,000. The government is in the hands of a French resident and the cost of administration is borne jointly by the other Indo-Chinese states. The soil is fertile, producing rice, cotton, tobacco, and indigo, and there are valuable teak forests and mineral deposits, but the country has been very little developed on account of the difficulty of access and total lack of transportation facilities. In September, 1902, it was reported that an open revolt existed in the whole of Upper Laos, even up to the banks of the Mekong, and that a number of the French posts had been attacked.

LATANE, JAMES ALLEN, an American clergyman, died in Baltimore, Md., February 22, 1902. He was born in Essex County, Va., January 15, 1831, and after receiving an academic and legal education at the University of Virginia he studied at the Virginia Theological Seminary in Alexandria. As a Protestant Episcopal minister he held pastorates in Staunton, Va. (1857-71), and in Wheeling, W. Va. (1871-74), but in 1874 he joined the Reformed Episcopal Church, and five years later became a bishop. At the time of his death he was pastor of a church in Baltimore and was in charge of his denomination's missionary work in the South.

LATEY, JOHN, an English journalist, died on September 26, 1902. He was born in London, October 30, 1842, was educated at Barnstaple, Devon, in 1861 joined the staff of the *Penny Illustrated Paper*, and remained until his death connected with that journal, during later years in the capacity of literary and art editor. To it he contributed, with Harry Furness, the series "Bird's-eye Views," and independently satirical articles over the pseudonym "The Showman." For the affiliated *Illustrated London News* he wrote the department of Parliamentary affairs, and in the Commons gallery was familiarly known by his pen name, "The Silent Member." At one time he was co-editor with Mayne Reid of the *Boys' Illustrated News*, and later became editor of the *Sketch*. In addition to the Christmas annuals of the *Penny Illustrated*, he wrote *The Rose of Hastings*, a comedieta; *a Life of General Gordon*; a translation of Féval's *Fils du Diable* as *The Three Red Knights*, and other works. He was a fellow of the Journalists' Institute, and a founder of the London Press Club.

LATTER DAY SAINTS. See MORMONS.

LAURIER, Rt. Hon. Sir WILFRID, Premier of Canada, came into unusual prominence during 1902 by reason of his appearance at London as the dominion representative at the coronation of Edward VII., and also because of his leading part at the conference of colonial premiers held in that city during the summer. He opposed Mr. Chamberlain's proposal for an organization of imperial and colonial forces for the defense of the empire, his objection being based on the fear that Canada might, under such a scheme, be drawn into the vortex of European militarism. During the conference he favored close communication between different parts of the empire, advocated a preferential tariff for Canada in the British market, and other measures looking towards imperial consolidation. His appearance and conferences with British and colonial statesmen during the summer added to the numerous notable occasions on which he has, during the last six years, figured as a public man of more than colonial importance. He heartily supported the British cause during the South African war, proposed the sending of the military contingents from Canada, thus giving, as a French-Canadian premier, especial significance to the loyalty of the dominion. In 1897 he was also the Canadian representative at Queen Victoria's diamond jubilee, and on that occasion made the offer of the Canadian preferential tariff in favor of British goods, which has now been in force five years. Sir Wilfrid was born at St. Linn, in the province of Quebec, November 20, 1841, was educated at L'Assomption College, and entered the provincial legislature in 1871. In 1874 he was elected to the dominion Parliament, where by his eloquence and power in debate he rapidly attained a leading

position. In 1887, on the retirement of Mr. Blake he was chosen leader of the Liberal party, and after nine years was successful in defeating the government and became premier in July, 1896, being returned again in the general election of 1900. He is a graceful orator and skillful parliamentarian, and in manner and appearance is unusually attractive.

LAWN TENNIS. The season of 1902 witnessed a revival in lawn tennis that gave it such general popularity as it had not enjoyed for half a dozen years. This was due quite as much to a noticeable reaction from other sports among both tournament players and those who engage in the game for mere exercise, as to the visit of an English team in competition for the Davis International Challenge Cup, representing the championship of the world. The contest for this trophy took place on the courts of the Crescent Athletic Club, New York City, August 6-8. The English team consisted of H. L. Doherty, the present English singles champion; R. F. Doherty, former champion, and Joshua Pim; the members of the American team were W. A. Larned, present singles champion; M. D. Whitman, former champion; D. F. Davis, and Holcombe Ward, the last two the national doubles champions. The matches resulted as follows: Singles, Whitman defeated Pim, 6-1, 6-1, 1-6, 6-0; R. F. Doherty defeated Larned, 2-6, 3-6, 6-3, 6-4, 6-4; Whitman defeated R. F. Doherty, 6-1, 7-5, 6-4; Larned defeated Pim, 6-3, 6-2, 6-3. Doubles, H. L. and R. F. Doherty defeated Davis and Ward, 3-6, 10-8, 6-3, 6-4. The American team won 3 of the 5 matches, thus keeping the cup in this country for the third time.

At the All-Comers' tournament held at Newport, August 19-27, the English team was again in evidence, but unfortunately all came on the same side of the draw. Pim was defeated by L. E. Ware, 7-5, 7-5, 6-3, and the Doherty brothers met in the semi-finals. Since they make it a practice not to play in tournaments against each other, H. L. defaulted and R. F. met Whitman in the final round, and defeated him, 6-1, 3-6, 6-4, 6-0. With but one match between Doherty and the American championship, which has never yet been won by a foreigner, Larned, in the most brilliant form he has ever shown, defeated the challenger, 4-6, 6-2, 6-4, 8-6. The title in doubles, however, was not retained. The Dohertys, who had won the Eastern championship at Longwood by defeating R. D. and G. L. Wrenn, 4-6, 7-5, 6-2, 6-2, won from the Western champions, Collins and Waidner, 2-6, 6-3, 4-6, 6-3, 6-3, and in the challenge match defeated Davis and Ward for the second time, 11-9, 12-10, 6-4.

The Women's National championships occurred at Philadelphia, June 23-28. Miss Marion Jones, by defeating Miss Carrie Neeley, 8-6, 6-4, won the right to challenge Miss Bessie Moore for the title. Miss Moore, however, on account of illness, defaulted. The doubles were won by Miss Jones and Miss Juliette Atkinson and the mixed doubles by W. C. Grant and Miss Moore. Other championships resulted as follows: Canadian—Singles, B. C. Wright; doubles, B. C. and I. C. Wright. Middle States—Singles, H. Ward; doubles, D. F. Davis and H. Ward. Western States—Singles, Kreigh Collins; doubles, Kreigh Collins and L. H. Waidner. Eastern States—Singles, W. J. Clothier; doubles, H. L. and R. F. Doherty. Southern States—Singles, R. D. Little; doubles, J. P. Paret and W. C. Grant. Pacific Coast—Singles, G. F. Whitney; doubles, G. F. and H. N. Whitney. Northwestern States—Singles, R. D. Little; doubles, R. D. Little and L. H. Waidner. New England—Singles, C. Hobart; doubles, J. Terry and F. E. Howard. International (Canada, at Niagara-on-the-Lake)—Singles, B. C. Wright; doubles, B. C. Wright and Kreigh Collins. Intercollegiate—Singles, W. J. Clothier (Harvard); doubles, W. J. Clothier and E. H. Leonard (Harvard). Indoor Championship—Singles, J. P. Paret; doubles, W. C. Grant and R. Le Roy. The United States Lawn Tennis Association ranks the ten leading players in the country as follows, on the basis of tournament play: 1, W. A. Larned; 2, M. D. Whitman; 3, B. C. Wright; 4, Holcombe Ward; 5, W. J. Clothier; 6, L. E. Ware; 7, R. D. Little; 8, H. H. Hackett; 9, Clarence Hobart; 10, Kreigh Collins.

LEAD. The output of lead in the United States in 1901 was 270,700 short tons, valued at \$23,280,200, or nearly the same as in 1900. This output was distributed among the leading States as follows: Colorado, 73,265 tons; Idaho, 79,654 tons; Missouri and Virginia, 67,172 tons; Utah, 49,870 tons; Montana, 5791 tons; and Arizona, 4045 tons. In addition there was an output of 112,422 tons of lead from ores and base bullion imported from Canada, Mexico, and other countries. The mines in southeast Missouri and in the Joplin district were very active throughout the year, as were those in the Cœur d'Alene district of Idaho; the Leadville mines, however, reported a decrease. Preliminary reports for 1902 indicate a slight falling off in production from the total of 1901. The imports of lead in 1902 in crude form were 107,616 short tons, and the exports were 3271 tons. The lead-smelting industry of the United States is controlled by a trust, which for the past two years has held prices at an almost stationary level.

LEDOCHOWSKI, MIECZISLAW HALKA, Count and Cardinal, a Polish prelate of the Roman Catholic Church who died in Rome on July 22, 1902, was a picturesque factor in later European annals. Born at Klimontow, October 29, 1822, he was educated for the priesthood in the Jesuit Collegium Nobilium at Rome, was ordained in 1845, and appointed by Pius IX. domestic prelate and prothonotary apostolic, he was sent in 1846 to Portugal as auditor of the Lisbon nunciature. Thence he was later despatched to Colombia as papal delegate to five South American republics, but in 1861 was recalled to Rome to become Bishop of Thebes in *paribus* and papal nuncio at Brussels. He was elected archbishop by the cathedral chapters of Gnesen and Posen, and thereby primate of Poland *ex officio*, in 1865, took the oath of allegiance to Prussia the year following, and forthwith restricted the use of the Polish language in connection with the offices of the church and forbade participation by the clergy in the political disturbances of the Polish Nationalist faction. In 1870, after the occupation of Rome by Victor Emmanuel, he proceeded to Versailles, there to petition William I. for the assistance of Prussia in the restoration of the temporal power of the Pope. Such aid having been refused, his entire attitude toward the Prussian government was reversed. He furthered the Nationalist movement in Poland, and became a leader of the Ultramontane party in the *Kulturkampf*. His defiant opposition to the laws of May 11, 12, and 13, 1873, in particular (the so-called May Laws), brought him in 1874 a sentence to two years' imprisonment and deposition from his archbishopric. The Pope thereupon elevated him to the cardinalate. From 1876 he was at Rome, where in 1885 he was appointed secretary of the briefs, and in 1892 prefect of the Congregation of the Propaganda, a dignity second in responsibility and influence to the Papacy itself.

LEEDS, ALBERT RIPLEY, professor of chemistry at Stevens Institute of Technology, Hoboken, N. J., died in Philadelphia, Pa., March 13, 1902. He was born in Philadelphia, June 27, 1843, and graduated at Harvard University in 1865. After teaching for a time at the Franklin Institute in Philadelphia and at Haverford College, he went to Stevens Institute in 1871 as head of the chemistry department. He was a member of the New Jersey State Board of Health from 1881 and served several terms as president of the American Chemical Society. He won a national reputation as a chemist, being known especially as an expert in analyzing water and food products, and was the author of many papers on technical and general chemistry. He retired from active duties only two weeks before his death.

LEEWARD ISLANDS, the northernmost group of the archipelago of the Lesser Antilles in the West Indies constituting a colony of Great Britain. They consist of the five presidencies of Antigua (with Barbuda and Redonda), St. Christopher and Nevis (with Anguilla), Dominica, Montserrat, and the Virgin Islands, which are united in a central federal organization, each retaining its local legislature. The total area of the islands is 701 square miles, and the population (1901) 127,434. The seat of the federal government is St. John, Antigua, where the governor (Sir Gerald Strickland) resides, and where the general legislative council, partly representative in its makeup, holds its meetings. The revenue in 1901 amounted to £123,450 and the expenditure to £132,887. The public debt in 1901 was £286,321, a decrease of £7000 in the year. The imports increased from £346,395 in 1900 to £358,230 in 1901, and the exports from £279,020 to £307,344 in the same period. The trade is largely with Great Britain and the United States, and the staple product is sugar, exports of which, in 1900, amounted to £230,029.

Antigua, the most populous of the group, has an area of 108 square miles, and with the islands of Barbuda and Redonda (area 62 square miles) constitutes a presidency of the Leeward Island colony. The total population (1901) is 34,971, and the capital, St. John, with a population (1901) of 9262. In 1901 the revenue amounted to £42,067 and the expenditure to £48,514. The public debt is £136,571. Both imports (£116,745) and exports (£107,244) show a slight increase in 1901 over the previous year. The principal products are sugar, of which 9124 tons were exported in 1901, and pineapples.

Dominica, the largest island of the group, has an area of 291 square miles, and a population (1901) of 29,000, two-thirds of whom speak French. Roseau, the principal town, has a population of 6000. The revenue for 1901-02 amounted to £29,598 and the expenditure for the same period to £29,673. The public debt is £65,900, a reduction from £70,000 in 1900. The imports and exports amounted (1901-02) respectively to £79,386 and £66,892. There is little sugar cultivated, but the island is prosperous, the principal products being coffee, cacao, and fruits.

Montserrat has an area of 32 square miles, and a population (1901) of 12,215. Plymouth, its chief town, has a population of 1461. The revenue fell from £18,394 in 1900 to £9151 in 1901, and the expenditure from £17,266 to £11,068. The trade and commerce of the island is in a prosperous condition, the imports having decreased from £20,587 in 1900 to £11,693 in 1901, and the exports, largely sugar, lime-juice, and coffee, showing a remarkable increase, from £8287 to £22,247.

St. Christopher, popularly known as *St. Kitts*, with *Nevis* and *Anguilla*, constitute a presidency of the Leeward Islands, having a total population of 46,466 in 1901. *St. Christopher*, containing many successfully cultivated sugar plantations, has an area of 65 square miles, and a population of 29,782 (1901), of whom 9962 live in the chief town, *Basseterre*. *Nevis* has an area of 50 square miles, and a population (1901) of 12,774, and *Anguilla* an area of 35 square miles, and a population of 3890. The trade and agricultural conditions in the islands have undergone considerable improvement within the year. The revenue in 1901 amounted to £43,792 and the expenditure to £42,971. The public debt is £64,932, a considerable decrease from 1900. The imports increased from £136,435 in 1900 to £149,729 in 1901, and the exports from £109,783 to £127,051. The staple products are sugar, rum, coffee, and cacao from *St. Kitts* and *Nevis*, and salt and cattle from *Anguilla*.

Virgin Islands, the most northerly presidency of the Leeward Islands colony belong to the group of which the Danish West Indian Islands form the principal part. The three British islands of *Tortola*, *Virgin Gorda*, and *Anegada*, have a combined area of 58 square miles, and a population (1901) of 4908. The revenue and expenditure were £1796 and £1924 respectively, and the imports and exports £3048 and £3204, the latter figure showing an increase from £2812 in 1900. Cotton and sugar are cultivated.

LELAND STANFORD, JR., UNIVERSITY, Palo Alto, California. Founded in 1887; opened in 1891. The university opened in September, 1902, with the largest attendance in its history, the enrollment for the first semester being 1330, and for the year 1473. There has been little change in the administrative policy or the instruction the past year, and probably will be little for the next year or two, as the greater part of the income is being spent in the erection of new buildings. The endowment is approximately \$35,000,000. The number of volumes in the library is now about 70,000, exclusive of pamphlets. The original buildings of the university consisted of a quadrangle of twelve buildings, with an arcade running around the interior, three small engineering buildings, and a museum building. In 1898 work was begun on the outer quadrangle, which will surround the inner quadrangle and be connected with it by arcades. This outer quadrangle was half completed by the close of 1901, and the close of 1902 saw completed all the buildings of the outer quadrangle. A large chemistry building, begun in 1900, has been completed and occupied, two fine engineering buildings have been completed, and work begun on an enlargement of the museum, which will quadruple its present size. The foundation for a large and well arranged gymnasium has been put in, and in December, 1902, the corner-stone was laid. With the close of 1902 has come the announcement that plans have been accepted for a magnificent library building, and that work will be begun on the foundations early in 1903. It is Mrs. Stanford's intention to build and equip a library intended for advanced research. It is hoped to have the building ready for occupancy in four years. Perhaps the crowning feature of the whole architectural plan is the memorial church, completed at the close of 1902, the dedication ceremony occurring on January 25, 1903. This is one of the handsomest structures in America, and, though not so large, will vie with European cathedrals in beauty. The cost of the church has been about \$1,000,000. It is richly decorated with carvings and Venetian mosaics, while the stained glass windows are among the handsomest in America. Rev. R. Heber Newton was installed as pastor of the university. There will be no marked expansion of the work of the university, with the exception of the engineering courses, which have received a very material increase in equipment this past year, until the buildings are in large part completed, the reason being that the buildings are all being built out of the excess of income from the endowment. When the buildings are completed and the income is released for the expansion of the educational work of the university, it is probable that the expansion will be along the lines of a graduate institution for advanced research rather than that of a great popular college, something with which the State is already supplied in the State University at Berkeley.

Several faculty changes occurred during the year as a result of the contest over the question of academic freedom of speech. On this subject Mrs. Stanford formally expressed her views in a communication to the trustees. The system of government of the university will be radically changed by the recently announced retirement of the surviving founder from active participation in the control of the institution, and all powers of administration will be vested in the board of trustees.

LEPROSY. The commission appointed to investigate the origin and prevalence of leprosy in the United States reports that 278 cases exist, distributed as follows: California 24, Florida 24, Louisiana 155, Minnesota 20, North Dakota 16, New York 7, Illinois, Mississippi, and Missouri, each 5, Texas 3, Wisconsin 3, Massachusetts 2, and 9 other cases scattered among as many States. Of these 145 are American born, 120 foreign born, and the remainder uncertain. Summarizing, the commission

MEMORIAL CHURCH, Leland Stanford Junior University

says that the number of cases is smaller than is generally believed; that leprosy is conveyed from one person to another in the southern coast States; that the majority of cases are at large; that only 72 cases are isolated and provided for by the communities in which they live; and that many if not all of those at large would be willing to become public charges if proper leprosaria existed. The commission recommends the establishment of a retreat for lepers either in the arid southwest or in a similar region farther north or on an island in the Gulf of Mexico, or on the Pacific coast. A bill for the establishment of a national leper home was introduced in Congress by Senator Platt, of New York. The measure contains stringent regulations for lepers, and provides that the lepers of Hawaii and the Philippines and Cuba shall be admitted to the institution. It sets aside a square mile of public land for a national leper home and provides \$50,000 for buildings. The bill also holds State boards of health responsible for the enforcement of regulations for the isolation of cases of leprosy which are not sent to the national home, and prohibits the entrance into the United States of immigrants from countries where leprosy exists unless accompanied by certificates showing them to be free from the malady. The lepers of Molokai, the Hawaiian leper colony, have petitioned the Senate against the bill. They prefer to remain under the control of the Territorial government. The governor of the island of Guam asks \$2000 from the Navy Department for the purchase of land and the erection of buildings for a leper colony. He has found several cases of the disease and has isolated them. During the interregnum immediately following the withdrawal of the Spanish government the few lepers slipped out and became scattered among the people of the villages. Leprosy is said to have developed to an alarming extent in Nicaragua. About fifteen years ago there were 200 lepers there, while at present the number in and beyond the second stage of the disease is placed at from 1500 to 2000. In New South Wales there were in 1901 11 cases of leprosy. They are treated at the Little Bay Lazaret with injections of perchloride of mercury, with but little effect on the disease. Beneficial effects continue to be claimed for chaulmoogra oil in the treatment of leprosy. This is an unofficial preparation expressed from the seeds of the *Gynocardia odorata*, an East Indian tree. Both the crude oil and its active principle, gynocardic acid, are used. The Honolulu Board of Health is soon to institute experiments with the X-rays as a treatment of leprosy. It is believed that the rays may prove specific for the early stages of the local skin lesions. According to an official report there were 37 lepers in the German empire at the end of the year 1901. In all cases the disease was contracted abroad. The leprosy conference held at Wardha, India, is convinced of the contagious character of the affection, and expresses regret that the conference of 1890-91, while reaching the same conclusion, saw fit to minimize it by stating that "under ordinary human surroundings the amount of contagion is so small that it may be disregarded." The conference urges strict segregation in leper asylums. Dr. Jonathan Hutchinson, who recently returned to England after studying the causes of leprosy in South Africa, has arrived at the conclusion that the primary cause of the disease is the use, as food, of badly cured salt fish which is sent inland from Cape Town and elsewhere on the west and south coasts and is largely consumed by farmers and in the industrial centres. Although this is the chief cause of diffusion, Dr. Hutchinson found conclusive evidence that leprosy, in very exceptional circumstances, may be communicated from person to person. He does not believe it to be infectious or contagious in the ordinary sense, but it may be communicated by eating food contaminated by lepers' hands.

LE ROUX, ROBERT-HENRI, better known as HUGUES, who came to the United States in 1902 to deliver a course of lectures at Harvard University and in various cities, is the author who asserted that *La Belle Nivernaise*, originally given to the public under the name of Alphonse Daudet, was written by himself. He was born at Havre in 1860. As early as 1882 he began to make notable contributions to the leading French journals, and succeeded Jules Clarétie upon his withdrawal from the staff of the *Temps* in 1885. His reputation as a novelist, playwright, explorer, journalist, and lecturer rests on the foundation of twenty-odd volumes, written in a captivating manner that combines earnestness with the generic suavity and grace of the Parisian. *Nos Fils* and *Nos Filles*, which appeared first in *Le Figaro*, in the form of short articles, are representative of his powers. Among other works which may be mentioned are: *L'Attentat Sloughine* (1885); *L'Enfer Parisienne* (1888); *Les Larrons* (1890); *Les Mondaines* (1893); *Le Maître de l'heure* (1897). His American lectures treat of the modern French novel, of Abyssinia, and of French society. His statement as to the authorship of *La Belle Nivernaise*, whether groundless or not, leaves in either case, something to be desired.

LIANG CHEN TUNG, appointed in 1902 to succeed Wu Ting Fang as Chinese minister to the United States, was born in China about forty-one years ago. In 1872 he was sent to the United States to be educated, and completed a course of study

in history, political science, and law at Yale University. Returning to China he entered the government service, and later accompanied Li Hung Chang to London as interpreter. He continued in the official family of the great viceroy, acting as his secretary during the peace negotiations following the Chinese-Japanese war in 1894-95. He was secretary of the special embassy sent to Queen Victoria's Jubilee in 1897, and in 1901 was secretary of the embassy headed by Prince Chun that carried to Germany China's apology for the murder of Baron von Ketteler, the German minister at Peking during the Boxer uprising. In the summer of 1902 he accompanied, in the capacity of secretary, the Chinese embassy sent to London to be present at the coronation of Edward VII. He was created Honorary Knight Commander of St. Michael and St. George by Queen Victoria in 1897.

LIBERIA, a negro republic of Africa, on the western Guinea coast, has an estimated area of about 35,000 square miles and a population variously estimated at from 1,500,000 to 2,000,000. About 60,000 are Americo-Liberians. The capital, Monrovia, has between 5000 and 6000 inhabitants. The government is modeled after that of the United States. Effective government administration extends only a few miles inland. The president in 1902 was Mr. George W. Gibson, who was elected by special legislation in December, 1900, to succeed Mr. William D. Coleman, resigned. Revenue is derived mainly from customs. For the fiscal year 1900 the reported revenue and expenditure were \$218,804 and \$207,935 respectively. The foreign debt, with interest arrears, amounted to \$96,997 (\$472,036) in June, 1901. There is also an internal debt with unpaid interest exceeding the principal. The chief exports are palm oil, palm kernels, coffee, rubber, cacao, sugar, hides, and arrowroot. Trade, which is small and for which few statistics are available, is chiefly with Great Britain. A movement is under way to induce American negro immigration.

LIBRARY ASSOCIATION, AMERICAN, established in Philadelphia, in 1876. The organization seeks to develop the public library in its bearing on American education, to effect reforms and to lessen the expense of library administration. The official organ of the association is the monthly *Library Journal*. It has been instrumental in establishing library associations in twenty-five States. The twenty-fourth general meeting was held at Magnolia, Mass., on June 14-20, 1902, with an attendance of 1018. The associations maintain five sections: cataloguing, college and reference, library work with children, trustees, and State library commissions. These sections hold separate meetings and each prepares programmes arranged by the president and secretary of the section. At the Magnolia meeting a gift of \$100,000 from Andrew Carnegie was accepted, to be used by the publishing board in the preparation of indexes, bibliographies, and reference helps. The publishing board is the most important activity of the association, and published in 1902 an annotated bibliography of American history. It has in preparation an extensive portrait index which promises to be of great service to public libraries. A committee was appointed at Magnolia to arrange for an exhibit by the association at the Louisiana Purchase Exposition at St. Louis in 1904, and will report at the next general meeting at Niagara Falls, June 22-27, 1903. Important papers presented at the Magnolia meeting were "Closer Relations Between Librarians and Publishers," W. H. Page; "Organization and Administration of University Libraries," A. H. Hopkins; "Pains and Penalties of Library Work," A. E. Bostwick. Of special significance were the reports by W. D. Johnston and F. P. Hill of the Congressional Library, on the distribution of catalogue cards and printing of special bibliographies. The officers elected at the twenty-fourth meeting are: James K. Hosmer, president; J. I. Wyer, secretary; Gardner M. Jones, treasurer.

LIFE-SAVING SERVICE, attached to the Treasury Department. Statistics of the service for the fiscal year ending June 30, 1902, showed the following: Total number of disasters, 746; value of property involved, \$14,567,130; value of property saved, \$12,292,795; value of property lost, \$2,274,335; number of persons involved, 4220; number of persons lost, 25; shipwrecked persons succored at stations, 712; number of days' succor afforded, 1272; number of vessels totally lost, 51; number of life-savers lost, 7; disasters to sailboats, rowboats, etc., 361; total value of sailboats, rowboats, etc., \$174,121; value of sailboats, rowboats, etc., saved, \$167,576; value of sailboats, rowboats, etc., lost, \$6545; number of persons involved, 796; number of persons saved, 790; number of persons lost, 6; net cost of maintaining the service for the fiscal year ending June 30, 1902, \$1,654,392.98.

LIGHTHOUSE SERVICE. About \$4,000,000 are now expended yearly by the United States in the maintenance of its lighthouse service and in the construction of new lighthouses. The number and kinds of lights and other aids to navigation employed in the different sections of the country according to the report of the United States Lighthouse Board for the year ending June 30, 1902, are shown in the following table.

AIDS.	Atlantic Coast.	Pacific Coast.	Lake Coast.	Western Rivers.	Total.
Electric lights	4	4
First-order lights	40	18	58
Second-order lights	16	1	3	20
Third-order lights	36	5	24	65
Three and one-half-order lights	3	8	11
Fourth-order lights	185	21	95	301
Fifth-order lights	108	7	44	159
Sixth-order lights	57	47	104
Lens-lantern lights	160	31	101	292
Range-lens lights	16	16
Reflector lights	56	7	63
Post-lantern lights	432	125	126	1,424	2,107
Light-vessels in position	32	3	10	45
Electric-lighted buoys	11	11
Gas-lighted buoys	35	67	102
Total lighted aids	1,191	211	532	1,424	3,358
Fog-signals operated by steam, hot air, or other engines	78	34	76	188
Fog-signals operated by clockwork	198	15	18	231
Day beacons	450	97	1	311	859
Whistling buoys	57	27	84
Bell buoys	109	15	3	127
Other buoys	3,923	364	533	4,920
Total unlighted aids	4,815	522	731	311	6,409
Total number of aids	6,006	763	1,263	1,735	9,767

LINDSAY, ROBERT BURNS, the first governor of Alabama after the reconstruction period, died February 13, 1902, at Sheffield, Ala. He was born July 4, 1824, in Dumfriesshire, Scotland, and was educated at the University of St. Andrews. In 1844 he came to the United States and took charge of an academy in North Carolina. After a few years he removed to Tuscumbia, Ala., where he studied law. In 1853 he was elected to the State legislature, and in 1857 and 1866 to the State senate. In 1860 he was chosen presidential elector by the Democratic convention. He refused to support Breckenridge, however, and became an elector on the Douglas ticket. In 1869 he resigned from the State senate to be the Democratic conservative candidate for the governorship, in which office he served from 1870 to 1872.

LIPPITT, FRANCIS JAMES, an American lawyer and military writer, died in Washington, D. C., September 27, 1902. He was born in Providence, R. I., July 19, 1812, and was educated at Brown University, from which he graduated M. A. in 1830. In the Mexican war he served as captain of the First New York Volunteers, and was made colonel of the Second California Infantry in 1861. In March, 1865, he was brevetted brigadier-general of volunteers. His writings include: *Treatise on the Tactical Use of the Three Arms; Treatise on Intrenchments; Special Operations of War; Field Service in War; Criminal Law in Massachusetts; Physical Proofs of Another Life.*

LITERATURE, AMERICAN AND ENGLISH. *Fiction.*—The fiction for the year 1902 was not distinguished by any special brilliance, in either England or the United States. It produced no single achievement, such as Kipling's *Kim*, to atone at once for a host of inferior productions; it introduced no new writers of the quality which compels immediate recognition, as did the author of *The House with the Green Shutters* in the previous year; it did not even show any well defined new tendencies. It will be remembered chiefly as marking the close of the prolonged and singular vogue of historic romance in this country, and as having witnessed the death of an unusual number of talented writers, such as Bret Harte and Frank R. Stockton of the older generation, and George Douglas Brown and Frank Norris, among the younger writers of promise. Of the novels which deserve specific mention, a larger proportion than usual come from England. Among the veterans of fiction, Thomas Hardy and George Meredith seem to have retired definitely from the field. The former was quite silent; the latter did nothing more notable than to contribute an introductory memoir to a new edition of Lady Duff Gordon's justly famous *Letters from Egypt*. Henry James, however, is represented with a new volume, and so are Mr. Barrie and Anthony Hope and Mrs. Humphry Ward, and the great majority of those whose reputations are already established, although in scarcely any case can the new volume be said to be a substantial advance upon their previous work.

In regard to Mr. James's latest volume, critical opinions differ widely. For some years past, this writer has steadily cultivated a wilful obscurity of style, a verbal eccentricity which renders his writings a sort of intellectual gymnastics. He excels in the art of leaving a thought half uttered, of implying rather than expressing;

of analyzing human motives down to those infinitely small quantities which other novelists disregard—the differential calculus of the emotions. This is again well illustrated in *The Wings of the Dove*. Nowhere is the plot clearly outlined; it is implied in broken phrases and in suggestive pauses. The centre of interest is an American girl, named Milly—a white, frail, red-haired girl, in clinging black, whom Mr. James reveals dimly through a verbal mist, surrounded with the halo of a fabulous fortune. It is impossible to find the page upon which he first implies that Milly is dying; nowhere does he state the fact specifically. Yet dying she certainly is, and the reader is haunted by the knowledge. There is an impecunious young Londoner, a journalist, already engaged to an English girl as poor as himself, when he first comes into Milly's life. But the engagement is a secret, because the English girl's family would have interfered. Just what combination of motives prompt the English girl to loan her lover to the dying Milly is nowhere put into words. It is not the purely disinterested desire to brighten the last days of a dying girl; it is not quite so sordid as a deliberate conspiracy to have her lover marry Milly in order to secure her fortune; the motive lies somewhere between these two extremes. Equally characteristic and individual is Mr. Barrie's latest volume, *The Little White Bird*. It is a tissue of whimsicalities, sentimental and at times rather childish. Yet no one but Mr. Barrie could have woven the day-dreams of a sentimental, lonely old bachelor into a volume of confessions which, while somewhat lacking in cohesion, are possessed of real charm and some little pathos. There is a dainty little governess whose humble romance this old bachelor watches wistfully from the safe vantage-ground of his club window, intervening now and then, like a benevolent fairy godfather to make the course of true love flow smoothly for her. And later on, it is the little governess's son David who is the recipient of the old bachelor's confidences and the chosen comrade of his lonely days. At the hands of a less skillful writer such material might easily have degenerated into mere mawkishness. Mr. Barrie, however, is quite at home in that narrow borderland between smiles and tears—the home of Sentimental Tommies—and he seldom spoils his effects by a false step. There is nothing sentimental about Mrs. Humphry Ward, whose *Lady Rose's Daughter* belongs logically to the fiction of 1902, though its serial course was concluded just too late for the published volume to bear the date of that year. In this book Mrs. Ward has broken quite away from theological problems and the discord of clashing creeds. The atmosphere of the book is the cultured atmosphere of the best London society. The centre of interest is a young woman who, thanks to heredity and early environment, has small reverence for the established conventions of life. To Londoners the name of Lady Rose awakes the memory of a forgotten scandal, long since buried with her in a neglected grave in Belgium, the memory of her flight from home and husband, her years of exile with the man she loved, the birth of a nameless daughter, her death in poverty and neglect. Years later, that daughter, proud, beautiful and well aware of the blue blood in her veins, which she must not acknowledge, works her way into London society as the hired companion of a dictatorial old lady. The world has misused her, and she feels under no obligation to respect the world's conventions. And when two men offer her love, the one a life's devotion, with a proud title and wealth; the other a fleeting joy coupled with dishonor, she chooses the latter with her eyes open. Here, however, Mrs. Ward was not brave enough to shun a conventional ending. She made the other man save the girl, in spite of herself, and later on the girl repents and marries her rescuer out of gratitude.

Since the publication of *Quisante*, Anthony Hope has been consistently working along a single line, contemporary social life, somewhat after the manner of Trollope—and in *The Intrusions of Peggy* he has produced the best example of his later method. It has two distinct claims to attention: it is the first book in which he has introduced women of real flesh and blood—women who show careful study from life; and secondly, it has for its hero a miser, whose passion for money is so strong that he is on the point of letting the woman he loves go to ruin for want of a few hundred pounds; and yet—here is really the *tour de force* of the book—the miser is so deftly drawn, so human and attractive, that he has the reader's sympathy with him throughout the story. As for Peggy herself, although she is not the heroine, her intrusions are always welcome and frequently beneficent. Among the younger reputations there are three writers of widely dissimilar aims and methods—Eden Phillpotts, Arthur Morrison, and Joseph Conrad—whose names, nevertheless, it seems natural to couple together, partly because each in his own line represents a high degree of achievement, partly perhaps because of the chance resemblance between the titles of their first successful books—*Children of the Mist*, *The Child of the Jago*, and *Children of the Sea*. Mr. Phillpotts's latest story is *The River*, another of his simple, rugged dramas of primitive life, redolent of the soil and dealing with men and women who live out their lives in close communion with it. The river Dart dominates the present story, and the author, who has more

AUTHORS WHO DIED IN 1902—(Upper left) Frank Norris. (Upper right) Bret Harte
(Lower left) Paul Leicester Ford. (Lower right) Frank R. Stockton

than a touch of symbolism in his nature, seeks to work out a sort of intimate relation between the changing course of the river and the lives of the people who dwell beside its banks. In the tragic moments, the rapids and whirlpools of life, Mr. Phillpotts always rises to adequate heights; it is in the tranquil periods, the quiet backwaters, the broad, untroubled stretches, that he sometimes spoils his effects by extravagant simile and strained grandiloquence. No such fault can be found with Mr. Morrison. His methods are of the simplest, and he is at his best when describing, in the most matter-of-fact manner, the commonplaces of sordid misery, the pitiful gutter life of London slums. *The Hole in the Wall* goes somewhat outside of Mr. Morrison's chosen haunt. It is not a story of the Jago, but of Wapping and the Ratcliff Highway—the chosen haunt of the English sailor when ashore. The volume takes its name from that of a public house in the heart of the river-side slums, and the plot concerns a stolen pocketbook which passes from hand to hand, leaving a widening trail of blood and crime in its wake. Its crowning catastrophe, concerning a man deliberately blinded with quicklime, is depicted with a realism which, in spite of its strength, is almost too grimly horrible to be admissible in true art. Joseph Conrad is a writer whose course has been steadily upward and onward. In 1902 two volumes came from his pen, *Typhoon*, which was a sort of prose epic of a tropical storm, an Æschylean drama of the elements at war; and *Youth*, a collection of three tales of varying value. "The End of the Tether" is a study of an old sea-captain, who, having outlived his usefulness, faces ruin calmly, fighting to the last. "Youth" is a sort of modern English epic of the sea. Sandwiched in between these two is "Heart of Darkness," which probably represents the high-water mark of Mr. Conrad's talent. Its theme is an impression, taken from life, of the methods adopted by a European trading company for civilizing a certain portion of Africa. But the power of the picture is far beyond anything that a mere analysis can suggest. It is a drama of two continents in conflict, a masterly picture of the white man's greed and the black man's helpless bewilderment in the grasp of his rapacious conquerors. Above all, it reproduces with remarkable power the impression of the glare of African suns, the stillness of African forests, the sense of mystery and isolation and lurking danger that slowly undermine the white man's physical courage and moral sense, and leaves him degenerate and unnerved, equally flabby in body and in conscience. There is a remorseless, unsparing fidelity about Mr. Conrad's picture that is haunting in its sincerity. Another writer who has penetrated the mysteries of an alien civilization is Mr. A. J. Dawson, whose *African Nights' Entertainment* did for the Arab what Kipling's early short stories did for India, and whose new volume, *Hidden Manna*, reveals an intimate knowledge of Moorish life, manners and ways of thinking not to be paralleled in any other English work of fiction. The central figure is one Joseph Hassan, a half-caste already familiar to the readers of his earlier volumes, who left behind him in England several sorrowing women. One of these women, by a strange chance, becomes stepmother of the young master whom Hassan serves, and when in the course of time a son of her own arrives, and she seeks to put out of the way his elder half-brother, this problem arises—shall Hassan aid the woman, by way of reparation, or shall he be loyal to that elder brother, who is his friend and master? The way in which the problem is worked out, as well as the whole atmosphere of the story, proves Mr. Dawson both an acute observer and a trained artist. Lower in the scale, yet very clever in their way, are the group of short Egyptian tales by Gilbert Parker, gathered together under the title *Donovan Pasha*.

There are at least a dozen novels, by writers of recognized ability, which for one reason or another deserve brief mention. *No Other Way* is the title of the last posthumous story by the late Sir Walter Besant. The scene is London in the days when they still imprisoned people for debt; the heroine, a foolish young person who squandered her small fortune, and was confronted with the alternative of the debtor's prison, or of finding a husband to assume her liabilities. The only man available was a burly negro prisoner, under sentence of death, and they were duly married: but condemned prisoners are sometimes pardoned, and that was what happened in the present case. Jerome K. Jerome has so long been recognized as a humorist that a serious story from his pen is an interesting novelty. *Paul Kelver* is a careful piece of work, full of real people and real life. Especially good is the first portion, dealing with the hero's childhood, in spite of a marked tendency toward sentimentality. Less successful is the effort of another novice in fiction, *The Disentanglers*, by Andrew Lang. The title denotes a society organized for the purpose of saving eligible sons and marriageable daughters from marrying undesirable persons. When an impossible engagement looms ahead, one of the "Disentanglers" is sent for, and quietly disentangles the amorous pair by the force of superior attractions. The plot offers a chance for wild, impossible comedy; but Mr. Lang missed his opportunity. Mr. H. G. Wells gives play to his nimble and fantastic fancy in *The Sea Lady*, a novel the heroine of which is a mermaid, with an indisputable

and scaly tale. Benjamin Swift has two new stories to his credit: *Ludus Amoris*, in which a baronet's son masquerades as a groom; and *Sordon*, a new version of the old problem, whether the friends of a man afflicted with a painful and incurable disease, are justified in shortening his term of misery. Mr. Pett Ridge is one of the very few writers who have made an acknowledged success in adopting the methods of Dickens. *Lost Property* is a book after the order of *Mordenly*—the history of a London waif, from the day when, a mere infant, she became "lost property" at the Cannon Street station. The child's life in the slums is well depicted; better still, the next phase in her career, among the small shopkeepers and clerks and Camden Town dandies; for if there is one type in which Mr. Pett Ridge excels, it is the type of London cad. Mr. Robert Hichens's specialty runs to heroines with abnormal proclivities of one kind or another. The heroine of *Felix* is no exception; she is slave to the morphia habit. A story of stronger fibre is *The Four Feathers*, by A. E. W. Mason. It is the story of a young man, destined for the army, who is possessed of a nervous fear that he is a coward. At the outset of his career, he gives evidence of cowardice, and his three best friends bestow upon him three white feathers, to which the girl to whom he is betrothed adds a fourth. The manner in which he redeems himself forms the subject of the volume. Mr. Arnold Bennett is not a new writer; but his earlier volume, *The Grand Babylonian Hotel*, gave little promise of the rugged power of his new book, *Anna of the Five Towns*. In its grimness and its sordidness, it suggests comparison with George Douglas Brown's *House with the Green Shutters*. The setting is the Staffordshire potteries, with all the sombre actualities of smoke-laden air, and the narrowing creed of Wesleyanism. The father of Anna, stubborn, hypocritical, miserly, is the dominant power in these five towns that cluster along a winding road, and he dominates his daughter as well, holding both her and her separate fortune in such an iron grip that she dares not draw a shilling of it without his permission. It is under his direction that she hounds down the man she loves, pressing for payments he cannot make, until he is bankrupt and disgraced. And it is only then that Anna realizes what she has done; but even then her father's influence is too awesome a thing to be shaken off; and she does not try to struggle against it.

There are several volumes by women which deserve a passing word. *Moth and Rust* is the new volume by Mary Cholmondeley, author of *Red Pottage*. The heroine is commonplace, almost stupid; but she is passionately loyal—loyal in her love and in her sacrifice when, to shield the good name of another, she a dying woman, she does the deed that finally separates her from her weak-hearted lover. *Love and the Soul-Hunters*, by John Oliver Hobbes, is essentially a study in temperaments. The heroine is a young girl, chiefly distinguished by "a deep, unchangeable innocence which the knowledge of evil could neither destroy nor mar"; and it is the charm which this innocence exerts upon two men of radically different temperaments that gives the author an excellent chance for her distinctive subtlety and delicate play of irony. Two new writers who deserve to be watched in the future are Violet Jacobs, who has written *The Sheep-Stealers*, and "Miles Amber," author of *Wistons*. The first of these books depicts the borderland between England and Wales, in the days of the "Rebecca" riots, a century ago. Its merit lies in the fidelity of its pictures of rural scenes and characters. *Wistons* is a story of Sussex, and is concerned with the life history of three separate generations of a family in which a strain of gypsy blood has been introduced. Some English critics have suggested a resemblance to the method of Thomas Hardy. Jane Barlow is a writer to whom one looks for at least an annual volume of her inimitable Irish sketches and tales, from the familiar bog-lands of Donegal. Her latest collection is entitled *The Founding of Fortunes*.

The leading American novels of 1902 do not lend themselves readily to classification. If any one type can be said to predominate it is that of the novel of modern western life—a forceful, virile type, of which *The Pit*, by the late Frank Norris, is the most conspicuous example. And yet two of the strongest books of the year, the two which attracted most attention from critics in England, were historical novels, both written by women—*The Conqueror*, by Mrs. Atherton, and *The Valley of Decision*, by Mrs. Wharton. Of the older generation of writers, Mr. Howells, Mark Twain, Mr. Hopkinson Smith, the late Frank Stockton, Mr. Cable and Marion Crawford are each represented by at least one volume. *The Kentons* is a story depicting commonplace people and the trivialities of everyday life with Mr. Howells's usual happy fidelity. The entire routine of the Kenton family is overturned and the habits of a lifetime disarranged by the eldest daughter, who has unwisely bestowed her affections upon a most unworthy object. So the family reluctantly submit to a winter's exile from their peaceful western home, and to the uncongenial atmosphere of New York hotel life, in order to give the daughter time to learn her own mind. Like other heroines of Mr. Howells, Miss Kenton possesses the gift of magnifying molehills of sentiment into veritable mountains,

and the story may best be defined as a record of her success in keeping all her friends and relatives in a continual state of wretchedness. Mr. Clemens's new volume, *A Double-Barrelled Detective Story*, is nothing more than a parody on Dr. Conan Doyle's latest romance, and a rather vague and pointless parody at that. *The Hound of the Baskervilles* was unquestionably the cleverest contribution of the year to the order of detective novels. Its basis was a family tradition of a phantom dog of vast proportions, which appeared to the heir of the Baskervilles on the eve of his death. The reappearance of this dog on the occasion of the late heir's death offered a mystery which Dr. Conan Doyle's famous detective, Sherlock Holmes, promptly undertook to solve. Mr. Clemens's parody opens quite seriously. His hero dedicates his life to hunting down the father whose cruelty has shortened his mother's life. Owing to a pre-natal shock, caused by savage hounds, he is particularly well equipped for his task, being endowed with a bloodhound's keenness of scent. Suddenly, however, Mark Twain betrays that the whole thing is a hoax, by introducing a Sherlock Holmes of his own creating, and turning the story into a burlesque. It is a book which adds nothing to his reputation. Mr. Hopkinson Smith's *Fortunes of Oliver Horn*, on the contrary, is one of the most successful pieces of fiction which that versatile author, artist and engineer has yet produced. It is simply a record of the career of a young southern lad who breaks away from the traditions of his family and refuses to see any degradation in any honest means of earning a living. Many of the scenes are enacted in the studios of New York, and the old Academy of Design, and there is a convincing reality about them which suggests that the author was largely drawing upon a fund of congenial personal memories. The late Mr. Stockton is represented by two volumes: a collection of short stories, called *John Gayther's Garden*, and a whimsical narrative of piracy in the West Indies a century ago, entitled *Kate Bonnet*. The heroine is the daughter of a respectable, middle-aged planter, who through many years of prosaic business life has nourished a wild ambition to become a pirate chief—and his attempt to gratify it results in a series of *opera bouffe* adventures, as preposterous as those of Mr. Gilbert's *Pirates of Penzance*. Just why an author like Mr. G. W. Cable, who is inimitable in his pictures of creole types, and is capable of such delicate pathos as that of *Madame Delphine*, is not content to adhere to his chosen field, but must needs stray so far from home as the elm-shaded streets of a New England village, it would probably puzzle the author himself to tell. *Bylow Hill* is a mildly melodramatic tale of love and jealousy. The successful rival having won his bride by underhand means, is overcome with remorse and finally loses his senses and dies. There is really nothing distinctively New England about the book, excepting the elm trees. The incidents might have happened anywhere. The gift which Mr. Cable lacks, Marion Crawford has in full measure. No matter what corner of the globe he chooses for his stage setting, his atmosphere is always distinctly local, his story definite, his characters vivid and interesting. He writes frankly to entertain, and he usually succeeds. *Cecilia, a Story of Modern Rome*, involves an element of mysticism; the strange mingling of attraction and repulsion which the heroine, a young Italian girl, feels toward the hero, she can explain only on the ground that in a previous incarnation she was one of the vestal virgins, and separated from him by the binding vows of that order. Richard Harding Davis is one of the few writers who can take the soldier of fortune out of his conventional setting of the reign of Louis XIV., endow him with modern implements and modes of war, and yet succeed in making him thoroughly lifelike and convincing. *Captain Macklin* is Mr. Davis's latest addition to his gallery of soldiers of fortune.

The historical novels of the year included a number of popular successes, and at least two instances of careful and conscientious work. Gertrude Atherton took for the theme of *The Conqueror* the "true and romantic history of Alexander Hamilton." Her original intention was to write a formal biography, but gradually, she says, the instinct of the novelist carried her away, and the resulting volume is a novel of American history written in the same spirit of candor and courage that characterizes her stories of modern life. Its defects are the natural consequence of an attempt to adhere too closely to history; for no man's life, however adventurous and heroic, possesses the logical sequences that art alone can give to life. Another volume showing not only much patient research but a rare and sympathetic understanding of an entire epoch, is Edith Wharton's *In the Valley of Decision*. The author's ambition was evidently to sum up eighteenth-century Italy in a single volume—to give in one splendid, comprehensive panorama the physical, moral and intellectual life of that period; just as Stendahl did in the *Chartreuse de Parme*, or as George Eliot summed up the Florence of Savonarola in *Romola*. The resulting volume is unfortunately rather ponderous. It is weighted down with erudition. Mrs. Wharton was so engrossed in painting in her background, filling in historical detail, saturating her pages with the artistic atmosphere of the times, that she failed to give her central characters that vitality and human interest essential to fiction of the

highest type. Her volume leaves the impression of a monograph on social history rather than a romance of human lives. It is written, however, with all the dexterity and unflinching grace of style characteristic of the author of *Crucial Instances*. Among the historical romances of the conventional type that won popular favor, Miss Mary Johnston's *Audrey* deserves a word of commendation. It was a romantic tale of colonial Virginia, after the manner of *To Have and to Hold*; but in addition to this it was an interesting and careful study in feminine psychology. Charles Major, on the contrary, whose earlier volume, *When Knighthood was in Flower*, well deserved the cordial praise which it received, fell far below the standard he had set himself, in his new story, *Dorothy Vernon of Haddon Hall*, which was a sadly disappointing piece of work. *The Mississippi Bubble*, by Emerson Hough, a tale of John Law and the epidemic of speculation under the Regency; and *The Strollers*, by Frederick Isham, a story of theatrical life, on the road, a century ago, are two volumes conspicuous among the season's popular successes.

Much of the best talent in this country is being devoted to novels of the West—either the strenuous pioneer life of the plains, the mines and the forests, or the equally interesting social life of western cities, where the veneer of culture is still comparatively thin. Two notable examples of their respective types are *The Virginian*, by Owen Wister, and *The Pit*, by the late Frank Norris. In spite of the number of books embodying the cowboy in all possible forms, from the roughest caricature to the most photographic fidelity, there was hitherto no one story which could be pointed out as the novel, *par excellence*, of the cowboy. This at last Mr. Wister has produced. His *Virginian* is a frankly idealized type of all that is best and most truly American in the representative cattlemen of the western ranch. It is a portrait rather than a novel. The underlying thread of romance is of minor interest; what one does care for is the personality of the *Virginian*, his rugged sincerity, his inborn sense of justice and honor and fair play, his natural courtesy to women, his unflinching fund of humor, his soft southern drawl, curiously contradicted at times by the virile activity and alertness. As a novel, *The Virginian* undoubtedly shows structural weakness. As a picture of a phase of American life that is rapidly passing away, it is a book that will not soon be forgotten. Other rugged stories of the west that deserve mention are *The Blazed Trail*, a tale of the lumber regions, by Stewart Edward White; and *In the Country God Forgot*, by Frances Charles—a grim picture of human lives warped by the parching sterility of the Arizona desert lands.

Whatever else may be said for or against the late Frank Norris, it must be conceded that he came nearer than any other writer of his generation to reproducing in English the epic bigness of theme and the epic sweep of style that characterized the novels of Emile Zola. Norris was never satisfied with half-way measures; he was not happy until he found a symbol that would sum up in a single word all American life—Wheat; and he was so engrossed in this central symbol that he made the mistake of subordinating everything else to it. Zola could paint vast cycloramas, but in them the actors in the central tragedy always stood out in sharp relief. In *The Octopus* of Norris the principal actors seem to sink into the background, to lose themselves and become submerged under the waving fields of yellow grain. *The Pit*, Mr. Norris's last book, finished just before he died, is in this respect a notable forward stride. Wheat is still the symbol, but it is subordinated to the interest of human actors in the book. It is a story of the attempt of one man to corner the wheat market of the world. He buys and buys and the price soars steadily up; he holds on through April and May, and his fortune seems made. He holds on a day too long, and all of a sudden the new wheat comes pouring in, an overpowering flood, rising higher and higher, gradually submerging the man who is depicted standing there, like a feeble insect, striving with outstretched hands to hold back the granaries of the world. No other story of Chicago can fairly be placed in the same category. But a story which deserves to be widely read is George Horton's *Long Straight Road*. It deals with the dull monotony of humdrum married life, the dreary prospect of endless to-morrows each as sordid and as hopeless as to-day, in the homes where there are scanty means and still scantier affection. There is just one thing that relieves the sombreness of the picture, and that is the laughter and the joyous, irrepressible voices of little children, that echo through the pages and refuse to be shut out of them, just as they refuse to be silenced in real life.

Biography.—The biographical works for 1902 are not only more numerous, but also more important on the literary side than on that of history. Sidney Lee's important *Life of Queen Victoria*, expanded from his article in the *Dictionary of National Biography*, bears evidence of its origin, being more distinguished for its accuracy and comprehensiveness than for its charm of style. The facts of the late queen's life, however, were of a kind that may safely be left to speak for themselves; and until the appearance of the authoritative biography which is being prepared by royal command, this is probably the most satisfactory account that can be produced.

Another contributor to the *Dictionary of National Biography*, Mr. A. F. Pollard, provided the text for a sumptuous volume upon Henry VIII., more notable for its artistic merits than for historic excellence. Mr. Pollard's monograph shows conscientious labor, but his independent judgments do not appear to have been particularly inspired. His general impression of the king seems to be that, while he had a "peculiar conscience," he did such important work in the world that he could not have been altogether unscrupulous. Mr. Andrew Lang, who delights in solving historical puzzles, finds a congenial theme in *James VI. and the Gowrie Mystery*. It was an old Scottish lady of a century ago who said that it was a great comfort to think that "at the day of judgment we should know the whole truth about the Gowrie Conspiracy." Mr. Lang seems to have anticipated the Day of Judgment. With the aid of hitherto unpublished documents he has established to the satisfaction of at least a portion of his reviewers that "the Earl of Gowrie and his brother laid a trap for King James, and fell into the pit which they had digged." Mr. W. H. Wilkins was already known as the author of the sombre story of King George II.'s mother, *The Love of an Uncrowned Queen*, before the appearance of a biography of the same monarch's wife, *Caroline the Illustrious*. It is a readable volume, but of no great historic value, the great bulk of its contents being already accessible elsewhere. One English critic goes so far as to say that the second of Thackeray's lectures on *The Four Georges*, short and scrappy as it is, is more instructive and more accurate. A noteworthy contribution to Napoleonic literature is a *Life of Napoleon I.* by John Holland Rose. It is a scholarly and well-founded record, biographical rather than historical, and especially valuable because, without the omission of any really essential matters, the whole story is condensed to a readable length. The principal adverse criticism has been directed against Mr. Rose's neglect of the personal side of Napoleon's character: "Apart from his brilliant conversations," he says, "his private life has few features of abiding interest." But he sums up his subject as "the wonder worker who bridled the French Revolution and remoulded the life of France," the man who "must ever stand in the very forefront of the immortals of human story." The London *Athenaeum* goes so far as to predict that Mr. Rose's volume will become the authority for English readers.

Biographies of soldiers and statesmen are not numerous. Sidney Whitman contributes a volume of *Personal Reminiscences of Prince Bismarck*, well written and readable. *Cecil Rhodes; A Study of a Career*, by Howard Hensman, is a careful and satisfactory study of a man whose personality has been hitherto comparatively little known. The author sums him up as "a mass of inconsistencies," a great opportunist, and although often headstrong, capable on occasion of great diplomacy. The history of the famous Raid is told with frank impartiality, and apparently gives the true story without reserve. A prolonged echo of the Boer war comes in the shape of numerous biographies and memoirs of leaders in the struggle. *The Memoirs of Paul Kruger, Told by Himself*, is a discursive narrative, going back to the earliest memories of "Oom Paul's" childhood, a long-winded justification of the author's share from first to last in moulding the fortunes of the Transvaal, and revealing on every page the author's strong bias and vindictive bitterness against England. It offers a rather curious contrast to another volume which appeared almost simultaneously with it—General De Wet's *Three Years' War*, written with the crisp military directness of a man who has formed his style from writing military dispatches on the battlefield, and whose sentences and paragraphs often have the sharp rattle and abruptness of firearms. There is nothing of the special pleader in General De Wet's book. It is simply a plain, unvarnished tale, thoroughly sincere and often eloquent by its very brevity. Of the two books, it is certainly the broader-minded.

The biographies of well-known writers are uncommonly numerous. The list includes the sympathetic two-volume life of Lowell, by the late Horace E. Scudder, which admirably supplements the two volumes of Lowell's Letters, edited a few years ago, by Professor Norton. Mr. Scudder's lifelong intimacy with Lowell fitted him for writing just the sort of biography that was most needed. Of Lowell's position in letters there is not very much room for discussion; but his life was so rich in associations, his contemporaries and associates included so many men who have helped to make New England famous, that it is the personal side even more than the literary which interests the general reader. And it is this side Mr. Scudder has done ample justice. A kindred interest attaches to the *Autobiography* of Sir Walter Besant. One of the last survivors of his own generation of novelists, he had for fully two score years been closely associated with the London literary circle; while his warm espousal of the cause of young writers, and his persistent efforts to establish a system of fair dealing between author and publisher, all go to make his personal account of his life an important document in the history of English letters during the second half of the nineteenth century. There have been a number

of recent additions, of very uneven merit, to the well-known English Men of Letters series, founded by Mr. Morley. Augustine Birrell contributes a volume upon William Hazlitt, whose name was one of the few notable omissions from the earlier series. As a biographer, Mr. Birrell has acquitted himself well of his task; but from the critical side his work is disappointing. He has very largely shirked the difficult task of estimating Hazlitt's position and worth as a literary critic. Herbert Paul's *Matthew Arnold*, in the same series, is a bright, readable little volume, written in an agreeable, epigrammatic style. As a critical estimate of Arnold's greatness, however, whether as poet or essayist, it has been pronounced inadequate. Sir Arthur Lyall's *Tennyson* has been summed up as an old-fashioned volume, sound in judgment, and free from exaggeration. It is a scholarly appreciation, adapted to the needs of the series, although it does not add anything especially new. Thomas Wentworth Higginson is author of the volume upon Whittier, which although sympathetic is little more than a compilation, and consists so largely of copious extracts from Whittier's poems as to give the impression of an autobiography. The same comment applies in a measure to a far more able and comprehensive work, *Charles Dickens, His Life, Writings and Personality*, by Frederick G. Kitton. It is written in a vein of contagious enthusiasm, fearlessly bringing out the intimate details of Dickens's life, quoting the thousand and one idle utterances of the moment, little absurdities of personal taste, a strange medley of incidents, from which the novelist's character shines forth with strange and unexpected clearness. George Meredith is the subject of a small monograph which its author, Walter Jerrold, calls "an essay towards appreciation," but which has been pronounced too indiscriminating to be of special value.

The Dumas centenary naturally bore fruit in the shape of biographies and critical appreciations; and perhaps the most valuable contribution from English sources was the volume *Alexandre Dumas, Père, His Life and Works*, by Arthur F. Davidson. It is the product of fifteen years of careful study, and has been already pronounced both well written and authoritative. The author has not attempted to veil or extenuate Dumas's well-known weaknesses, but he has sought to do full justice to the nobler side of his character. The facts are drawn freely from Dumas's own personal narrative, with the result of making the book as entertaining as fiction. On the other hand, it is weak and unsatisfactory from the side of literary criticism. Two other volumes which deserve at least a passing record are *Tolstoy, His Life and Work*, by John Coleman Kenworthy; and *Maxim Gorky*, by E. J. Dillon, who gives the impression of knowing the Russian people and literature with some thoroughness, and of being well qualified to discuss the personality and the writings of the recently discovered "tramp-novelist."

Criticism and Essays.—Professor Saintsbury's valuable and comprehensive *History of Criticism and Literary Taste in Europe* has been augmented by a second volume, covering the period from the Renaissance to the Decline of Eighteenth Century Orthodoxy. Covering as it does only three centuries, it admitted of more unity of treatment than the earlier volume. This period witnessed the rise and fall of the neo-classic theory of criticism which for a time dominated Europe, and whose chief representatives in England were Dryden, Pope, and Johnson. The admirable "Library of Literary Histories," which already included volumes upon India and Ireland, has been increased by a *Literary History of Persia*, by Edward G. Browne, who brings his subject down to the time of Firdausi, reserving for another volume the consideration of later Persian writers. This is a work of considerable importance, being really a pioneer work in the field, both on the historical and the literary side. Volumes of critical essays are represented by contributions, among others, from W. C. Brownell, George Paston, G. K. Chesterton, and Sir Leslie Stephen. Mr. Brownell has gathered together six essays into a volume of *Victorian Prose Masters*, including Thackeray, Carlyle, George Eliot, Matthew Arnold, Ruskin, and George Meredith. Mr. Brownell undoubtedly has decided limitations in his sympathies and in his comprehension; and his style is often heavy and none too lucid. Yet even his most unsatisfactory judgments contain something that is both stimulating and instructive. George Paston has produced two volumes of miscellaneous essays within the period of the year, *Little Memoirs of the Nineteenth Century*, and *Sidelights on the Georgian Period*, the former consisting of a series of delightful little biographical vignettes, the latter a more miscellaneous collection of papers ranging from "A Burney Friendship" to "The American in England," a study of the Spanish scholar and Harvard professor, Ticknor. And in all there is the same familiarity with the period and the same easy, cultured, agreeable style. Sir Leslie Stephen has continued his *Studies of a Biographer* with a second series, the studies ranging all the way from Stevenson to a curious minor philosopher, such as Godwin was. No survey of the year's essays would be complete without some mention of *Twelve Types*, by G. K. Chesterton, author also of *The Defendant*. As far as sheer cleverness goes, Mr. Chesterton is attracting considerable attention

in England. He is a thinker of some power, he has the gift of clear expression, and what he says is not merely readable but stimulating. His chief fault is over-confidence and self-assertion. In *Twelve Types* he passes judgment successively upon Savonarola and Scott, St. Francis and Tolstoy, all with the same air of infallibility. Boldness, however, is so rare among the writers of to-day that Mr. Chesterton's very recklessness has won him favor among English critics. A novelist like Mr. Howells is never more entertaining than when he consents to talk frankly and genially about his own theories and methods of work. *Literature and Life* is Mr. Howells's latest volume of essays, dealing with a heterogeneous collection of subjects, ranging from the little queen of Holland to a country circus. A few only of the papers included touch upon literary methods; but all throw interesting light upon the author's present mood. There is apparent throughout a lack of enthusiasm, a sober monotone which explains why the novels of Mr. Howells's later manner are so much more commonplace and humdrum than those of his earlier and more impetuous days—the days of *April Hopes* and *Silas Lapham*. *The Unspeakable Scot*, by T. C. Crosland, an English journalist, is a collection of essays whose intent is indicated by the title. It evoked much controversy and some pique on the part of Scotchmen. Throughout his attack the author gives the impression of trying to annihilate by sheer vociferousness.

LITTLEFIELD, CHARLES EDGAR, congressman from Maine since 1899, attracted wide attention during 1902 by his advocacy of legislation for the control and regulation of trusts and corporations. He was born June 21, 1851, at Lebanon, York County, Me. He received a common school education in the schools of his native village, continued his studies privately, and after reading law for some time was admitted to practice in 1876. He entered political life in 1885 as a member of the lower house of the Maine legislature, was chosen speaker in 1887, and in 1888 was elected attorney-general of the State, serving from 1889 to 1893. On June 19, 1899, he was elected a member of the national House of Representatives at a special election called to fill the vacancy caused by the death of Nelson Dingley. He was re-elected in 1900 and 1902.

LIU-KUN-YI, Viceroy of Nanking, China, died on October 15, 1902. He was born about seventy-five years ago, and although in his youth he lacked some of the advantages of Chinese literary training, made his way to the front by his intellectual ability and independence of character. After occupying several minor official positions he came prominently into notice upon his appointment as viceroy twenty-five years ago, at once manifested an interest in western influence and methods, and was in favor of their cautious and experimental introduction into China. In his province he organized the military and surrounded himself with an army of 20,000 men, which gave him the greatest advantage in enforcing order and enabled him in 1900 to prevent his disaffected subjects from joining the Boxer movement. Though loyal to the Manchu dynasty, he strongly disapproved of the unreasoning conservatism of the official class surrounding it, and favored a more modern organization of government. He was recognized as one of the few great Chinamen who combined a just appreciation of foreign methods and institutions with good judgment as to the extent in which they were useful to his country.

LIVE STOCK. See AGRICULTURE, and DAIRYING.

LORENZ, ADOLF, professor of surgery in the University of Vienna and head of the orthopædic department in the General Hospital of Vienna, visited the United States during the latter part of 1902 and performed many operations by his "bloodless method" in cases of congenital dislocation of the hip. Dr. Lorenz was born in northern Austria in 1854, and was educated in the schools of his native district and the University of Vienna, from which he graduated in 1880. Having a predilection for surgery he devoted himself to this, becoming the assistant of Professor Albert in the university. His hands became covered with eczema caused by the necessary antiseptics, and consequently he was prevented from following general operative work, and at the advice of Professor Albert he devoted himself to orthopædic surgery. His first important achievement was the improvement and development of the method of reducing congenital dislocation of the hip bone first demonstrated by Professor Hoffa of Würzburg in 1890. This was a very difficult and bloody operation, involving the cutting of many muscles and the hollowing out of the socket for the hip bone. By stretching the muscles and forcing the head of the hip bone into its proper place Dr. Lorenz was able to accomplish the same result with less cutting and the operation was known as the Hoffa-Lorenz operation. After several operations he determined to trust entirely to manipulation and in 1895 demonstrated his method to the Medical Congress in Berlin. Dr. Lorenz came to the United States at the invitation of J. Ogden Armour, of Chicago, to operate upon his young daughter, but in addition gave clinical demonstrations before the surgeons and students of many cities where he stopped, and was received with enthusiasm by both the medical

profession and the laity. His operations on the poor in metropolitan hospitals were greatly appreciated by the public, and by vote of the board of aldermen of New York City, the freedom of the city was conferred upon him. In England he was received with less enthusiasm.

The so-called "bloodless method" of reducing congenitally dislocated hips, while not original with Lorenz, has yet attained in his hands a degree of success that no other surgeon had reached. In cases of this nature, the head of the thigh bone (femur) lies out of and above its socket on the surface of the hip bone (ilium), and is held there by ligaments and the shortened and contracted muscles. The socket from disuse is usually undeveloped and shallow. Lorenz's method in brief, is to break up by forcible manipulations the adhesions, and to tear or stretch the muscles and other soft tissues so that the bone may be pulled into place again. This being done the limb is extended in the direction of its long axis and powerful traction made by assistants while the surgeon guides the head of the bone into its socket. When the head reaches the proper position the limb is quickly abducted and rotated outward, and the head slips into place with a snap. It is retained in position by a plaster splint encircling both hips, which is worn for months, the child being meanwhile encouraged to run about to fix the head more firmly into its socket. Operating by this method Lorenz had no deaths in Austria, and a smaller proportion of failures than by the older operations, in which the knife was used to divide rigid muscles. That the operation is not without danger, however, has been abundantly demonstrated during the visit of the Vienna orthopaedist to this country. In an editorial article in the *Journal of the American Medical Association* it is stated that out of the few carefully selected cases operated on in Chicago, there was one instance of fracture of the femur, one of extensive hematoma (blood tumor), and one of extensive laceration of the perineum. Lorenz also reports three deaths from chloroform anæsthesia in 360 cases—doubtless the result of the enormous shock incidental to the necessary manipulations. For a description of Lorenz's personality, appearance and action in the operating room, consult Ferris's "Adolf Lorenz and His Work," in the *Medical Critic*, New York, December, 1902.

LORM, HIERONYMUS. The pseudonym of Heinrichs Landesmann (q.v.).

LOUISIANA, a gulf State of the United States, has an area of 48,720 square miles. The capital is Baton Rouge. Louisiana was part of the territory sold to the United States by France in 1803, and was admitted as a State April 30, 1812. The population in 1900 was 1,381,625; in June, 1902, as estimated by the government actuary, it was 1,438,000. The population of New Orleans, the largest city, was 287,104 in 1900.

Finance.—The balance in the treasury of Louisiana January 1, 1901, was \$1,305,691.64. The receipts during the calendar year 1901 were \$3,892,308.27, the expenditures, \$3,775,567.75, and the balance December 31, 1901, \$1,422,432.16. The State debt at that date was \$10,877,800, all bonded. No figures for 1902 were available.

Agriculture and Industries.—Cotton, the most important crop of the State, yielded more in 1902 than in 1901, but was still considerably below the ten-year average. Cotton receipts at New Orleans from September 1 to December 31, 1902, were 1,374,053 bales, as against 1,327,093 and 1,509,916 bales respectively for the corresponding months of 1901 and 1900. The Census Bureau reported 2145 gins in the State December 13, 1902, and 670,485 bales already ginned. The amount remaining to be ginned was estimated at 159,908 bales. This would make the 1902 crop 830,393 bales. The census reported 709,041 bales for 1899. The Department of Agriculture reported 262 pounds per acre in 1902. The value of the crop was estimated at \$35,000,000. Willet and Gray place the 1902 sugar crop at 250,000 tons against 310,000 tons in 1901. The average price of raw sugar during the year was 3.54 cents per pound, which would make the 1902 crop worth \$17,710,000. The decreased yield was due partly to a smaller acreage and partly to dry weather in the early summer. Inasmuch as Louisiana produces much more sugar than all the rest of the United States, impending reciprocity with Cuba was the all-absorbing topic among sugar growers. The most important development in the State was the increase in number of the irrigated rice-fields in the western part of the State. The investment of Northern and Western capital in irrigation canals and pumping plants continued as rapidly as in the two or three years preceding. Although the season was very unfavorable for rice in 1902, the total yield was considerably larger than in the preceding year because of increased acreage. The rice shipments up to the end of 1902 reached 949,785 sacks, as against 898,628 sacks for 1901. The total crop of rice in 1901 was 1,397,460 sacks. The drought in the early summer of 1902 not only injured the fields which cannot depend wholly on irrigation, but in places caused an insufficient supply of water for the irrigating canals because of the rapid growth of irrigating systems, causing a depletion of the more available streams. Early estimates valued the 1902 crop at \$9,000,000. The *Crop Reporter* shows a corn crop of 16,784,762 bushels,

valued at \$11,077,943, from an acreage of 1,342,781 acres. The horses in the State January 1, 1903, were valued at \$8,708,344; mules, \$11,797,399; milch cows, \$4,086,356; other cattle, \$4,635,570; swine, \$3,334,795.

Among industries, lumbering showed much activity. New Orleans increased more in importance as a grain and cotton market than any other port on account of increased railroad facilities, while the development of the Beaumont oil field greatly increased financial transactions in New Orleans during 1902. Bank clearings in 1902 were \$677,111,109, as against \$602,264,116 in 1901.

Railroads.—According to the last report of the Louisiana Railroad Commission the total railway mileage in the State of Louisiana at the end of the fiscal year 1901 was 2662 miles; for 1900 the mileage was 2425.4 miles. The gross income of railroads for Louisiana was \$17,120,223.41 for the fiscal year 1901. New construction in 1902 amounted to 170.56 miles according to the *Railway Gazette*.

Legislation.—The regular biennial session of the General Assembly of Louisiana convened on May 12, 1902. Several important laws were passed, including a revision of the banking laws and a reorganization of the educational administrative statutes.

The amended banking laws provided, among other things, that companies doing a trust banking business should not have power to issue notes as previously; that they should have at least \$100,000 paid in capital instead of a minimum capital of \$10,000, and that they keep on deposit partly in their own vaults and partly with other banking institutions, at least 25 per cent. of their demand deposits; but savings banks deposits subject to a withdrawal notice should not be construed as demand deposits.

The revised educational act created a State board of education to consist of the governor, the superintendent of public instruction, the attorney-general, and seven other citizens, one from each congressional district, appointed by the governor. The State board was authorized to appoint for each parish in the State except that of Orleans, a board of parish directors, to prepare rules for the government of the public schools of the State, to prescribe uniform text-books, to require reports from the parish school superintendents, and to have the power of dismissal for cause. The direct supervision of the public schools was to vest in the State superintendent and in the parish superintendents. Parish school boards were authorized to establish graded schools and central or high schools when necessary. Minimum curricula were prescribed by the act for elementary schools. In order to aid those teachers who had not had the advantage of a professional training and who could not for any reason pursue the full course at the State normal school, summer normal schools with sessions of not less than four weeks each were directed to be established. All apportionment of funds appropriated by the legislature for educational purposes were directed to be distributed by the State superintendent, and the local authorities of parishes, cities, and towns were authorized to levy a tax of not exceeding six mills. All the public schools of the parish of Orleans were placed under the control of a board of directors consisting of twenty members, eight of whom were to be appointed by the governor and twelve by the city and council of New Orleans. A law of 1877 prohibiting the police juries of parishes or municipal corporations from making any appropriations in excess of the actual accruing revenue of the year, or of issuing warrants or evidences of indebtedness except against money actually in the treasury, was modified in 1902 to prohibit such juries or corporations from making appropriations in excess of the estimated revenues. These revenues were to be applied in order: (1) To statutory charges; (2) to payments under time contracts; (3) to usual and necessary indebtedness incurred by ordinance and resolution. Any estimated excess of income over and above these charges might be anticipated in contracts made for public improvements and bonds issued therefor; such bonds should be payable in ten years and should not bear more than 5 per cent. interest. In case of emergency, municipalities were authorized to borrow money, but its repayment should constitute a fixed charge in the following year.

Among laws affecting commerce and industry passed by the legislature were the following: The right to borrow money already given to various semi-public corporations and to sugar and rice mills, was extended to cotton and other manufacturing concerns; an act to provide for the organization, regular supervision and inspection of local and foreign building, building and loan, or homestead associations or companies, and defining their rights, powers, and privileges; an act prohibiting insurance companies from authorizing or allowing non-residents of the State to act as their agents or representatives in the issuing of policies in the State; an act defining banking associations and savings banks and directing that they must be organized by citizens of the State, and prescribing more stringent rules and regulations for their operation; an act authorizing police juries throughout the State to sell and grant franchises on public roads for the construction of electric railways; an act authorizing all municipal corporations having less than 50,000 inhabitants to regulate local pool rooms and turf exchanges; an act creating boards of examiners of plumbers and providing that all plumbers should be licensed by this board; an act

creating an oyster commission of five persons to be vested with power to regulate and develop the oyster industry; all the beds of rivers, creeks, and bays connecting with the Gulf were declared to be held in common for the equal benefit of residents of the State; the closed oyster season was declared to be from May to October inclusive; the use of dredges was prohibited; and the commission was directed to lease oyster lands under proper conditions and an armed patrol was authorized to see that the law was enforced. Railroad corporations were authorized to construct roads in Louisiana and to buy or merge with other railway lines excepting those which were competing and parallel. Street railway companies were directed to provide separate cars or separate portions of cars for white and colored passengers. Passengers who do not obey the provisions of this act were made subject to fine, and officers and employees were also made amenable to fine or imprisonment if they did not observe the law. Practically all of the Southern States have enacted that steam railway companies should provide separate accommodations for whites and blacks, but enough opposition has hitherto been made on the score of expense by street railway companies to prevent an extensive application of the same law to street railway companies. The hours of labor to be permitted by law on street railways was changed from a maximum of twelve hours with one-half hour off for dinner, to a maximum of ten hours to be embraced within twelve consecutive hours.

Other acts passed by the legislature were as follows: The course of the governor and his protest to the President was approved respecting the alleged use by the British government of the ports and waters of Louisiana as a base for obtaining military supplies to be used in the South African war. The power of aldermen and mayors was increased in cities, towns, and incorporated parishes consisting of from 1000 to 2000 inhabitants. The time for holding elections in the parish of Orleans and city of New Orleans was changed from the odd to the even years, the next election to be held in November, 1904, and every fourth year thereafter. The governor was authorized in his discretion to direct the State examiner of banks to examine at any time the accounts of any State or district officer, board, or employee.

A State insurance board was created to consist of the governor, auditor, and treasurer, to take over the insurance on behalf of the State of all public buildings, collecting the premiums as if they constituted a private company and investing the surplus if it seemed wise, in bonds of the State of Louisiana or of some political subdivision thereof. A firemen's relief fund was authorized to be established in the city of New Orleans for the pensioning of disabled firemen and the widows and orphans of deceased firemen, and a board of trustees was created to draw up the necessary regulations. A board of commissioners was established to consist of three members to confer with similar boards created by other States for the purpose of considering and drafting uniform laws where uniformity is desirable in the laws of the various States and Territories, and where the subject matter is outside of the jurisdiction of Congress. A board of commissioners consisting of the governor and four other members was created to take charge of the exhibit of Louisiana at the Louisiana Purchase Exposition, and \$100,000 was appropriated to be expended under the direction of the board. An insane asylum for colored persons was directed to be established and a board of administrators to consist of eight members was created.

In accordance with the provisions of the revised constitution of 1898, misdemeanors and minor offenses were graded by enactment of the General Assembly and minimum and maximum penalties prescribed. Another act directed that minors under sixteen should be kept separate from other prisoners and should have a separate trial, and a further law directed that prisoners who had never before been convicted might by specially meritorious conduct receive double the amount of commutation authorized by previous laws.

June 3 of each year was declared to be a legal holiday, to be called Confederate Day. The senators and representatives of Louisiana in Congress were urged to secure the passage of an act refunding to the Cotton States the amount collected under the unconstitutional cotton tax from 1865-67 inclusive, and amounting, as was estimated, to \$66,000,000. An amendment to the constitution was proposed, to be voted on at the November elections, making changes in the regulations governing the supreme court and the court of appeals, and also proposing that that article of the State constitution be stricken out which directed that no person between the ages of twenty-one and sixty should be permitted to vote who had not paid his poll tax for the two years preceding.

The general law governing the sale of liquor and providing local option was changed at the session of the legislature in 1902. The law now provides that whenever a police jury orders an election to ascertain the opinions of the voters of a parish regarding the sale of liquor, the result of such an election shall govern the actions of all municipal corporations, and that no municipality shall have the right to sell intoxicating liquors if the general election throughout the parish prohibit such sale, until another election shall be ordered by the police jury of the parish and a

change in the sentiment of the people of the parish, as recorded at the polls, shall occur.

Suits and Legal Decisions.—John Hyde, statistician of the Department of Agriculture, brought suit, on February 25, against H. & B. Beer, cotton factors of New Orleans. In a cable despatch to Liverpool, they had stated that in view of the fact that Congress was investigating irregularities in his department, suspicion attached to the estimates issued by him. Hyde claimed that the report was untrue, and had seriously injured his reputation.

Miscellaneous.—Early in April, Governor Heard reported to Secretary Hay that the British government, whose agents were buying horses and mules in Louisiana for the army in South Africa, had established a "camp" near New Orleans. Upon investigation, it was found that his fears were groundless, the camp being simply a place where the animals were received and temporarily kept, and that neutrality laws had not been violated.

Revival of the "Star Car."—The question of reviving the old "Star Car" idea, which provided separate cars for negroes, was discussed seriously during the year. Finally, on November 4, a "Jim Crow Car" law went into operation. One writer says: "For some years past there has been a steadily increasing demand for separate cars. The advocates of the measure claim that the negroes, as a race, are reverting to hoodlumism, if not to actual barbarity; that their street manners have been rapidly deteriorating under the dispensation of freedom; that it is no longer safe to permit all colored men to enter cars in which there are ladies and children, and that since it would be unsafe to intrust conductors with the right or the duty of discriminating, the taboo must be drawn against them all. They show that the blacks have been actually free more than thirty-five years; that they have had every opportunity of education and advancement; that for nearly a decade they held control in politics and government. And now, as the argument runs, they find the negro lower in the social scale than he was during the era of slavery. His morals are lower, his criminal record infinitely more discouraging, his condition from every point of view deplorable. They cannot legislate him into frugality, self-respect, good behavior, or civilization, but they declare that they will endeavor to contract the field of his objectionable activity. The proposed law as outlined in the New Orleans papers is very carefully drawn, and promises a most effective operation. It provides for the arrest and punishment of any and every one who attempts to violate it, and it imposes heavy penalties on street-car companies whose officials neglect the least of its injunctions. The spectacle of New Orleans resurrecting, after a generation of disuse, the old, half-forgotten star cars of 1866, contains much food for disturbing thought. It proves, at least, that the community is convinced of the necessity of the expedient."

The legislature of Louisiana met in May and re-elected Samuel D. McEnery as United States Senator for the full term of six years commencing March 4, 1903, and ending March 4, 1909.

State Officers.—For 1901 and 1902: Governor, W. W. Heard, elected for four years, term ending April, 1904; lieutenant-governor, Albert Estopinal; secretary of state, J. T. Michel; assistant secretary of state and commissioner of insurance, Eugene J. McGivney; auditor, W. S. Frazee; treasurer, L. E. Smith; attorney-general, Walter Guion; superintendent of education, J. V. Calhoun; land commissioner, James M. Smith—all Democrats.

Supreme Court: For 1902 and 1903: Chief justice, Francis T. Nicholls; associate justices, Joseph A. Breaux, Newton C. Blanchard, Frank A. Monroe, and Olivier O. Provosty—all Democrats.

For congressional representatives, see UNITED STATES (paragraph Congressional Representatives).

LOUISIANA PURCHASE EXPOSITION. During 1902 the work of preparation progressed rapidly. The organization for all departments was perfected. The site, which was chosen in 1901, was handed over in due course, and much of the ground, embracing an aggregate of 1190 acres, was graded and prepared for construction purposes. According to the perfected plans, the exhibits are to be placed in fourteen buildings. Of these, two were nearly finished before the end of the year. Several others were well under way and arrangements were in progress for speedy erection of all others. To carry on this work, and also the equally intricate task of the publicity department (see FRANCIS, DAVID R.), about \$2,000,000 were expended and contracts to the extent of about \$5,000,000 were signed. In accordance with the restrictions laid down regarding control of the finances, the sums paid out were not taken from the federal appropriation. This will not be touched until the corporation's expenditures reach \$10,000,000. An immense structure, having twice the frontage of the treasury building at Washington, is to be erected in behalf of the United States government. The site has been laid out and graded for building purposes. According to the plans, the agricultural building will be the largest ever

erected for a single exposition exhibit. One of the most interesting facts so far announced concerning space for exhibits is that 200,000 acres, covered, will be available. The exposition buildings are being arranged in a semicircle fully a mile and a half in length, the whole series fronting upon terraces and cascades. The intermural transportation system in course of construction will be nearly eight miles long. During the year the list of States and Territories certain to participate was brought up to eighteen. Their contributions in the shape of appropriations exceeded \$2,500,000. Notifications were also received from twelve other States and Territories to the effect that they intended to support the enterprise in a practical way. The promised subscriptions from these latter reached nearly \$1,500,000. The governors of twenty-five States and Territories notified the managers that the legislatures, meeting during the winter of 1902-03, would consider bills for appropriations in support of the exposition. Commissions were appointed in thirty-one States and Territories to cooperate with the exposition authorities, and action of a similar character was contemplated in nearly all the remaining States. One of the special and original features of the exposition was developed during the year and promises to become a great attraction. It includes exhibits from the Philippines, Porto Rico, Hawaii, Guam, and Samoa. There will also be an exhibit from Alaska. The foreign exhibit arranged for in 1902 includes Cuba, and nearly all of the Central and South American Republics, Great Britain, Germany, France, Mexico, Canada, Japan, China, Greece, Belgium, Switzerland, and several others. Some who declined on first invitation because they deemed the time for preparation too short, reconsidered their decision on learning that Congress had postponed the actual opening until 1904. The aim of the exposition authorities is to introduce as many special and original features as possible. In pursuance of this policy, arrangements were made for an airship tournament, with a prize of \$100,000 for the winner and other prizes aggregating \$100,000 more, for less successful competitors. Before the end of the year many applications from exhibitors, anxious to display and compete, were received. They included representatives of the two great schools of aeronauts—those who favor the aeroplane principle and the advocates of the dirigible balloon. Word was received from Sir Hiram Maxim and M. Santos-Dumont to the effect that they would endeavor to be present. Another special feature of the exposition will be the introduction of manufacturing exhibits showing each and all of the processes in actual operation. A proposal was also made for the exhibition of a model city. This idea, modified, is to be carried out. It will embrace the setting forth, in a practical working way, certain model methods and features of what is considered the best in municipal matters up to the time of the exposition opening. The administration building is to have grouped about it certain service buildings, such as a post-office, hospital, library, etc. It is possible that the idea will be developed so that the curbing, sidewalks, street lamps, street signs, paving, etc., will be treated in a model form. Among the developments of the year regarding the completeness of the exposition was a movement, likely to be successful, for the erection of a religious building, to cost nearly \$500,000. The plan is to have in this structure exhibits of a religious character. In its largest view, according to the opinion of Mr. Schroers, chairman of the committee on education, the fair should include a consideration of the foundations of religious faiths, should "review the triumphs of religion in all ages, set forth the present state of religion among the nations, and its influence over literature, art, commerce, government, and family life." The dedication of buildings has been fixed for April 30, 1903. The President, the cabinet, members of the Senate and the House, the diplomatic corps and all governors have been invited. Representatives of other countries not included in the regular diplomatic list have also received invitations.

LUTHARDT, CHRISTOPH ERNST, a German theologian, died in Leipzig, September 21, 1902. He was born in Maroldswesach, Lower Franconia, March 22, 1823, and after study at the universities of Erlangen and Bonn and service as teacher in the Munich gymnasium, became privat-docent at Erlangen in 1851. Three years later he was made extraordinary professor of theology at Marburg, and in 1856 was appointed professor of systematic theology and New Testament exegesis at Leipzig. In 1887 he became privy church counselor, in 1893 a privy counselor of Saxony, and from 1871 until his death was canon of the Meissen cathedral. He edited the *Allgemeine evangelisch-lutherische kirchenzeitung*, which he founded in 1868, and published *Das Johanneische Evangelium* (1852-53); *Die Lehre vom freien Willen* (1863); *Kompendium der Dogmatik* (1865); *Der Johanneische Ursprung des vierten Evangeliums* (1874); *Systematische Theologie* (1884); *Gesammelte Vorträge* (1876); *Die Kirche in ihrer Bedeutung für das öffentliche Leben* (1882); *Zur Einführung in das akademische Leben und Studium des Theologen* (1892); *Die vier Evangelien* (1899). His *Erinnerungen aus vergangenen Tagen* appeared in 1889.

LUTHERAN CHURCH IN THE UNITED STATES. The first synod, or ministerium, of the Lutheran Church in this country, that of Pennsylvania, was

LIBERAL ARTS BUILDING, Louisiana Purchase Exposition

organized in 1748, and the second, the ministerium of New York, twenty-five years later. Lutherans throughout the world number more than 58,000,000, including in the United States and Canada, 9,000,000 baptized members. The church in America is a polyglot denomination, consisting of English, German, Norwegian, Swedish, Danish, Icelandic, Finnish, Slavonian, Lettish, and French speaking peoples—a diversity of language to which is due the numerous synodical organizations, since in faith the church is united. The four general bodies and fifteen independent synods together embrace 62 district synods with 7090 ministers, 11,678 congregations, and 1,723,819 communicant members; 4478 parochial schools having 3170 teachers and 184,902 pupils; and 6104 Sunday-schools, having 57,246 officers and teachers and 525,467 scholars. The benevolent contributions for 1902, exclusive of congregational and local expenses, aggregated \$1,252,466.

The various divisions are represented as follows: *General Synod*, an English body and the oldest general organization, dating from 1821—24 synods, 1231 ministers, 1578 congregations, and 202,531 members, contributions, \$270,547; *General Council*, established in 1867, composed of English, German, and Swedish adherents—10 synods, 1303 ministers, 2106 congregations, and 361,048 members, contributions, \$290,291; *Synodical Conference*, a German division, founded in 1872—5 synods, 2129 ministers, 2772 congregations, and 599,951 members, contributions, \$335,740; *United Synod, South*, organized in 1886 and embracing an almost exclusively English constituency—8 synods, 215 ministers, 433 congregations, and 41,795 members, contributions, \$22,105; *Independent Synods*, German, Norwegian, Danish, Icelandic, and Finnish in nationality—15 synods, 2212 ministers, 4789 congregations, and 518,494 members, contributions, \$333,783.

The educational and charitable interests of the church comprise 215 institutions, whose property value and endowment amount to \$12,062,933. There are 116 educational institutions, of which 23 are theological seminaries, 50 colleges, 32 academies, and 11 colleges for women, having in all 898 professors and instructors, and 13,765 students, and libraries aggregating 342,610 volumes. The charitable institutions, 99 in number, include 43 orphanages, 18 homes for the aged, 19 hospitals, 11 immigrant and seamen's missions, and 8 deaconess institutions, providing for 23,709 inmates. Many periodicals are issued in English and German, and a considerable number also in Norwegian, Swedish, Danish, Icelandic, Finnish, French, Slavonian, Lettish, and Esthonian. The General Synod conducts a successful mission in India and has numerous missions in the United States; the general council maintains more than 600 missions in its home department, and in the foreign field is represented in Porto Rico and East India.

The nineteenth biennial convention of the Synodical Conference was held in Milwaukee, Wis., beginning on July 23, 1902. Missionary topics occupied a prominent place in the discussions of the conference, a full report being presented on the operations among the Southern negroes. Total receipts from all sources during the last two years were \$36,086. Additional workers are to be placed in the field, and one or more preparatory schools for negroes are to be established. The single English synod under the Synodical Conference requested of the general body co-operation in carrying on its English missions. Foreign missions in East India and Brazil also are supported by the Synodical Conference. Its next meeting (1904) will be in Winona, Minn. The United Synod, South, held its eighth biennial convention, beginning May 7, in Charleston, S. C. In the Japanese mission, several native pastors have been secured who are eminently successful among their own people. The convention recorded its willingness to cooperate with the northern bodies in developing its territory, especially the Gulf region, where many Lutherans are settling. Announcement was made of success in securing \$30,000 for the endowment of the theological seminary at Mt. Pleasant, S. C., thus enabling the institution to employ an additional professor. In 1904 the United Synod, South, will meet in New Market, Va. The General Synod and General Council hold conventions in 1903, in Baltimore and Mansfield, O., respectively. The Maryland general conference of Lutherans in America, April 1-3, 1902, in Philadelphia, was attended by many representatives from the General Synod, General Council, and United Synod, South. It was devoted to discussions on the doctrine, worship, and life of the church.

LUTHER LEAGUE OF AMERICA, a society in the Lutheran Church, organized in 1895, the object of which is the development of greater Christian activity, particularly among the young people. Local organizations exist in many of the States, fourteen having State leagues. Reports have been received by the statistical secretary from 675 local organizations, in 28 States, with a total membership of 34,235; the number of local organizations is, however, nearly twice that noted above, as many have failed to return reports. There are also several district leagues in States not yet organized. The *Luther League Review*, edited by E. F. Eilert, New York City, is published monthly, and the league issues also the *Lutheran Historical*

Calendar. President, William C. Stoevers; assistant general secretary, C. G. Grauer; statistical secretary, Charles K. Hunton, Columbus, O.

McCOLL, Hon. ANGUS JOHN, chief justice of the Supreme Court of British Columbia, died January 16, 1902, at Victoria, B. C. He was born November 8, 1854, at Chatham, Ont., was educated at the Kent Grammar School and Osgoode Hall, and was called to the bar in 1879. In 1882 he began the practice of his profession in Westminster, B. C., and in 1892 was created Q.C. by the Earl of Derby. He was appointed judge of the Supreme Court in 1896.

McCREARY, JAMES BENNETT, formerly governor of Kentucky, and for many years one of the Democratic leaders in Congress, was, in 1902, elected to the United States Senate to succeed William J. Deboe. He was born in Madison County, Ky., July 8, 1838, his father being a member of an old Virginia family, and was educated at Centre College, Danville, Ky., where he graduated in 1857. Later he studied law at Cumberland University, graduating in 1859 at the head of his class, and began the practice of his profession at Richmond, Ky. He served in the Confederate army during the Civil War as major and lieutenant-colonel of a Kentucky cavalry regiment under Morgan and Breckinridge. After the war he resumed his law practice at Richmond, and in 1868 was elected a member of the Kentucky State assembly, serving from 1869 to 1873 and being speaker during the last two years. From 1875 to 1879 he was governor of Kentucky, restored harmony in the Democratic party in the State, and suppressed long-existing lawlessness in the mountain districts. He was elected to Congress in 1884 and continued a member until 1897, taking a prominent part in debates and legislation, and during the speakership of John G. Carlisle, being often called upon to preside over the House in the speaker's absence. In 1891 he was one of the American delegates to the International Monetary Conference at Brussels, Belgium, was a strong "sound-money" man, and retired from active participation in politics when the Bryan wing of the Democratic party obtained control of the organization.

MACE DONIA, a part of European Turkey lying between Bulgaria and the Aegean Sea and comprising the vilayet of Salonika and parts of the vilayets of Kosovo and Monastir. See **TURKEY** and **BULGARIA**.

MACKAY, JOHN WILLIAM, an American capitalist, died in London, July 20, 1902. He was born November 28, 1831, in Dublin, Ireland, and came to New York with his parents in 1840. The story of his rise from poor boy to "Bonanza King" belongs to the romantic traditions of the mining fields. He went West soon after the discovery of gold in California, and proceeded, in 1860, to Nevada, where he persevered through many vicissitudes, until, having formed a partnership with three companions, James C. Flood, William S. O'Brien, and James G. Fair, he acquired, in 1872, a two-fifths interest in some mining property that had been condemned by experts, and when on the very point himself of abandoning the claims, opened up the great bonanza in the Comstock Lode under what is now Virginia City. The discovery caused the fall in silver in the world's market which began in 1875. His good judgment showed itself clearly in the management of his vast property, and the good use to which he put an income amounting to about \$800,000 a month. He helped to found the Bank of Nevada in 1878, became president of the Postal Telegraph Company in 1883, and in the following year established the Commercial Cable Company with James G. Bennett. A sharp fight with the Anglo-American Telegraph Company ensued, which resulted in a permanent reduction of the rate to twenty-five cents a word, and left the laurels with the new company. An attempt on Mackay's life, which caused a two months' sickness, was made by an insane stock speculator in 1893 in San Francisco. He was interested in art and gave a large sum of money for the erection of a statue of Joan of Arc in Nancy, France. He was also liberal to charities, and gave much money, especially to the Roman Catholic Church, of which he was a member.

McMILLAN, JAMES, United States Senator from Michigan, died at Manchester-by-the-Sea, Mass., August 10, 1902. He was born at Hamilton, Ontario, May 12, 1838, and after receiving a grammar-school training in his native city, removed to Detroit in 1855, where he began a business career that early proved successful. In 1864 he took part in organizing the Michigan Car Company, from which afterward sprang the Detroit Iron Furnace Company, the Detroit Car Wheel Company, and the Bangor Steam Forge Company, of all of which he was president. He also successfully organized the Duluth, South Shore and Atlantic Railway and many other corporations. Having become a leader in local affairs his entrance into politics was natural. In 1877 he was elected chairman of the Republican State Central Committee, in which office his masterful power of organization and control of men and affairs raised him to the position of a State leader and made him the logical successor to Senator T. W. Palmer in 1889. Re-elected in 1895 and 1901, each time as the unanimous choice of the Republicans in the legislature, he was a leader in the

Senate, as chairman of the Committee on Manufactures, and member of committees on naval affairs, agriculture, and the District of Columbia, his services on the naval committee being especially notable at the time of the Spanish-American war in 1898. His work in the Senate, in which he was consistently a protectionist and a believer in expansion, was of the "noiseless" variety, being performed in committee rather than on the floor. Among his many benefactions to Detroit may be mentioned the foundation of Grace Hospital, and gifts to the Museum of Art and the Young Men's Christian Association. To the University of Michigan he presented one of the most valuable Shakespeare libraries in the United States.

MADAGASCAR, an island in the Indian Ocean separated from the coast of Portuguese East Africa by the Mozambique Channel, is a French colony. The area of the island which, reckoning Australia as a continent, is the third largest in the world, is, with its adjacent islands about 227,750 square miles. No census of the population has ever been taken, and estimates have varied from 2,500,000 to 7,000,000, but that of the governor-general (1900), which placed the number at 3,500,000, is probably more nearly correct. The Hovas, a tribe allied to the Malays, constitute the most important element in the population, and number something over 1,000,000. There are other native tribes of considerable size, and the coast regions have a mixed population of Chinese, Malays, Hindus, and Mauritian creoles. The capital and largest city is Antananarivo, situated 80 miles inland from the eastern coast, with a population of 100,000. The chief ports are Tamatave on the eastern, and Majunga on the northwestern coast.

The Christian population was estimated in 1895 at 500,000, of whom 450,000 were converts of Protestant missions, but since that time the converts to Catholicism both from Protestant and heathen elements have been very many. The interior tribes are mostly heathen. A graded school system, including agricultural and industrial schools, and superior schools in which instruction is given in medicine and law, has been organized by the colonial government. The appointment in 1896 of General Gallieni, as governor-general, a post which he still holds, marks the actual foundation of the French colonial government, although the French claim to the island dates back to 1642. The greater part of the colony is still under military rule, but civil control is being substituted as rapidly as conditions allow. There is an administrative council at the capital, and civil administrators for nineteen organized provinces or districts. The military forces in the island consist of about 17,000 men, of whom one-half are native.

The colonial revenue, derived principally from direct taxes, customs, and the sale of government lands, amounted, in 1900-01, to 19,400,000 francs, and the expenditure, exclusive of the military expenditure, 17,100,000. The contribution of France amounted in 1902 to 31,340,003 francs, all but 700,000 francs of which was expended for military operations and expenses. The chief products are caoutchouc, raphia, rice, tobacco, hemp, coffee, manioc, tea, and arrowroot. Cattle-breeding and agriculture are the chief occupations of the people, but the agricultural methods are still very primitive. Nevertheless, many plantations founded by the French three years ago, are becoming productive, and the outlook is bright. There are valuable mineral deposits, still little developed. The gold production, derived largely by means of crude placer-mining, amounted in 1901 to £112,840, as against £120,346 in 1900. The commerce, largely with France, is steadily increasing. The imports in 1900 amounted to 39,895,897 francs, an increase from 27,916,614 in 1899. The exports, although still small, increased from 3,605,952 in 1896 to 10,623,810 in 1900.

A railroad 180 miles in length is being built by the government from Antananarivo to Tamatave, but construction is slow, and although in 1902 some 12,000 natives were employed upon it, their work is desultory, and in spite of the exertions of the governor-general, it is not likely to be completed for several years to come.

MADEIRA, a group of islands in the North Atlantic, 338 miles from the African coast, constitutes administratively an integral part of Portugal. The area is 505 square miles and the population, according to the provisional figures of the census of December 1, 1900, 150,528.

MAGNESITE. See MINERAL PRODUCTION.

MAGNETIC SURVEY. The United States Coast and Geodetic Survey formulated a plan in 1902 for the determination of the magnetic elements at more than 400 stations in Virginia, New Jersey, Pennsylvania, Ohio, Michigan, Kansas, Nebraska, Texas, Arkansas, and Florida. The investigations will not be completed before the middle of 1903. Plans were prepared for the erection of a magnetic observatory in Porto Rico and also in the extreme western part of the United States.

MAINE, a New England State, having a gross area of 33,040 square miles. The capital is Augusta. Maine was formerly under the government of Massachusetts, but was admitted to the Union as a separate State on March 15, 1820. The popula-

tion in 1900 was 694,466, while in June, 1902, as estimated by the government actuary, it was 701,000. The largest city is Portland, with a population in 1900 of 50,145.

Finance.—The report of the treasurer of the State of Maine for the calendar year 1902 showed that there was on hand on January 1, 1902, \$297,837.17; the total receipts for the year were \$2,414,385.82 and the expenditures \$2,273,330.31, leaving a balance on December 31, 1902, of \$148,892.68. The principal items of revenue were the State tax, amounting to \$862,348.01; the tax on savings banks, amounting to \$537,720.51; and the tax on railroads, netting \$326,568.11. The total State debt at the end of the year amounted to \$2,785,382.83; of this \$1,983,000 was funded and \$802,382.83 was unfunded. During the year the State debt was reduced by the amount of \$70,000.

Industries.—The three principal crops of the State—hay, potatoes, and oats—were larger than usual in 1902. According to the Department of Agriculture, the crops were: Hay, 1,278,324 acres, yield, 1,367,807 tons, value, \$13,732,782; potatoes, 80,627 acres, yield, 10,481,510 bushels, value, \$6,812,982; oats, 116,461 acres, yield, 4,541,979 bushels, value, \$2,043,891; buckwheat, 25,215 acres, yield, 766,536 bushels, value, \$398,599. Corn was the only other crop of any importance, having a value of \$225,824. The yield of buckwheat per acre was more than 20 per cent. greater than in any other State. Exports of grain at Portland increased considerably. Receipts of grain at that port in 1902 amounted to 12,151,840 bushels, of which 9,172,377 bushels were of Canadian origin.

The horses in the State January 1, 1903, were valued at \$8,830,879; milch cows, \$5,799,324; other cattle, \$2,158,855; sheep, \$1,158,793; and swine, \$726,165. The wool clip in 1902 was reported as 1,559,818 pounds—a small increase over the 1901 clip.

The report of the State Forestry Commissioner showed that in the season of 1901-02 approximately 662,000,000 feet of spruce were cut. The commissioner estimated that the average annual growth of spruce in Maine is 630,000,000 feet.

The principal mineral product of the State is granite. The output in 1901 was greater than in any other State, and was valued at \$2,703,116. A small increase was reported in 1902. Dressed stone rose in value from \$887,786 in 1901, to \$1,501,197 in 1902.

Railroads.—The total mileage of steam railroads in the State at the end of 1902 was 2000.57. The new lines constructed during the year amounted to 81.53 miles. Freight carried in 1902 amounted to 8,868,303 tons. The gross earnings for the year ending June 1, 1902, were: for steam railroads, \$11,763,068.86; for street railways, \$1,573,993.90. There were 342.68 miles of street-car line. The employees on all railways numbered 8479, and their total wages for the year were \$4,458,383.20.

Conventions and Platforms.—The Republican State Convention, held at Portland, on June 11, 1902, indorsed President Roosevelt, expressed faith in the protective tariff and the gold standard, congratulated Cuba on independence, approved of the policy in the Philippines, and advocated liberal pensions for soldiers of the Spanish and Philippine wars. Other policies favored were: Government aid for the merchant marine; strong national and State legislation to protect labor and regulate monopolies; legislation to suppress anarchy and protect the person of the President; the continuance of State laws for the promotion of temperance, and the enactment by the next legislature of a direct primary law. The Republican administrations in State and nation were indorsed, and the action of the State's representatives in Congress were commended.

The Democratic State Convention was held at Bangor on June 17. The platform favored an immediate declaration of the intention of the United States to give to the Filipinos at an early date complete home rule and entire independence; the immediate abolition of all tariffs upon trust-made articles; free trade with the insular territories "which the Republican party is attempting to govern as colonial provinces"; the most stringent enforcement of all existing laws against trusts, railroad pools, and unlawful combinations; and the passage of new laws to supplement existing statutes of this nature. Demands were made for subjecting all legislative measures to the initiative and referendum; for the nomination and election of United States senators by direct vote of the people; for a gradual reduction of all tariffs; for public ownership of public utilities; for the repeal of the conspiracy law against labor; for the enforcement of the child-labor law, and for legislation looking to the shortening of the working day. The Maine prohibitory law was condemned, and the resubmission of the liquor question to the people demanded.

The Prohibition State Convention was held at Bath, on June 4. The platform charged the old parties with fostering the liquor trade and denounced the course of the national administration in permitting the extension of the traffic in the Philippines. It urged all citizens who in the past had "ineffectually petitioned the President" to join the Prohibition party in a practical protest at the polls.

Miscellaneous.—A movement was taken up during 1902 looking toward the conversion of the lake region of Maine into a great forest and game preserve. This region possesses some of the most beautiful scenery in the world, and the preservation of the native forests and the wild game is considered to be a matter of great importance. A fire broke out in Houlton, on May 17, consuming the greater part of the business section, the churches, and 75 residences, and rendering 125 families homeless. The loss was \$400,000, only one-third of which was covered by insurance.

Elections.—At the regular biennial State election, held September 8, 1902, the full Republican State ticket was elected. The vote for governor was Hill (Rep.), 65,839; Gould (Dem.), 38,349. The Democrats were particularly aggressive during the campaign, not with any hope of securing the election of any State officers but with a desire to make a strong showing for the effect it would have in reducing the Republican majorities and in encouraging the Democrats of other States to make a hard fight. The State legislature for 1903 will consist of 30 Republicans and 1 Democrat in the senate, and 128 Republicans and 23 Democrats in the house.

State Officers.—For 1902 and 1903: Governor, John F. Hill, elected for two years, term ending January, 1905; secretary of state, Byron Boyd; treasurer, Oramandal Smith; attorney-general, George M. Seiders; superintendent of education, W. W. Stetson, term three years, beginning January, 1903; commissioner of insurance, S. W. Carr; land agent, E. E. Ring—all Republicans.

Supreme Judicial Court: Chief justice, Andrew P. Wiswell; associate justices, Lucilius A. Emery, William P. Whitehouse, Sewall C. Strout, Albert R. Savage, Frederick A. Powers, Henry C. Peabody, and Albert M. Spear—all Republicans.

For congressional representatives, see UNITED STATES (paragraph Congressional Representatives).

MALAY STATES, FEDERATED. See FEDERATED MALAY STATES.

MALTA, a Mediterranean island 58 miles south of Sicily, constitutes with Gozo, Comino, and several islets, a British crown colony, the total area being 117 square miles, with a resident population of 183,679 in 1901. The island of Malta has an area of 95 square miles, with 158,000 inhabitants. The capital is Valetta, a port of call and naval station, with about 50,000 inhabitants. The governor and commander of the troops in 1902 was Lord Francis Wallace Grenfell (since 1899). The revenue and expenditure in 1900 amounted to £356,758 and £365,943 respectively; in 1901, £385,698 and £394,508 respectively. Actual imports and exports in 1900 were valued at £1,026,829 and £48,508 respectively; in 1901 at £1,299,309 and £81,153 respectively. The goods in transit in 1900 were valued at £6,407,460 for imports and £6,422,765 for exports; in 1901, imports £8,615,945, and exports £8,601,973.

The decision of the imperial government that the use of English should become allowable in the Maltese courts on March 22, 1899, and that after fifteen years court proceedings should be conducted entirely in that language, continued in 1902 the subject of ill-tempered discussion. In January, 1902, Mr. Chamberlain, the colonial secretary, announced that, while the imperial government was determined to adhere to its decision to give Maltese parents the right to choose whether their children be taught English or Italian in addition to Maltese, it decided to withdraw the measure providing for the complete substitution in 1914 of English for Italian as the language of the courts. On February 8 this decision was formally proclaimed in Malta. It will be remembered that objections to the measure had been shown on the part of the colonial legislators by their refusal to enact bills necessary for the welfare of the colony, and so after this decision by the imperial authorities the governor of the colony warned the council that if such obstructionist tactics were continued the government would be compelled to modify the constitution. This announcement was irritating to the elected members of the council, who expressed their indignation by resigning; they were re-elected, however, and later in the year showed a more conciliatory attitude.

It seemed that the agitation against English was led by a small number of legislators who, to make themselves understood by the people, were compelled to speak Maltese. But apparently the people are not averse to the growth of English in the colony. Of Maltese parents, 94.4 per cent. in 1898 elected English for their children, 97.1 per cent. in 1899, and 98.5 per cent. in 1900; owing to the anti-English agitation the percentage then fell to 75, but it subsequently rose to 80. After the government's concession in 1902 the colonial secretary seemed determined to suffer no longer the "childish game" of the elected members. "The Duke of Wellington," said the London *Times*, "thought it as unreasonable to give a constitution to Malta as to give a constitution to a man-of-war. We have given her a constitution, but, if she persists in reducing it to a farce, the question will arise whether, in the interests of the empire as well as in the interests of the Maltese themselves, we should not revoke it."

MAMMALIA. See ZOOLOGICAL LITERATURE.

MANCHURIA, the northeasternmost portion of the Chinese empire, lying north of the Korean peninsula between Mongolia and the Russian maritime provinces of Siberia. According to official estimates the area of Manchuria is 942,000 square kilometres (363,700 square miles), and the population 8,500,000.

The Chinese-Russian Convention.—When, in 1901, Russia was compelled by the Powers to modify her plans for the occupation of Manchuria, Russo-Chinese negotiations were at once resumed on a new basis. The original agreement for Russian "evacuation" had provided for a withdrawal of Russian troops practically at Russia's pleasure, the convention containing the qualification that the country would be turned over to the Chinese authorities as fast "as the state of the country should permit." Since Russia was to be the judge as to the necessity of continuing the occupation, the acceptance of the convention would have resulted in the practical establishment of a Russian military protectorate in Manchuria. A new convention, however, was signed at Peking on April 8, 1902, by M. Paul Lessar, the Russian minister, and Prince Ching, of the Chinese foreign office, according to which Russia acknowledged Manchuria to be an integral part of the Chinese empire and agreed to restore to China absolutely both the administrative and judicial authority in the provinces. Furthermore, Russia agreed to evacuate the territory within eighteen months, instead of three years, as provided in the rejected convention of 1901, and nothing was said about "the state of the country permitting." The evacuation was to be made in three stages, as follows: (1) From the region between the Great Wall and the Liao River, Russia agreed to withdraw within six months from the signing of the convention; (2) from the Liao River, including Mukden and Kirin, within the second six months; and (3) from the Heh-lung-Kiang province within the third six months. Russia also agreed to evacuate Niuchwang as soon as the Powers should restore Tientsin to the Chinese, or in any event within the second six-month period. Pending the complete evacuation, China was given the "right" of determining with Russia what posts in Manchuria should be occupied by Chinese forces, and China agreed that, after the evacuation, the occupation of new posts by her troops would be undertaken only after consultation with the Russian authorities. Russia further undertook to restore the Shan-hai-kwan-Niuchwang Railway, provided that China would agree to guard and control it herself and not allow any other Power to undertake its defense, control, or extension. On October 8, 1902, in fulfillment of the agreement that portion of Manchuria south of the Liao River was "officially" turned over to the Chinese authorities. The London *Times* correspondent writing on October 20, declared, however, that the evacuation, while probably it literally fulfilled Russia's pledges, was actually not an evacuation at all, that the Russian troops had been merely moved to the Russian railway concessions along the line, and that the practical result was that Russia was more immovably installed in the province than before the occupation. The well-known and influential St. Petersburg paper, *Novoe Vremya*, frankly admits that Russia is in Manchuria to stay. Its Manchurian correspondent writes: "It is said that we are leaving Manchuria; but, as a matter of fact, those on the spot have a totally different impression, and it seems as though we had only just begun to settle down there in real earnest, and to take up the work with energy."

Dalny and Port Arthur.—In 1899 the Russians began to plan for the construction of a commercial port on the site of the Chinese town of Talien-wan, which lies on the southern extremity of Manchuria on the Korean Bay side. This place it was proposed to make, instead of Port Arthur, which is 45 miles south, the most important Russian base on the Pacific coast. The changed plans for the extension of the northern railway system will make it the most important Pacific terminus of the Chinese Eastern, the Manchurian and the Trans-Siberian railways. Its vast advantages over such places as Vladivostok lie in the fact that its fine deep harbor is open at all seasons, and that it is really in a latitude considerably south of Peking itself. In the spring of 1902 it was reported that 23,000 coolie laborers were busily engaged on the Russian works, that \$20,000,000 had already been expended, that five large stone docks and two dry-docks had been constructed, that streets were being laid out both for the Chinese and foreign (or Russian) section and that the population of 50,000 was increasing daily. Many Russian and other European mercantile houses have determined to make Dalny, which is to be a free-trade port, the headquarters of their business. The city will be nominally governed by a council elected by the rate-payers. Two of the council must be Russian subjects and not more than two Chinese or Japanese. The original plan of making Port Arthur a strong military and naval base has, however, not been altered by the building up of Dalny, and in July it was reported that fully 30,000 coolie laborers were employed there in the construction of barracks, streets, sewers, and government storehouses.

Railways.—The railroads in Manchuria open for traffic in 1902 were the Manchurian section of the Trans-Siberian line, which runs from Syretensk (Siberia) on

the Amur River southwest, crossing the Manchurian border and continuing thence across Manchuria via Harbin to Vladivostok on the Pacific coast. From Harbin a line (the Chinese Eastern Railway) runs southward to Niuchwang 450 miles distant on the Gulf of Liao-tong and thence southward 150 miles to Dalny and Port Arthur. Niuchwang is connected with China proper by the Chinese Northern Railway (Shan-hai-kwan-Niuchwang line). At the close of the year it was announced in St. Petersburg that a new branch line of the Chinese railway would be constructed from Harbin to Kirin one of the most important trading centres of Manchuria and the junction of the principal trade routes of northern Manchuria, Corea, and the Amur region, with China.

Other Affairs.—On February 1, 1902, Secretary of State Hay addressed a note to both China and Russia admonishing them that the United States government looked with "the greatest concern" on any agreement whereby China should give Russia any trade monopoly in Manchuria, as constituting a breach of treaty rights.

In February the announcement was made that the Chinese and Russian governments were about to reach an agreement which would circumvent the Powers whose protest resulted, in 1901, in the abandonment of the original Chinese-Russian convention regarding Manchuria. This agreement, it was said, was to take the form of a powerful Russo-Chinese Bank, which should have powers so broad as to secure to Russia practically all that the convention was designed to secure. Immediately the United States, England, and Japan, who had been the first to protest against the convention of 1901, entered a protest at Peking against the chartering of a bank with such unusual powers and privileges. France, willing to give her ally a free hand, made no objection, nor did Germany, the inaction of the latter, it was thought, being influenced largely by the hope of obtaining similar rights in Shan-tung province. The protests of the three Powers, however, accomplished their purpose, and in March China informed their representatives at Peking that the Russian application for a bank in Manchuria had been withdrawn.

The plan of the Chinese government for the reorganization of the imperial administration in Manchuria was made public on June 30, 1902. It was drawn in conformity with the previously declared policy of the government to introduce a vice-regal form of administration together with two or three distinct governors. It also provided for the introduction of Chinese officials in addition to the Manchus, who have hitherto had control of the administration in the province.

MANGANESE. See MINERAL PRODUCTION.

MANITOBA, a province of the Dominion of Canada, has an area of 73,956 square miles. The population, according to the census of 1901, was 246,464, as against 152,506 in 1891, an increase of nearly 62 per cent. The capital is Winnipeg, with a population of 42,336 in 1901, as against 16,697 in 1891. The public schools are free and undenominational, and at the close of 1901 numbered 1416, with an enrollment of 63,881. There are also over fifty schools for Indian children. Of higher educational institutions there are one university, four colleges, a normal school, and three collegiate institutes.

Government and Finance.—The province is administered by a lieutenant-governor aided by an executive council. There is one legislative chamber of 40 members elected on manhood suffrage. Manitoba is represented by 4 members in the Dominion Senate and 10 in the House of Commons. The ordinary revenue and expenditure for the calendar year 1901 were \$1,008,653 (\$905,331 in 1900), and \$1,269,594 (\$972,462 in 1900) respectively. The main items of revenue were the Dominion subsidy, \$483,687; fees of the land titles office, \$85,495; and municipal taxes, \$43,900. Of the expenditure the main items were the interest on provincial debentures, \$187,819; grant for public schools, \$113,451; and special aid to municipalities, \$78,552.

Industries, Commerce, etc.—The total area under crops in 1901 was 2,961,409 acres, and the total grain crop was 85,179,858 bushels, of which the chief items were wheat, 50,502.03 bushels; oats, 27,796,588 bushels; and barley, 6,536,155 bushels. Nearly 19,000 farm laborers were imported to help in harvesting the crop. The total dairy products were valued at \$926,314. During 1901 the provincial lands department sold 161,786 acres, as against 52,641 acres in 1900, and 40 acres in 1895. The trade and commerce for the fiscal year 1902 were more than double those of 1901. The exports for the former year were \$4,896,149, as compared with \$1,084,992 for 1901, and the imports were \$8,659,028, as compared with \$5,396,189 in 1901. There were in the province at the end of 1900 46 chartered banks and branches and 37 post-office savings banks, with 2012 depositors, and deposits amounting to \$949,991.

History.—The Manitoba legislature met at Winnipeg on January 9, 1902. The most important business before it was whether the prohibition act, which the Imperial Privy Council had affirmed to be constitutional, would be enforced. The provisions of the act were drastic, and Premier Roblin's government was disinclined to apply them without further consulting the popular vote. It was announced, therefore,

that a referendum would be taken, and that if 60 per cent. of those on the voter's lists voted, and if 60 per cent. of those voting were in favor of the act, it would be brought into force on June 1. The vote was taken on April 2, and the act was defeated by 22,464 to 15,607. This popular decision was regarded as reopening the whole prohibition question and impelling it into a new and acute phase, besides involving the existence of responsible government in the province. Prohibitionists, who had been successful in passing the measure in the legislature, became hostile to the government for its alleged shuffling and evasion in neglecting to enforce a constitutional act, and many of them refrained from voting when the referendum was taken. The political importance of the matter consisted in the tendency to neglect to enforce other subsequent acts by using the referendum as an excuse. A resolution was passed by the legislature in favor of extending the boundaries of the province so as to include a portion of the districts of Assiniboia and Saskatchewan and northward to Hudson's Bay. The motive of this resolution was the fear that the small area of the province as compared with the Northwest Territories would hamper its influence in the near future. During 1902, the colony formed in Manitoba three years previously for the fishermen who had been forced to leave the island of Anticosti, came to an end.

MANGÈUVRES, MILITARY AND NAVAL. The year 1902 was productive of many important discoveries in the military and naval sciences, and witnessed the practical application of such important inventions as wireless telegraphy and submarine vessels. Besides this, there was the increased interest in tactics and strategy that invariably follows the close of a great war, which just as invariably works havoc with former theories and practices, and opens up still wider possibilities for the future. In brief, throughout the world, the military problems worked out in the various manœuvres, have largely been the testing of ideas and conclusions drawn from the Anglo-Boer war of 1899-1902. Below will be found described the more important naval, military, and combined service manœuvres of the world.

Austria-Hungary.—In the manœuvres held in the vicinity of Sasvar on September 12-16, 1902, in which upwards of 80,000 men were engaged, the participating troops were divided into two armies; one of which, the Western army, was supposed to be Prussian and was charged with the task of defeating or evading the Eastern or defending army. The Western army was under the command of the Archduke Franz Ferdinand, with the Archduke Otto, leading the cavalry; the Eastern army was under the Archduke Frederick, with Count Attiens as cavalry leader. The German crown prince witnessed the operations. The manœuvres as a whole, were of purely domestic importance and presented nothing original that was of interest to the world at large. Of more importance were the combined military and naval manœuvres in which the scheme was the attack and defense of Pola, the principal fortified point on the Austrian coast line. The plan of campaign included the use of torpedo boats for harbor and coast defense, and the blockade of a port. The troops cooperating with the navy (which was in three divisions), consisted of 4500 men, 110 horses, and 4 guns, carried by 4 transports belonging to the Austrian Lloyd. Trieste was the port of embarkation, and one registered ton was allowed for each man for a one-day cruise, two for a two or three days' cruise, and for each horse, six or seven tons. Slings were used for horses and guns, the entire embarkation occupying less than three hours. The scheme of debarkation was as follows: It began at 4 A.M. at three points, and in fifteen minutes 450 men and 6 field-pieces were on shore to cover the debarkation of the rest of the troops and stores. The fortifications were then attacked on the land side, the troops being supported by the ships. The result was in favor of the land defenses.

Bulgaria.—The strategic importance of Bulgaria in the Balkan Peninsula together with the important part her troops will have to play, should the long-threatened Eastern question develop into actual hostilities, made the Bulgarian manœuvres of more than ordinary interest. They were held from September 16 to 20, 1902, in the neighborhood of Shipka. The troops were divided into two armies, that of the North, representing the Russians in 1877, and the South army, that of the Turks. The army of the North under Major-General Durandareffski consisted of 20 battalions of infantry, 4 squadrons of cavalry, and 11 batteries of artillery. The Southern army, under Lieutenant-General Nikolajeff, was made up of 36 battalions of infantry, 16 batteries of artillery, and 12 squadrons of cavalry. The manœuvres were very satisfactory and demonstrated the efficiency of the army organization, mobilization, etc., and the very satisfactory training and equipment of the troops employed. The minister of war, Major-General Paprikoff, was in command of the entire force.

France.—The manœuvres of 1902 were not on so big a scale as is sometimes the case, but this did not interfere with the thoroughness of the operations and their importance to the French nation. The more important manœuvres were in the neighborhood of Toulouse, which city was defended by an army from the North

against an army coming from the southwest. General Brugère was in supreme command. Of especial interest were the operations of two armies equal in strength, who fought a battle on specially selected ground to the east of Troyes, between the Seine and the Aube. One army followed the Boer methods, while the other followed the regular French tactics. The troops representing the Boers were heavily engaged on their flanks, gradually enveloped and finally rushed after heavy-fire action. The victory rested with the attacking army, and the umpires decided that the so-called Boer tactics were practically useless. Capt. T. Bentley Mott, Artillery Corps, U. S. A., was present. The naval manœuvres were held during the month of July, and comprised four distinct periods of operation. The first was based upon the study of the strategic conditions of the western basin of the Mediterranean, which was continued in the succeeding period. The Mediterranean squadron represented the French naval forces, which had taken its post on the Algerian coast, the advanced and light squadron being at Mers-el-Kébir, while the northern squadron, representing the enemy, proceeded from Lisbon to the neighborhood of the Balearic Islands. In the opening phase, the operations comprised the observations of the approaches from Gibraltar, strategic scoutings, formations, tactical operations of contact, and the establishment of communication with Mers-el-Kébir by scouts and wireless telegraphy. In the second place, the French squadron, with a speed of 12 knots, was inferior to the enemy, who had a speed of 10 knots, and its object was to preserve contact until reinforcements could arrive from Algiers. Then followed a concentration of the fleet off Algiers, followed by some tactics and exercises in mooring at Bougie, Philippeville, Bizerta, and La Goulette. The third period of operations occupied the first week of August, and was in the nature of tactical and strategical exercises between the coasts of Tunis and France. The final period included a concentration of forces at the Iles d'Hyères, which consisted of combined exercises, evolutions, formations, exercises in coaling, victualing and watering the fleet. Considerable interest was manifested in the above manœuvres owing to the part which submarines played in harbor defense. Victory invariably rested with the submarines to the great satisfaction of the French naval authorities, who have made this branch of naval warfare an important part of national harbor defense.

Germany.—Manœuvres are common all over Germany, and are held annually in every station or garrison where the number of troops stationed will permit. The most important manœuvres, however, and the operations to which the military strategists of the world direct their attention are known as the Kaiser Manœuvres, owing to the fact that the kaiser is invariably present. The real problem to be worked out is rarely made public and is usually a secret of the greater general staff. Observers draw their own conclusions, aided by whatever information the German military authorities choose to give out. Ostensibly, the principal aim in 1902 was to test the organization and mobilization of the army, and discover, under campaign conditions, the value of such recent innovations as wireless telegraphy and the Boer field tactics. The operations, the field of which lay between Frankfort-on-the-Oder and Posen, covering a territory 30 miles wide and 50 miles long, were held from September 9 to 12 inclusive. Apparently, the invading army was approaching from Russia across the Vistula through Schleswig. The Red, or invading army, consisted of 26,000 infantry, 17,000 cavalry, and 4 regiments of field artillery. The Blue, or defending army, was made up of 20,000 infantry with 11,000 cavalry and 5 regiments of field artillery. The manœuvres ended with a spectacular attack on the invaders by the troops under the personal command of the emperor, which resulted in the complete defeat of the enemy. Generals Corbin, Young, and Wood, of the United States army, were present, and represented the United States. They were attached to the Red, or invading army. Considerable surprise was manifested throughout the military services of Europe and America at the apparent disregard of the German authorities of important lessons that the recent Boer war would seem to have taught. The Germans, however, do not concede that the Anglo-Boer war offered any decisive solution as to the principles and conduct of a war in which both combatants represent the highest development of training and equipment. On the other hand, several foreign expert observers of the 1902 manœuvres have recorded their opinion that many of the tactical formations of the Germans would be absolutely impossible under modern battle conditions. The perfection of their organization down to the smallest detail together with the thoroughness of their training and the proficiency of officers and men alike were universally conceded. Orders, reports, and messages of all kinds were transmitted by wireless telegraphy, the system employed being that of Braun, Siemens, and Halske. The wireless telegraphy detachments accompanying the cavalry division enabled the general commanding the forces to keep in constant touch with all his subordinate commanders, so that the army at large was constantly and quickly informed of the movements of the enemy, and the progress made by various bodies of their own troops, whereas had mounted orderlies

been employed for the same work, the information could have been neither so continuous nor so quickly transmitted. Especially valuable service was rendered by the so-called "mobile posts," which were attached to several of the units. Neither invaders nor defenders realized the expectations of such theorizers as M. Bloch. They rarely opened fire at over 1500 yards, and usually at from 1000 to 1200, or one-half the distance at which the Boers are said to have made good practice. German regulations specify 600 yards as the longest range at which it is useful to employ rifle fire. With regard to shelter, it was observed that one-half the men in the infantry division carried entrenching tools, which enabled them in a light and sandy soil to provide, in twenty-seven minutes, a complete shelter trench affording two feet of good cover with ample room for the men to lie down.

The naval manœuvres were held on September 15, 16, and 17, 1902, in the Unter Elbe. The enemy consisted of fifteen large vessels and a division of torpedo boats, to which were opposed six men-of-war, and a number of torpedo boats.

Great Britain.—Owing to the conditions which existed at the close of the Boer-British war, the usual Aldershot manœuvres were not held. The manœuvres of the British navy in the Mediterranean were held from the 15th to the 20th of September, 1902; 20 ships were engaged. They formulated nothing remarkable, and were largely held for the purpose of testing the efficiency and effectiveness of men and material. Wireless telegraphy was a prominent feature of the operations but was found, in its present stage of development, to be of little, if any, practical value for war purposes. Communication between ships of one squadron was completely disordered by the operators of the opposing squadron, who deliberately sent conflicting messages, the result being that the whole system broke down and was abandoned.

Japan.—The Japanese imperial manœuvres, in 1902, were held from November 10 to 13, concluding on the 14th with a general parade at Kunamoto on the island of Kiushiu. The troops were divided into two armies, north and south, the north defending itself at Kunamoto against the army of the south, which forced a landing at Yatsushiro. Major Wood, U. S. A., was present as the United States representative.

Russia.—The problem set for the grand manœuvres of the Russian army at Kursk was the capacity of the national railroads and transports to meet all the requirements of military mobilization and concentration. The embarkation of the Moscow army occurred between the 3d and 9th of September; that of the south army between the 2d and 8th of September. For the former, the Moscow-Kursk and the Smolensk-Orel railroads were used; and for the latter the Kiev-Kursk, Odessa-Kiev, and Kharkov-Kursk roads. From twenty to twenty-eight military trains were run every twenty-four hours on the Moscow road, and from eight to fourteen on the other. Possession was taken of the station at Kursk, and its resources strained to the utmost to meet the requirements of the concentration, 130 trains arriving there in four days. A noteworthy feature in connection with the test was that the regular passenger traffic was not in the least interfered with, a fact which has peculiar significance when it is recalled how inadequate the system was in 1877, at which time it broke down completely. About 90,000 men were engaged in the manœuvres which followed, but which, with the above exception, presented no new features of striking importance.

United States.—The year 1902 was fraught with importance to the army in the United States, marking as it did radical changes in organization, equipment, etc.; but its chief importance undoubtedly rested on the fact that for the first time in its history, manœuvres of great national importance were held. Those held at Fort Riley during the month of September were carried out by the first and second squadrons of the Fourth Cavalry, the first and third squadrons of the Eighth Cavalry, the Sixth, Seventh, Nineteenth, Twentieth, and Twenty-eighth batteries of field artillery, the Sixth, Eighteenth and Twenty-second regiments of infantry, the First and Second infantry (Kansas National Guard), the foot battery of Kansas artillery, the provisional infantry battalion, and a battalion of the Colorado National Guard. One battalion of national guard from Arkansas, and two from Nebraska were expected, but were prevented from participating in the operations, owing to the lack of appropriations for transportation, etc. A number of officers of the national guard from the various States were present as military observers. The regulars and militia were organized into a division of two brigades under the command of Major-Gen. John C. Bates, U. S. A. The first brigade, under the command of Brigadier-Gen. W. A. Kobbé, U. S. A., consisting of the regular infantry; the second, under the command of Brigadier-Gen. J. W. F. Hughes, Kansas National Guard, consisting of two regiments of Kansas troops. The Colorado battalion was brigaded with the regulars. The divisional cavalry, consisting of the first and second squadron Fourth Cavalry and the first and third squadrons Eighth Cavalry, was under the command of Col. C. C. Carr, Fourth Cavalry; and the divisional artillery, consisting of the Sixth, Seventh, Nineteenth, Twentieth, and Twenty-eighth

batteries field artillery, was under the command of Col. George B. Rodney, artillery corps. Altogether the forces assembled numbered about 6000 officers and men. The schedule of exercises was made up of regimental, brigade, and division drills; lectures on military operations, and field engineering; the construction of various shelter trenches, field bridge and pontoon bridge, and a course of eleven practical field problems in tactics. The programme was entirely carried out, except that the tactical problems were reduced from eleven to nine, owing to persistently bad weather. The force of umpires consisted of a chief umpire, with a senior umpire for each of the opposing forces, and ten umpires distributed in the exercises in accordance with the instructions of the chief umpire. The rules and directions covering the exercises were, in the main, those in use at the infantry and cavalry school and the cavalry and light artillery school, modified in some slight degree. Each evening preceding the exercises, the commanders detailed for the opposing forces received their instructions from the chief umpire. Each commander was given the special situation for his command, together with such information regarding the situation as a whole as he might reasonably be supposed to know by reconnaissance and from the course of the campaign in which he was supposed to be engaged. He did not, however, receive any information which would help him in any way or give him an insight into the plan of operations of his opponent. The conditions of actual warfare were maintained, and immediately on the conclusion of the exercises, the officers were assembled, and the report and comments of the chief umpire were read to them, after which there was a general discussion, and the officers who had been engaged in the exercises were given an opportunity for such explanation as they might deem necessary to correct any error in the reports, or to explain any errors of their own. Secretary of War Root referred to the Fort Riley manœuvres in his report as a good example of what can be done in the way of general manœuvres and exercises by regulars and militia to the great advantage of both in preparation for real military service. He stated that both the officers of the guard and the regular army officers received great benefit, and commented on the good understanding and friendly feeling established between the two classes of officers who were present at the manœuvres. Jealousy, superciliousness, and bad feeling between regular and volunteer officers had been, in the past, most prevailing causes of dissension, and he thought the best way to put an end to such a state of affairs was to bring the officers together, as in the Fort Riley operations. He expressed the hope that before another autumn the passage of the militia bill would enable the War Department to facilitate the attendance of greater numbers of the national guard troops for the repetition of these manœuvres on a larger scale.

The combined navy and army manœuvres were held during the month of September, and were designed primarily to test the thoroughness of the coast defences. The problem worked out was as follows: Anticipating the commencement of hostilities, the attacking Red fleet (without torpedo boats) determines to make a sudden dash upon Newport or the eastern entrance of Long Island Sound, and secure a naval base, taking advantage of the absence of a declaration of war to find the Blue land forces somewhat unprepared. The special problem for the coast artillery was to organize the districts of Narragansett and New London, and to be prepared to resist the attack of the fleet. All the forts in the artillery district of Narragansett, including Fort Adams, Fort Greble, Fort Wetherill and Fort Rodman, and of the artillery district of New London, including Fort Wright, Fort Michie, Fort Terry, Fort Mansfield, and the fort on Gardner's Point, were to be mobilized on a war basis, allowing two reliefs of artillerymen. It was assumed that no mines were in place before the period of preparation, August 29 and 30. The fleet attacks were to include one by day and one by night, and, if possible, a bombardment and forcing a passage. Building of defenses of any kind was not allowed, and torpedo boats were excluded from both sides. The Red fleet consisted of the battleships *Kearsarge*, *Alabama*, *Massachusetts*, *Indiana*, and *Puritan* (rated as a battleship for the purpose of the manœuvres), the armored cruiser *Brooklyn*, protected cruisers *Olympia* and *Panther* (the latter also specially rated), the unprotected cruisers *Montgomery*, *Mayflower*, and *Aileen*, the gunboats *Gloucester*, *Scorpion*, and *Peoria*, the tugs *Nina*, and *Leyden*, and the converted merchant steamer *Supply*. Such of the State troops as desired to take part in the manœuvres were assigned a position, and the naval militia distributed among the ships. The engineers laid the mines, installed searchlights, laid cables, telegraphs, telephones, and built the necessary houses for them. The ordnance department furnished ammunition and installed electric firing gear for the mortars and large harbor guns. The Signal Corps installed telephones, telautographs and other communications, laid and maintained the lines for improvised horizontal-system of range-finding, and had general charge of the service of scouting and information beyond the limits of the military reserve; such charge involving a wireless telegraphy station on patrol boats, as well as on shore, balloons, rockets, etc. In the operations the initiative was with the fleet,

and Rear Admiral Higginson in command divided his officers into two squadrons, the first of which was under his own personal command. Hostilities began at midnight, August 31, previous to which the fleet rendezvoused in Menemsha Bight, off Martha's Vineyard. On September 1 the fleet attacked Block Island in the early morning, landed troops, and captured the signal station at Beacon Hill. An incident of this capture, which proved unfortunate for the navy, was the failure of the latter to capture all the signallers of the station. Several escaped and continued to send information by means of small colored balloons, etc. The operations were then carried out to their conclusion according to the instructions. The strategy of the campaign as carried out by the navy was regarded as perfect. The coast defenses received great benefit from the manœuvres in that many important defects were discovered and afterwards remedied. These latter further labored under the disadvantage of having several forts (Michie, Mansfield, Wetherill, and Rodman) manned for the first time. The navy had the great advantage of knowing the exact location, character, weaknesses and strong points of the various forts. Contrary to the experience of the British, Admiral Higginson of the victorious squadron is reported to have regarded the absence of wireless telegraphic service on the ships of the United States navy as a serious drawback. He is quoted as follows: "Its value to me during the four days would have been incalculable. I could have spoken to my ships at sea, day or night, at any moment by wireless telegraphy, whereas, while all were in touch with me, they had been far beyond signalling distance, and, as it were, beyond my reach. While I have seen much during the last four days of value to me and to the navy, this one need of wireless telegraphy stood out so conspicuous in my mind as being the lesson of the last four days, that it is all-absorbing in its importance, to my mind."

The Caribbean manœuvres were held during the month of December, 1902. The search problem began on December 5, and the two commands of Rear-Admirals Higginson and Sumner were pitted against one another. The Bureau of Navigation preserved the same secrecy concerning the manœuvres as characterized it during the Spanish War. The official plan of the search problem was as follows:

"The White fleet to include vessels of commands of Rear-Admirals Sumner and Crowninshield, combined under the former; the Blue fleet to include vessels under Rear-Admiral Higginson.

"In the afternoon of December 5 the Blue fleet learned that one of its scouts sighted the White fleet December 2, in latitude 15 degrees North, longitude 45 degrees West, a position about 900 miles to the eastward of Barbados. This White fleet represents an advanced detachment of an enemy whose object is to secure a base in the Porto Rican waters between and including Mayaguez on the west, and Great Harbor, Culebra, on the east; also to mine the main ship channel of the port seized before 6 P. M., December 10, at which time the problem ends.

"(a) If it enters the port selected and has worked one hour in laying mines before the arrival of a Blue force 50 per cent. greater than its own, it wins. (b) If it enters the port and completes the mining of the channel before the arrival of a Blue force double its own, it wins. The White loses if intercepted by a superior Blue force at sea, or in less than one hour after it enters the port.

"The Blue force to win must: (a) With a superior force meet the White fleet at sea, or within one hour after it has anchored in the port selected. (b) If the White force has been at anchor more than one hour, but not long enough to plant all its mines, the Blue force must be 50 per cent. greater than the White." The Blue force won.

MANUFACTURES. During 1902 in the United States there was a continuation of the activity and prosperity of the previous year, and in the great majority of instances factories were working full time or overtime. There was an active demand for raw materials which, in some cases, notably that of iron and steel, could not be altogether supplied from domestic sources, or at least could not be furnished in sufficient quantities, on account of lack of railway facilities for moving freight. There was for the most part a keen demand for most manufactured articles at home, which caused manufacturers to pay little attention to the export trade. As a result, there was less talk heard in Europe of the "American Invasion," and, as will be seen from the table later in the article, a marked decrease in the exportations of certain lines of manufactures. Among government officials and others who have been working to extend the foreign trade, this was greatly deprecated, but it was said on the other hand that where foreign business had been firmly planted and the articles well known the trade continued active and showed no signs of diminution. It was on new lines, however, that there was a lack of initiative on the part of the Americans which enabled continental manufacturers to enter the field with more confidence.

The manufacture of machinery and other metal goods in its many forms was extremely active during 1902, and served in a measure to reflect the general pros-

perity. The demand was for the most part domestic, and, as we have said, this was due to the fact that manufacturers had as much as they could do to satisfy the home market without reaching out for export business. Generally speaking, wages and raw material were higher, but at the same time prices have been good and business active. Iron and steel are discussed at length elsewhere in this YEAR BOOK (see IRON AND STEEL), but mention may be made of manufactures into which they enter. Railway equipment was in active demand caused by the increase of track, rolling stock and other equipment by the leading railways as a result of several seasons of prosperous business. The dearth of freight cars caused activity among builders of such rolling stock, especially those making steel cars. Locomotive manufacturers also reported heavy business, and the Schenectady works of the American Locomotive Company underwent considerable extension. As a result of the growth in railway activity in the South it was determined to increase the capacity of the locomotive works at Richmond, Va. The Baldwin works at Philadelphia enjoyed a year of active business and turned out 1503 locomotives, of which 99 were for export. This is the greatest number ever constructed by this company in any one year, and improvements and extensions made during the year will increase this output by some 33 1-3 per cent. Electrical machinery was in active demand during the year, and the extension of trolley and other electric railways continues. Another side of the industry has been the demand for electrical machinery, due to the construction of so many large buildings all of which require electrical equipment of considerable extent. This large amount of building also had its effect on numerous other industries, and served in part to explain the volume of business.

In textile manufacturing the activity which characterized 1901 has continued, and many new mills are reported as in course of erection or as having been completed. From reports published in the *American Wool and Cotton Reporter*, statistics have been compiled which show the extent of the construction of new textile mills. The number for the year is given as 455 as compared with 469 in 1901. Of these 272 were in Northern States, and 183 in the South, as compared with 171 and 208, respectively in 1901. This shows that in spite of difficulties in financing schemes for industrial expansion, the progress of past years is being maintained and that the construction of cotton mills in the South (see COTTON) is being vigorously carried on. As regards the classes of goods made, the following division of these new mills may be made:

	1902	1901
Cotton	199	219
Woolen	68	81
Knit goods.....	103	110
Miscellaneous	85	54
Total.....	455	464

The year 1901 was abnormal as regards the number of woolen mills erected, so that there is nothing particularly significant in the decrease. The class termed miscellaneous includes a large number of silk mills, an industry which has flourished during the year. See SILK INDUSTRY.

Exports of manufactured articles were as follows in 1901 and 1902:

	1901	1902		1901	1902
Iron and steel.....	\$102,534,575	\$97,399,036	Musical instruments.....	\$3,598,645	\$3,437,337
Refined mineral oil.....	66,492,385	61,343,980	Gunpowder and other explosives.....	1,965,875	2,393,480
Copper manufactures.....	33,534,899	45,485,598	Paints and colors.....	2,051,036	2,219,438
Cotton goods.....	26,042,755	33,274,907	Glass and glassware.....	2,037,043	2,094,701
Leather and manufactures of.....	28,949,447	30,551,072	Brass and manufactures of.....	2,078,178	1,809,312
Agricultural implements.....	18,714,908	17,981,597	Wool manufactures.....	1,531,777	1,588,068
Chemicals, drugs, etc.....	14,287,110	13,437,367	Marble and stone manufactures.....	1,795,515	1,587,967
Wood manufactures.....	11,038,550	12,437,864	Jewelry.....	1,278,355	1,304,335
Carriages and cars.....	10,861,401	10,081,319	Lamps and chandeliers.....	968,131	956,655
Paraffine.....	7,959,907	8,398,450	Lead and manufactures.....	625,234	696,010
Paper and manufactures of.....	7,324,073	7,251,517	Plated ware.....	601,394	680,471
Scientific instruments.....	6,417,529	6,466,201	Varnish.....	602,083	624,597
Tobacco manufactures.....	5,377,189	5,523,234	Earthen and china ware.....	526,820	604,246
Fibre manufactures.....	4,418,406	5,111,865	Tin manufactures.....	495,435	529,061
Spirits, wines, and liquors.....	4,791,263	4,523,103	Starch.....	1,872,529	516,604
Books, maps, and engravings.....	3,623,069	4,407,028	Bricks.....	541,569	501,434
India rubber manufactures.....	3,326,016	3,816,754			

For descriptions of the year's progress in separate industries, see the articles, COTTON, IRON AND STEEL, RUBBER, SUGAR, SILK INDUSTRY, SHIPBUILDING, WOOL, etc.

MARCHETTI, FILIPPO, an Italian composer, died on January 18, 1902. He was born at Bolognola, February 26, 1835, was a pupil of Conti and Lillo at the Royal Conservatory of Naples in 1850-54, and won decided success with his first opera, *Gentile da Varano*, at its presentation in 1856 at the Teatro Nazionale of Turin. From 1860 to 1863 he was an instructor in vocal method at Rome, and subsequently at Milan, wrote his *Giulietta e Romeo* (with libretto by Marcello), which at La Scala, as well as also in Trieste, was produced with notable approval. This he followed by *Ruy-Blas*, which from its first rendition (at La Scala, 1869), met with a brilliant reception in Italy, but ten years later at Dresden attracted much less attention. From 1881 he was director of the Accademia di Santa Cecilia in Rome. Other operas are, *Gustavo Wasa* (1875), and *Don Giovanni d'Austria* (1880), which, however, are much inferior to his earlier work. In addition to operatic compositions he wrote also choruses, symphonic works, songs, and sacred music.

MARCUS ISLAND, in latitude 24° 14' N. and longitude 153° 4' E., called forth in the summer of 1902 considerable discussion as to its ownership. In 1889 Captain Andrew A. Rosehill, an American, landed on the island, which was unclaimed and without inhabitants, and took possession in the name of the United States. He did not remain in effective possession, however, and did not comply with the law requiring the filing of a claim until 1902. Meanwhile Japanese had taken possession. In 1902 Rosehill purposed to make his claim to possession effective. But the Japanese, through their government, entered protest with the United States government. Rosehill was then on his way to the island, and when he reached there (July 30) he found a note from the United States government, brought thither by a Japanese warship, advising him to avoid a forcible demonstration in support of his claim. Rosehill thereupon went away and the dispute was left for diplomatic settlement. The island is said to be only a mile and a half long and two-thirds of a mile wide. It is of no importance except for guano deposits.

MARIANNE ISLANDS. See under CAROLINE ISLANDS and GUAM.

MARIE HENRIETTE, Queen of the Belgians, died at Spa on September 19, 1902. She was born in 1836, and was the daughter of Archduke Joseph of Austria. In 1853 she was married to Prince Leopold, who succeeded his father, Leopold I., as King of the Belgians in 1865. The union proved unfortunate, and the queen's married life was extremely unhappy. She was not only ill-suited in tastes and temperament to Leopold, but saw her hopes blighted in the death and misfortunes of her children. In 1867 the death in France of her only son, the Duke of Brabant, at the age of ten years, was believed by her to have been secretly instigated by French agents who wished, by that means, to hasten the absorption of Belgium by France. Her daughter, Princess Stephanie, married Archduke Rudolph, crown prince of Austria, and the unhappy married life of this princess soon became notorious throughout Europe, culminating in the tragedy of the archduke's death at Meyerling. A few years ago her nephew, Prince Baldwin of Flanders, died under circumstances which involved a scandal, and her eldest daughter is in an asylum. The queen was a woman of great spirit and resolution, meeting her troubles courageously, and devoting herself assiduously to works of charity. She was of unusual intelligence, was skilled in music and fond of outdoor life. Her daughter Stephanie returned to Belgium at the time of the funeral, but was refused permission to see her mother's body. For an account of this incident, see BELGIUM.

MARQUAND, HENRY, an American capitalist, philanthropist, and art-patron, died in New York City on February 26, 1902. He was born in New York City, April 11, 1819, and after a course of education at Pittsfield, Mass., acquired interests in various enterprises, was connected with railway-construction in the southwest, and was chief promoter of the St. Louis and Iron Mountain Railroad, of which he was first vice-president, and later president until its incorporation with the Missouri Pacific. For ten years he was a banker in New York City, and, long an associate in numerous corporations, held office at his death as trustee of the Mercantile Trust Company, and a director of the Equitable Life Assurance Society. He became best known for his gifts and loans to the Metropolitan Museum of Art, New York City, of which he was for many years president, and whose growth was in important measure due to his wise liberality. The total value of his benefactions to the institution has been estimated at about \$1,500,000. He contributed largely also to public and private charities, and to education. To Princeton University he donated the Marquand Chapel.

MARSH, LUTHER RAWSON, an American lawyer and spiritualist, who died at Middletown, N. Y., on August 15, 1902; was born at Pompey, Onondaga County, N. Y. He studied law privately and in the office of Samuel Beardsley at Utica, N. Y., and after admission to the bar gained a high reputation for professional skill and eloquence. He was retained as counsel by the Erie Railway Company, and was the partner of Daniel Webster from 1844 until the

latter's return to the Senate. In the extension of the park area of New York City, and in the laying out and appraisal of land employed for park use, he was also prominent. He contributed numerous articles to magazines and editorials to the *New York Times*. In 1872 he became interested in spiritualism, originally by way of recreation but later with serious intent. His name was associated with those of Ann O'Delia Diss Debar (who was convicted of conspiracy against him) and the Huylers, mediums with whom he resided at Middletown, N. Y., a gentleman of the old school, reading in his great library, and receiving in séances a "new epistle of St. Paul" and other communications from the spirit world. He published an oration on *General Woodhull and His Monument* (1848), and edited *The Writings and Speeches of Alvan Stewart on Slavery* (1860).

MARTINIQUE, an island in the West Indies lying between the Windward and Leeward groups, is a French colony. Its area is 381 square miles, and its population (1901) 207,011. St. Pierre, population (previous to the disaster) 25,792, was the principal town; and Fort-de-France, population 17,274, is the seat of government. The colonial administration is in the hands of a governor and general council, and the colony is represented in the French parliament by a senator and two deputies. The local budget for 1900 balanced at 5,729,793 francs, and the subvention of France (budget of 1902) amounted to 3,135,516 francs. The debt amounted to 1,555,000 francs. The imports in 1901 were valued at 26,974,000 francs, and the exports, largely sugar, coffee, cacao, tobacco, rum, and cotton, reached a value of 23,827,000 francs. The trade has been almost entirely with France, although, before the eruption of Mont Pelée, that with the United States was growing.

Eruption of Mont Pelée.—The city of St. Pierre and neighboring hamlets were totally destroyed by an eruption of Mont Pelée on May 8, 1902. The outburst was closely related to that of La Soufrière in the island of St. Vincent, but it was much more destructive and some of its features were new to science. There were no outpourings of lava nor serious earthquakes—the usual manifestations of volcanic activity—but a hurricane blast of steam and incandescent ashes swept down the side of Pelée, uprooting, demolishing, and killing everything in its course. Within the space of a few minutes an area measuring 13 square miles was converted into a lifeless desert; only two of the 30,000 inhabitants escaped death in the furious storm which threw every building to the ground and left scarcely a semblance of tree or verdure in its wake. A thin mantle of ashes spread over the ruins and corpses alone indicated the volcanic nature of the catastrophe. This sudden outburst of Mont Pelée gave a new aspect to nature's dynamic processes; its result was one of the most tragic episodes recorded in the annals of history.

St. Pierre and Its Surroundings.—The islands comprising the chain in the Lesser Antilles, which stretches across the opening of the Caribbean Sea in a long loop from Porto Rico to Trinidad, off the coast of Venezuela, are composed mainly of volcanic materials accumulated during successive periods of eruptive activity. True volcanic cones occur at only a few localities, but lava and ash heaps are found almost everywhere beneath the covering of soil; while the presence of soufrières or solfataras shows that the dormant fires in the earth need only an outlet to burst forth with fierce energy. The whole Antillean chain lies along a line of crustal weakness, as is shown by the frequency of earthquakes. Serious volcanic disturbances, however, have been recorded only twice previous to the eruptions of 1902, and both occurred in St. Vincent. In 1812 Morne Garon exploded with fearful force, and nearly 100 years before (1718) there was also an eruption. It is noteworthy that the active periods have followed at nearly equal intervals of time.

Martinique, in the southern section of the Antillean chain, is dominated by two volcanoes, Pelée and Carbet, both lying in the northern part. Mont Pelée is located a little west of the northwest-southeast axis of the island. It is a massive mountain, rudely circular in form, tapering to a summit which has an elevation of some 4000 feet above sea-level. Its crest is bordered by steep cliffs inclosing a bowl-shaped basin or caldera—the summit crater—whose floor, lying 200 feet below the rim, was occupied previous to the eruption by a lake called Lac des Palmistes. The cone of Pelée is not constructional like that of Vesuvius, Etna, Mauna Loa, and other volcanoes erupting molten lava, but has been formed by explosive ejection of ashes, dust, and lapilli gathered from lava that has risen in the conduit and cooled there and from the walls. On all sides except toward the south, the cone falls to the sea, whose depth here is about 5000 feet; southward a long ridge or neck extends from Pelée to the slopes of Carbet. Besides the summit crater, which has a diameter of several hundred feet, the mountain bears sub-craters and one vent that played a prominent rôle in the recent eruption. This vent lies somewhat west of south of the summit crater at a lower elevation. Its position just previous to the outbreak was marked by a small lake, although, as indicated by the local name, Etang Sec, it had generally been dry. The Falaise crater on the east, and the Rivière Blanche crater on the southwest slopes of Pelée, are thought to be secondary centres of

eruption. Near the summit several rivers have their sources, flowing thence in diverging directions through deeply eroded gorges to the sea. The rivers taking a westerly course, including the *Rivières des Peres*, *Rivière Blanche*, and *Rivière Prêcheur*, carried the torrents of fluid mud that poured out of the craters during the period of activity. Almost due south from *Pelée* is the site of *St. Pierre*, occupying a low area sheltered by the mountain walls on the landward side and fronting to the west on the Caribbean. Along the same coast line, a few miles north and south of *St. Pierre*, are the sites of *Prêcheur* and *Carbet*.

Warnings of Eruption.—Since the establishment of the first European settlements in Martinique, the inhabitants had lived without fear of danger from *Mont Pelée*. Yet there was abundant evidence as to the volcanic nature of the mountain; the conical form, the craters, the presence of sulphur in the vent of *La Soufrière*, and the eruptive character of the surface rocks furnished ample proof that in past times outbreaks had occurred. A tradition also had been inherited from the native Caribs that *Pelée* was once active, and in recent times it had given evidence that its fires were still smoldering, ready to break forth at any moment. On May 10, 1851, violent earthquakes shook Martinique, and on August 5 of the same year rumblings were heard from *Pelée*. During the following night ashes fell in *St. Pierre*, *Prêcheur*, and *Carbet*, while the mountain streams for some time carried burdens of volcanic dust. The signs of activity soon ceased, however, and for fifty years the volcano slumbered.

Just when the first movements began which culminated in the eruption of May, 1902, is not definitely known. The view has been expressed that the great earthquake which shook Guatemala on April 18 and which was felt as far away as the Isle of Wight, may have acted as a proximate cause for the outburst. This opinion finds some support in the actual records of the occurrence. There is testimony that on April 23, four days after the earthquake, three heavy reports or detonations were heard in *St. Pierre*, in the direction of *Pelée*; they were accompanied by earth tremors—probably the first preliminaries of activity. On April 25 a great column of smoke rested over the mountain, and light explosions were heard. An observer who ascended the summit saw a dark, boiling mass in the crater, from which jets of steam and water spouted in the air. The further information has been recorded that on April 27 the basin or crater of *Etang Sec* (*La Soufrière*) was in eruption; a cone 30 feet high and 50 feet in diameter at the top had appeared, in the vent of which muddy water and a molten fluid could be seen. Steam and ashes were ejected from the new vent. According to evidence collected by Robert T. Hill, of the United States Geological Survey (*The National Geographic Magazine*, July, 1902), on April 29 rumblings were heard, white smoke rose from the summit, and some of the streams began to rise, burdened with volcanic ashes, débris and dead fish. Ashes fell for the first time in the streets of *St. Pierre*, and from this day there was an increasing shower of dust which became so heavy on May 2 that work was suspended in parts of the city. Another explorer ascended the mountain on May 3, and found that a new vent had been opened in the summit crater and was ejecting hot material into the *Lac des Palmistes*. A violent eruption, during which dense smoke and boiling mud were thrown out, occurred on this day; the *Rivière Blanche* became a raging torrent. At night the streets of *St. Pierre* were lighted by the brilliant flames which played over the volcano's summit. The following day the eruptive phenomena increased in intensity; for a time the sun's light was shut off by a cloud of ashes that fell on the city to the depth of an inch. On May 5 the terrible detonations were combined with lurid flames, lightning, and the fall of dust in such a display that human nerves could not long endure. The people of *St. Pierre* fled panic-stricken into the streets; some wandered aimlessly about, moaning and shouting; others found mental security in the churches. At noon a flood of liquid volcanic material rushed down the bed of the *Rivière Blanche* and completely engulfed the *Guérin* sugar factory, near the river's mouth, destroying 150 workmen. So rapidly came the deluge that it reached the sea in three minutes from its start on the mountain, five miles away. After the rush of the torrent, the sea receded 300 feet from the shore line and returned in a flood that inundated the lower streets of *St. Pierre*. The loud reports of the explosions in *Pelée* were heard in *Guadeloupe* on May 6, when the fall of ashes denuded trees of their foliage and limbs. Many of the inhabitants of *St. Pierre* on this day moved to neighboring hamlets without the limits of the volcano's activity, and a large number was taken on the government steamer to *Fort de France*. No doubt a general exodus would have occurred but for the action of the French governor, M. Moutet, who encouraged the people to remain and sent a detachment of soldiers to prevent the departure of officials stationed in the city. The governor set out for *St. Pierre* to take personal charge in an attempt to restore order, but arrived only in time to perish with the rest. On May 7 telegraphic communication with the outer world was shut off by the breaking of the cables. One of the last messages to come from the doomed city was sent

MONT PELÉE IN ERUPTION

From a stereoscopic photograph. Copyright, 1902, by Underwood & Underwood

by the telegraph operator, and read: "Red hot stones falling here; don't know how long I can hold out." The end came the next day.

The Catastrophe.—The sequence of events on the morning of May 8, when the fearful blast swept away the city of St. Pierre, has been described by several witnesses who were within range of the volcanic forces. Naturally the stories differ in detail, as everybody was too much occupied in seeking refuge to calmly observe what was going on around him. At the time there was a number of vessels riding at anchor in the roadstead, but here the view was obscured by the dense smoke cloud. The record of the essential facts, in which there is general agreement, however, is as follows:

A great cloud of heavy black smoke rolled down the southwestern slopes of Pelée in the direction of St. Pierre. As it advanced with terrific speed along the ground, sheets of flame burst out and the cloud was observed by some to be brilliantly luminous. Along with the vaporous mass, which leveled trees and houses to the ground and left nothing living, came a torrent of red-hot ashes, setting fire to the whole city. The cloud swept rapidly on, but the annihilation was complete. The time of day was eight minutes before 8, as marked by the stopping of the clock at the Hôpital Militaire, or two minutes after 8 according to the record of the cable office at Fort de France.

The area of devastation included approximately the region between diverging lines that extend from the summit of Pelée to near Carbet on the south, and Précheur on the north. Within this area the vegetation was denuded or uprooted, thousands of homes were destroyed, and, according to the most reliable estimates, 30,000 people perished. Eighteen ships in the roadstead, with most of the officers and seamen, shared the general fate. Only two out of all those present in St. Pierre survived the catastrophe, and they were terribly injured by the steam and dust. As to the time consumed in the work of destruction, different opinions have been expressed. According to evidence of eye-witnesses, however, the people must have perished in the space of a few minutes, most of them probably within one minute after the passage of the cloud. Some were overwhelmed while pursuing the ordinary functions of life, showing that they had made no attempt to escape, while others fell in an effort to find refuge from the deadly vapors.

The forces which destroyed St. Pierre moved through the air, and were limited to the cloud-blast and the hot stones and ashes. No serious earthquakes occurred, as is evidenced by the undisturbed condition of houses and bridges within a short distance of the devastated region. The loud aerial detonations were followed naturally by air-blasts that shook the houses, and the explosions within the mountain caused earth tremors of sufficient force to rend the submarine cables entering St. Pierre. The solid ejecta of the volcano consisted of mud, dust, sand, and lapilli. The fact that there were no lava flows is to be ascribed to the refractory nature of the rock, which has the composition of andesite. As soon as the material passed into the upper part of the volcanic conduit away from the source of heat, it hardened and was thrown out in fragmentary form by the explosive energy behind it. The vesicular character of the rock indicates that it contained large quantities of gases or vapors whose explosion caused the loud detonations. No volcanic bombs were ejected such as are characteristic of volcanoes erupting molten lava. During the periods of greatest activity the rock fragments were thrown to a height of many thousand feet. The finer sand and dust were carried to a perpendicular distance of five or six miles and then distributed by the upper air currents over an immense area, while the large particles fell within short range of the volcano. The eruption was followed by brilliant after-glows, which were observed for several weeks in many parts of the United States and Europe.

Causes of Deaths.—The loss of life in St. Pierre was due to various causes. No doubt many succumbed to nervous shock, and many more were killed by the falling of houses, inhaling hot dust, and by fire. The blast of stones, which accompanied the fatal eruption and moved with velocity sufficient to riddle boiler iron, was also an important agency of destruction. But the chief cause of the loss of life was the moving cloud, whose character and composition have been differently interpreted by scientific authorities. The opinions so far expressed in regard to the devastating element in the cloud have been grouped by Prof. I. C. Russell (*The National Geographic Magazine*, December, 1902) in two classes: (1) Those favoring the idea that gases wrought the destruction; (2) those favoring the destructive agency of steam and hot dust.

(1) Several observers advanced the view that gases caused asphyxiation. Such gases might be carbon dioxide, sulphureted hydrogen, or a mixture of the two. There is much evidence that sulphurous odors were spread by the explosions preceding the fatal eruption and that they so strongly impregnated the air at times as to cause the death of animals. One of the craters of Pelée was known to contain sulphur, as is indicated by its name (La Soufrière). Moreover, silverware found

in the ruins was tarnished or blackened as if changed to a sulphide. This hypothesis, which assumes the presence of noxious gases in the cloud, may be supplemented by that of aerial explosions due to the ignition of inflammable gaseous materials. Prof. Angelo Heilprin, one of the first scientists to ascend Mont Pelée after the eruption, has expressed the view that an inflammable gas—probably belonging to the heavier carbon gases—issued from the crater, and was exploded by coming in contact with the air upon release from great pressure, or by lighting. From later observations, however, Professor Heilprin was led to reconsider this opinion (*Mont Pelée and the Tragedy of Martinique*, Philadelphia, 1902). There are some circumstances favoring the explosive theory, such as the flames involved in the cloud and the evidence that the forces acted laterally as well as longitudinally.

(2) There is not any doubt that steam was present in the ejecta of Mont Pelée, and the scientists who have visited the area of devastation in St. Vincent, where the conditions were analogous to those prevailing in Martinique, are almost unanimous in the opinion that a steam blast caused the devastation in that island. Strong support of the application of this hypothesis to Martinique is given in the testimony of the prisoner confined in a subterranean cell, who was one of the two survivors of the catastrophe. This man (a negro), when questioned as to his experience, stated that he smelled no odors of sulphur and had no feeling of suffocation from noxious gases. He heard no noise of explosions, but was burned by the hot vapors and dust that came through the door-grating of his cell. As has been remarked by Professor Russell, the prisoner was in a particularly dangerous position if heavy gases such as carbon dioxide and sulphureted hydrogen were carried in the cloud that swept over the city; for these gases, possessing greater density than air, would seek out just such subterranean chambers. The presence of steam in the blast is also inferred from the character of the burns that had been inflicted upon many of the bodies recovered in the ruins.

Movement of the Cloud.—There are several explanations for the direction taken by the blast of gases or vapors that swept over the city. The cloud no doubt was similar in composition to the vertical smoke columns that rose from the summit during the active periods, and differed from them only in its horizontal movement. This lateral sweep may have been due to the pressure developed at the base of the vertical columns by reason of the weight of the overlying mass and by the fall of rock fragments, both forces acting against the upward blast from the crater. The conditions necessary for the deflection of the blast from a vertical to a horizontal direction are a great height of column and the presence of a large proportion of solid material in the ejecta; both of these conditions apparently were present during the eruption of Mont Pelée. Another view has been advanced, based upon a somewhat different principle. It is believed that steam surcharged with débris behaves (in some ways) like a liquid and of its own weight might flow down a steep gradient and even acquire great velocity. The topographic features of Mont Pelée probably exerted a more or less direct influence upon the direction taken by the blast, as there was a deep cleft or notch in the southwestern portion of the crater's rim. This cleft, known as the *Fente* or *Terre Fendue*, forms the apex of the triangular area that was laid waste by the eruption.

Topographical Changes.—The work of devastation was entirely superficial; except for the covering of ashes and mud—a foot or more in depth—which changed the view of green fields and wooded mountain slopes to a sandy, lifeless, desert landscape, the physical features around St. Pierre are practically unaltered. The reports that the eruption was accompanied by subsidence of the sea bottom in the vicinity of St. Pierre cannot be confirmed, and it is quite certain that there were no such crustal movements. Aside from the minor erosive effects of the wave following the eruption, the shore-line conforms to its original contours.

Subsequent Eruptions.—After the eruption of May 8, the volcano continued to show signs of activity throughout the year, although for periods of several days it was apparently quiescent. A violent explosion occurred on May 20, and on August 30 there was a terrific outburst which destroyed Morne Rouge, Morne Balai, Morne Capot, and Ajoupa-Bouillon, and killed about 2000 people. It was characterized by steam blasts and violent detonations like the previous eruptions. For the eruption of La Soufrière, see ST. VINCENT.

MARYLAND, a Middle Atlantic State of the United States, has an area of 12,210 square miles. The capital is Annapolis. Maryland was one of the original thirteen States. The population in 1900 was 1,190,050, while in June, 1902, as estimated by the government actuary, it was 1,220,000. The populations of the two largest cities in 1900 were: Baltimore, the sixth largest city in the United States, 508,957; and Cumberland, 17,128.

Finance.—The funds in the treasury, September 30, 1901, amounted to \$972,412.91. The total receipts during the year ending September 30, 1902, were \$3,631,259.48, and the total disbursements \$3,416,376.71, leaving in the treasury on September 30, 1902,

ST. PIERRE AFTER THE ERUPTION—Looking North to Mont Pelée
From a stereoscopic photograph Copyright, 1902, by Underwood & Underwood

\$1,187,295.68. Of the receipts \$38,707.83 were derived from the franchise tax on savings bank deposits; \$173,084.46 from insurance companies; \$94,616.54 from incorporated institutions; \$297,466.34 from the tax on the gross receipts of corporations. At the same time there were due from railroad companies \$185,005.69. The funded debt at the end of the fiscal year amounted to \$6,909,326.13; against this amount, however, the State held dividend-paying bonds and stocks aggregating \$4,112,057, thus leaving a net debt of \$2,797,269.13. By an act of 1902 a loan of \$600,000 was authorized for purposes of public buildings. Of this amount, however, only \$400,000 were issued during the year, and by the operation of the sinking fund the net debt was increased by only \$134,924.84. A decision of the United States Supreme Court, held as applicable to the Northern Central Railway a State act of 1890, imposing an annual tax of 1 per cent. on the gross receipts of all railroads operating in the State by steam. The railroad had contended that, as by a prior act of 1880 "to adjust and settle finally by agreement all pending controversies between the State of Maryland and the Northern Central Railway Company," that railroad had been made liable to a tax of one-half of 1 per cent. on its gross receipts, the act of 1890 constituting a violation of contract. The court decided against this contention because the State constitution of 1850 expressly provides that all charters granted by the State may be altered or repealed. On December 11, 1902, the railroad therefore paid the accrued taxes from 1896 to 1902, inclusive, amounting to \$225,017.92.

Agriculture.—Farming interests were fairly prosperous during 1902, the leading crops, as given in the *Crop Reporter*, being as follows: Corn, 628,982 acres, 20,379,017 bushels, value \$10,393,299; winter wheat, 757,090 acres, 11,129,223 bushels, \$8,013,041; oats, 42,132 acres, 1,124,924 bushels, value \$427,471; potatoes, 28,801 acres, 2,304,080 bushels, value \$1,198,122; hay, 298,142 acres, 301,123 tons, value \$4,230,778; tobacco, 34,081 acres, 21,380,625 pounds, value \$1,491,044.

Industries.—The Bureau of Industrial Statistics estimated that in 1901 30,000 people were employed in canning tomatoes, corn, peas, peaches, berries, pears, and pineapples, aggregating \$15,000,000 in value. The men received about \$1.50 per day. They worked at canning about 250 days during the year. In the oyster industry approximately 28,000 people were employed. About \$6,000,000 was invested in the oyster packing industry. The catch in 1901 was estimated at 5,547,793 bushels and valued at \$3,500,000. The bureau reports 16 strikes for 1901, involving 3420 employees. Four were successful and eleven entirely unsuccessful. The cost to the strikers is estimated at \$100,715; the cost to the employers at \$62,050.

Legislation.—Among the important acts passed by the legislature of Maryland during 1902 was one providing punishment for druggists and chemists who incorrectly compound prescriptions. In this law the question of intent is not considered. It was enacted in another measure that all carriers must issue on demand bills of lading to the consignor or order, and such instruments shall be negotiable in the same sense as bills of exchange and promissory notes. Regarding mortgages, a law was passed providing that a mortgagee must swear he has not required the mortgagor to pay any tax on the interest covenanted to be paid, and that he will not require him to pay it. An act was also passed making valid all transactions by women as notaries public, and authorizing the appointment of women as such notaries. By another law provision was made for admission of women to the bar. Laws were passed to make education compulsory. Provision was made for the appointment of three members of the bar to revise the laws relating to corporations, to provide a general system for their formation, defining their duties, powers, and obligations, with details regulating the general method of conducting their operations, remedies for abuse, measure and increase of their powers, also method of dissolving them. Provision is made for the service of legal process on corporations, also for a complete system of incorporation law. The act is understood to include municipal corporations. A tuberculosis commission, with appropriate powers, was created during the session. In addition, a number of statutes were passed relating to sanitation, the protection of public health, and the regulation of the sale of poisons.

In Maryland, as in Louisiana, there was considerable agitation during 1902 regarding the introduction of a bill into the legislature to provide separate railroad accommodation for whites and blacks. A measure was offered by Mr. Campbell, chairman of the house committee on corporations, providing that conductors on railway trains should assign passengers to the seats and that any passenger refusing to accept the seat tendered should be guilty of a misdemeanor and punishable by a fine. This plan avoids the necessity of providing separate cars for negroes.

Elections.—The legislature on January 14, 1902, elected Arthur Pue Gorman (Dem.) United States senator, to succeed George L. Wellington (Rep.). Although chosen as a Republican, Mr. Wellington had become estranged from his party on the question of expansion and imperialism, and had voted with the Democrats. Mr. Gorman was returned to the Senate after an absence of six years.

State Officers.—For 1902 and 1903: Governor, J. W. Smith, elected for four years, term ending January, 1904; secretary of state, Wilfred Bateman; treasurer, Murray Vandiver; comptroller, J. W. Hering; attorney-general, Isidor Raynor; superintendent of education, M. Bates Stevens; commissioner of insurance, Lloyd Wilkinson; commissioner of public lands, E. Stanley Toadvin—all Democrats.

Court of Appeals for 1902 and 1903: Chief judge, James McSherry; associate judges, Henry Page, James A. Pearce, David Fowler, A. Hunter Boyd, I. Thomas Jones, John P. Briscoe, and Samuel D. Schmucker—all Democrats except Schmucker, Republican.

For congressional representatives, see UNITED STATES (paragraph Congressional Representatives).

MASCAGNI, PIETRO, an Italian composer, visited the United States in 1902 with his own orchestra and opera company, in the effort to produce his works where they would obtain the adequate presentation and impartial hearing denied them in Italy through the intrigues of rivals. During his American tour he presented his works at several of the larger cities, but was greatly hampered by mismanagement and by ignorance of American customs. Insufficient preparation forced him to rehearse constantly at the start of his tour, and to the frequent "strikes" of his foreign musicians was added the persecution of the musical unions. He also came into conflict with publishers having the American rights of his music, was several times arrested for alleged breach of contract with his managers, and was so terrified by his accumulating misfortunes that at one time he ventured to travel only attended by a police bodyguard. He was born in Leghorn, December 7, 1863, and though destined by his parents for the legal profession, studied privately until with the aid of an uncle he was enabled to follow openly his strong musical inclinations. A short period of study at the Milan Conservatory, and an unremunerative tour with an opera troupe were followed by several years of extreme poverty, during which he earned his livelihood by teaching the pianoforte and by chance opportunities to act as conductor. His *Cavaleria Rusticana* (1890), which was wonderfully successful when first presented, and which almost immediately gave its composer an international fame, was written for a competition instituted by Sonzogno, a prominent Italian publisher. Mascagni's other works, which include *L'Amico Fritz* (1891), *I Rantzau* (1892), *Guglielmo Ratcliff* (1895), *Silvano* (1895), *Zanetto* (1896), *Iris* (1898), and *Le Maschere* (1900), have met with only moderate success. See MUSIC.

MASHONALAND. See RHODESIA.

MASSACHUSETTS, a New England State, has an area of 8,315 square miles. The capital is Boston. Massachusetts was one of the original thirteen States. The population in 1900 was 2,805,346, while in June, 1902, as estimated by the government actuary, it was 2,925,000. The populations of the five largest cities in 1900 were: Boston, the fifth largest city in the United States, 560,892; Worcester, 118,421; Fall River, 104,863; Lowell, 94,969; Cambridge, 91,886.

Finance.—The balance on hand in the treasury of Massachusetts at the beginning of the calendar year ending December 31, 1902, was \$1,799,205.34. The total revenue receipts during the year were \$20,197,159.87, and the total expenditures \$20,641,195.38, leaving cash on hand, December 31, 1902, amounting to \$1,355,169.83. The total funded debt of the State at the end of the year was \$84,268,735.30. Of this amount the gross direct debt was \$27,413,323.30, against which there was held a sinking fund of \$13,940,695.21, leaving a net direct debt of \$13,472,628.09. At the same time the gross contingent debt was \$56,855,412. The sinking fund held against the contingent debt was \$4,364,034.35, leaving a net contingent debt of \$22,491,377.62. The payment of this contingent debt was guaranteed by a sinking fund created by a direct annual tax on the cities and towns directly benefited by the objects for which the debt was created. The amount of the increase of debt during the year was \$6,572,100 on account of bonds issued for various purposes.

Agriculture and Industries.—The year 1902 was fairly favorable to agricultural interests in Massachusetts. Hay, the most important crop, was far above its average yield, and potatoes were more than usually productive. The leading crops, as given by the *Crop Reporter*, were: Hay, 582,948 acres, 932,717 tons, value \$15,529,738; potatoes, 29,166 acres, 3,177,094 bushels, value \$2,575,066; tobacco, 4755 acres, 7,417,800 pounds, value \$1,112,670; corn, 46,670 acres, 1,460,771 bushels, value \$1,080,971; oats, rye, and buckwheat together were valued at \$172,218.

Statistics for January 1, 1903, showed 181,481 cows, valued at \$7,077,759—more than all the horses, mules, sheep, and swine of the State were worth. There were 93,400 other cattle, valued at \$1,526,566.

Massachusetts quarries produced in 1901 rough granite valued at \$2,216,258. Maine alone exceeded that amount. In 1902 shipments of dressed granite exceeded those of 1901 by \$155,070.

Of twenty-five new cotton mills built in the Northern States in 1902, ten were in Massachusetts, and the number of new looms and spindles set up in Massachusetts

surpassed the number set up in all the other Northern States combined. Of all the States, North and South, only South Carolina constructed a larger number of cotton mills during the year. It is notable that in 1901 only 10 per cent. of the new spindles put into operation were in the Northern States, while in 1902 43 per cent. were in the North. Eight new woolen mills were constructed in Massachusetts in 1902. Wool receipts at Boston in 1901 were 840,483 bales; in 1902, 1,013,738 bales. The greater part of the increase was from domestic shipments.

Railroads.—The total railway mileage in Massachusetts in 1902 was 9,233.25 miles. The gross earnings from operation were \$86,920,565. The operating expenses were \$61,355,821, leaving as net earnings from operation \$25,564,744. The freight hauled amounted to 41,440,170 tons, bringing in an income of \$44,618,645. The passenger business brought in \$34,373,033. The freight rate per ton mile was 1.24 cents. The number of men employed in 1902 was 56,388.

Political.—The referendum as to district local option for the city of Boston was defeated by over ten thousand. The working of the new law for direct nominations for candidates for representatives was successful at the Republican caucus on September 24. The significant section of the law reads as follows: "Every nomination by a political party of a candidate for representative in the General Court, or any elective city office except a member of the school committee of Boston, to be voted for only in two or more wards of one city, shall be made in caucuses by direct plurality vote." Indorsement of the plan was received from many parts of the State, and no complaints were made regarding its operation.

Conventions and Platforms.—The Democratic State convention was held at Boston September 17, 1902. The platform in strong terms demanded the removal of duties on raw materials, particularly coal, iron ore, wool, and hides; urged reciprocity with Cuba and Canada; demanded "the repeal of all tariff duties on articles whose production is controlled by trusts;" and insisted upon independence for the Philippines.

The Republican State convention met at Boston on October 3, 1902. Its platform expressed confidence in the principles of protection as embodied in the Dingley tariff, and attributed to it the present prosperity of the country, but recommended changes in its schedule when justified by business conditions; approved President Roosevelt's plans for Cuban reciprocity; defended trusts as economic institutions, but recommended their regulation by law where they crush out lawful competition, interfere with individual liberty, or seek to corrupt legislation; commended the administration's Philippine policy; and favored the re-election of President Roosevelt in 1904.

The Prohibition State convention was held at Boston September 1, 1902. The platform advocated the merit system for public office, criticised the members of the Democratic and Republican parties in Congress for neglecting to check "the inhuman treatment practiced by our army in the Philippines," also "for consenting to the legalizing and regulation of vice, demoralizing and debauching in effect the army in the Philippines, and elsewhere." It also declared that neither of the great parties cared to use influence in the direction of keeping down the increasing power of the brewing interests, the distilling interests, and those of saloonkeepers. It charged the two great parties with connivance in the "fearful havoc that the liquor traffic is making."

The Socialist platform charged that the capitalist class has a firm grip on the government, using its great power toward its own end, even going so far as to secure the aid of the courts and military in resisting any attempt of working men to ameliorate their condition. Working citizens were urged to unite politically and get control of the government, converting privately owned capital into collectively owned capital, managed by direct legislative methods. The platform declared, also, that, while both parties profess friendship for labor, they are really working hand in hand with capital. The Socialists advocated the initiative and referendum, the public ownership of public utilities, and the election of United States senators by the people.

Labor Movements.—The mill owners of Fall River, on February 26, agreed to advance the wages of the operatives, beginning April 7. The unions voted to ask for 10 per cent. On February 27 the Textile Council voted to ask for the same increase. On March 8 the Manufacturers' Association voted to give a little more than 6 per cent., but on the 15th consented to give the increase demanded, and thus prevented a strike. The freight handlers of the railroad and steamship companies in Boston struck in March. Within a few days, a sympathetic strike of the teamsters took place. The demand of the freight handlers was for a recognition of the union. The teamsters had a grievance in the discharge of seven union teamsters, who declined to participate in the loading of goods handled by non-union freight handlers. Transportation business practically ceased for a week, except for the transaction of express company business, but finally each side yielded certain points and an adjustment was reached.

Primaries and Elections.—At the regular annual election, held November 4, 1902, a full Republican State ticket was elected. The vote for governor was Bates (Rep.), 196,276, and Gaston (Dem.), 159,155, giving the Republican candidate a plurality of 37,120. The chief issue of the campaign was the trusts. Both party platforms demanded regulation of the trusts, though the Democratic platform was the more radical. The Republican candidate was a strong anti-trust man, while the Democratic candidate was known as a defender of trusts. The surprise of the election was the small vote given in Boston to the Democratic candidate, his adherents expecting him to receive a majority of not less than 20,000, but he actually succeeded in getting only about 12,000 plurality over the Republican candidate. The State legislature for 1903 will consist of 30 Republicans and 9 Democrats in the senate, and 146 Republicans, 68 Democrats, 4 Independents, and 3 Socialists in the house.

State Officers.—For 1902: Governor, W. Murray Crane; lieutenant-governor, John L. Bates; secretary of the commonwealth, William M. Olin; treasurer, E. S. Bradford; auditor, Henry E. Turner; attorney-general, Herbert Parker; secretary of the board of education, Frank A. Hill; secretary of the board of agriculture, James W. Stockwell; commissioner of insurance, F. L. Cutting—all Republicans. For 1903: Governor, John L. Bates, elected for one year, term ending January, 1904; lieutenant-governor, Curtis Guild, Jr.; secretary of the commonwealth, W. M. Olin; treasurer, E. S. Bradford; auditor, Henry E. Turner; attorney-general, Herbert Parker; secretary of the board of education, Frank A. Hill; secretary of the board of agriculture, James W. Stockwell; commissioner of insurance, Fred. L. Cutting—all Republicans.

Supreme Judicial Court for 1902 and 1903: Chief justice until November, 1902, when he was appointed associate justice of the United States Supreme Court, Oliver Wendell Holmes; appointed as his successor, Marcus P. Knowlton; associate justices, Marcus P. Knowlton (until November, 1902), Henry K. Braley (after December, 1902), James M. Morton, John Lathrop, James M. Barker, John W. Hammond, and William C. Loring—all Republicans.

For congressional representatives, see UNITED STATES (paragraph Congressional Representatives).

MATABELELAND. See RHODESIA.

MAURER, KONRAD VON, a German archæologist and authority on jurisprudence, died September 18, 1902. He was born April 29, 1823, at Frankenthal, Bavaria, studied at Munich, Leipzig, and Berlin, and in 1847 was appointed professor of jurisprudence at Heidelberg. He made a special study of the Icelandic language and literature, and was one of the foremost authorities on the early history and laws of the Teutonic and Scandinavian peoples. In connection with these subjects, he published: *Die Entstehung des isländischen Staates und seiner Verfassung* (1852), *Die Bekehrung des norwegischen Stammes zum christentum* (2 vols., 1855-6), *Island von seiner ersten Entdeckung bis zum Untergang des Freistaates* (1874), *Zur politischen Geschichte Islands* (1880). He edited *Gull-Thóris-Saga* (1858), and a collection of legends entitled *Isländische Volkssagen den Gegenwart* (1860).

MAURITIUS, an island in the Indian Ocean 500 miles east of Madagascar, is a British crown colony. It has an area of 705 square miles, and a population (1901) of 370,407, the great part of whom are of East Indian birth or descent. The white inhabitants are largely French Creoles. Rodrigues, Diego Garcia, and other small island dependencies have an additional population of about 4000. The capital, Port Louis had a population in 1900 of 53,978. The government, which is more representative than that of the ordinary crown colony, is administered by a governor (Sir Charles Bruce since 1897), assisted by executive and legislative councils, both consisting partly of elected members. There is a thoroughly organized educational system, under the colonial department of instruction, and consisting of primary and grant-in-aid schools, and secondary or superior schools, at the head of which stands the Royal College. The Indian population is largely Hindu or Mohammedan in its religious faith, the European element Roman Catholic. The financial condition of the colony is better than it has ever been, and is improving annually. The latest accessible figures for revenue and expenditure were for 1900, and showed Rs. 9,179,975 and Rs. 8,568,944, respectively. The debt in 1901 was £1,186,684, and there is a local paper money circulation of Rs. 4,636,250. Both imports and exports showed a decrease in 1901 from the values in 1900, the former falling from Rs. 23,052,975 to Rs. 20,400,239, and the latter from Rs. 31,575,276 to Rs. 28,993,067. Nevertheless the trade, which is chiefly with India, Australia and South Africa, is in a prosperous condition. The export of the principal product, unrefined sugar, reached a total value of Rs. 28,836,354. Most of the island being given up to sugar cultivation, the necessities of life have to be very largely imported. There are two railway lines of a total length of 105 miles in operation.

MEDICAL INSPECTION OF SCHOOLS. See EDUCATION IN THE UNITED STATES

MEDICAL PROGRESS in 1902. One of the most interesting achievements during the year was the discovery by Duval and Bassett, of Johns Hopkins University, of the bacillus causative of infants' summer diarrhoea (see BACTERIA). Akin to the study of bacteria is the study of the toxins they create and of the means of neutralization by the administration of antitoxin, or by exciting the production of antitoxin by repeated inoculations with attenuated toxins. Researches in this line have been prosecuted vigorously during 1902. (See ANTITOXIN; CANCROIN; SERUM THERAPY; TUBERCULOSIS.) A few new or newly approved drugs have enriched the materia medica of the clinician. (See ATONYL; ANÆSTHESIN; CEREBRINE; NERVOCIDINE; STYPTICIN.) Further successes are reported from the use of the actinic rays and of the X-rays, as well as from the use of cold as a therapeutic agent. (See FRIGOTHERAPY; PHOTOTHERAPY; RONTGEN RAYS IN MEDICINE.) The crusade against phthisis, which causes a larger proportion of deaths than any other disease excepting infantile disorders, has been continued energetically, but apparently with less satisfactory immediate results. (See TUBERCULOSIS.) An interesting and rather alarming fact has been brought to light in the Philippines, where *surra*, the parasitic disease infesting horses in India, has been discovered. The rôle played by insects in the propagation of disease is still under discussion, and increased testimony is offered in support of large claims. (See INSECTS AND THE PROPAGATION OF DISEASES.) Probably the most popular medical topic of the year was the very enthusiastic reception of Professor Adolf Lorenz, of Vienna, in the United States, and his less welcome visits in London and continental cities. (See LORENZ, ADOLF.) Other medical news and facts will be found under their proper captions.

MENNONITES, a sect of Christians who established their first church in America at Germantown, Pa., in 1683. The denomination includes 12 bodies, the largest of which are the Mennonite with 22,743 members, the Amish with 13,226 members, and the General Conference with 10,395 members. Including the other divisions: Bruderhof, Old Amish, Apostolic, Reformed, Church of God in Christ, Old (Wisler) Bundes Conference, Defenseless, and Brethren of Christ, the denomination as a whole has 673 churches and 1112 ministers with 59,274 communicants. Under the auspices of the church are educational institutions at Elkhart, Ind., having 150 students; at Newton, Kan., with 125 students; and at Bluffton, O., with 50 students. Its periodical literature, in both English and German, is extensive; the *Herald of Truth*, published semi-monthly at Elkhart, Ind., is a representative paper.

MERCURY. The production of mercury in the United States in 1901 was 29,727 flasks of 76.5 pounds, valued at \$1,382,305, as compared with 28,317 flasks, valued at \$1,302,586 in 1900. The exports for the same years were 11,219 flasks (\$475,609) and 10,172 flasks (\$425,812), respectively, practically the entire shipments going to Mexico and Central America. According to an estimate of *The Engineering and Mining Journal* the output in 1902 was 32,000 flasks, of which 4500 flasks came from the Texan mines and the remainder from California. New discoveries were reported in the latter State, resulting in the opening of two mines on a producing scale. The operations in the recently opened district at Terlingua, Tex., were greatly hampered by the lack of transportation facilities and by the adverse conditions of water and fuel; yet the production increased 50 per cent. during the year. The University of Texas issued a comprehensive report (*Bulletin of the University of Texas, No. 15*) upon the geology and present economic conditions of this district, from which it would appear that an increased development may be expected in the near future. There is a large area favorable for the occurrence of cinnabar, and the workings have, so far, been confined to the surface. As the deposits were formed apparently in the same way as those in California, there is reason for supposing that they will prove productive in depth. Among foreign countries, Spain was the only one to report a large increase in production in 1902. The world's output of mercury has fallen off in recent years, and unless some new fields are developed there is a prospect of further diminution in the supplies.

MEREJKOWSKI, DMITRI, the Russian writer whose *Tolstoy as Man and Artist*, published in 1902, provoked much discussion in literary circles because of its unusual assertions in disparagement of Count Tolstoy's character and achievements, was born in 1865 and was educated at the University of St. Petersburg. Since the publication of his first poems in 1886 he has been prominent among the younger set of Russian writers, and is considered by some, though to the greatest extent by his translator, as the one upon whom the "mantle of Tolstoy" is soon to fall. An historical novel at first announced as *The Resurrection of the Gods*, but published in the United States as *The Romance of Leonardo da Vinci, the Fore-runner*, also appeared during the year, the second of a trilogy having as a general

title *Christ and the Anti-Christ*. The first of the series, which will end with *The Anti-Christ*, has already been published as *The Death of the Gods*, dealing with the life and times of Julian the Apostate.

MERIT, ORDER OF, was instituted in June, 1902, by King Edward VII. Membership is conferred on persons who have gained prominence and distinction in their professions and is not conferred for political services. The order has precedence immediately after the Order of the Bath and before the other orders of knighthood. The order has been conferred so far on 12 persons, viz.: Lords Roberts, Wolseley, Kitchener, Rayleigh, Kelvin, and Lister, Admirals Keppel and Seymour, Sir William Higgins, and Messrs. John Morley, Lecky, and G. F. Watts.

MESDAG, HENRY WILLIAM, an artist of the Dutch school, died August 4, 1902, at Amsterdam. He was considered an equal of the Israels in reproducing hazy atmospheric effects, and one of the first marine painters of the world. He was born in 1831 in Gröningen, Netherlands. It was not until late in life that he became an artist, but he gained an almost immediate success, and won medals in Paris in 1870 and 1878. His pictures convey the unusual impression that they were painted from the sea itself rather than from the shore. He was particularly felicitous in depicting the sea in its stormy moods. Some of his best known works are "A Fleet of Fishing Boats at Schveningen," "The Scheldt—Morning," "Sunrise on the Dutch Coast," "Looking for Anchors After Storm—North Sea," and "In Danger." His studio was the largest and most magnificent in Holland.

METEOROLOGY. The results of recent investigations on the temperatures prevailing in the higher regions of the atmosphere were made public at the International Aeronautical Conference held at Berlin in May, 1902. These investigations have been carried on since May, 1900, by means of balloons equipped with self-registering instruments and released simultaneously at Paris, Strassburg, Berlin, Munich, Vienna, St. Petersburg, and Moscow. From the numerous data collected it has been found that the temperature does not decrease steadily upward from the earth's surface, as has been commonly supposed. The observations made at Paris during 258 ascensions show that the decrease becomes very small at an altitude of from 8000 to 9000 metres and ceases entirely at 11,000 metres, while above this altitude a warming may set in. The lowest temperature recorded was -75°C . The range of temperature is as great at 10,000 metres as at 4000 metres, although it has generally been assumed that a nearly constant temperature prevailed at no great distance from the earth.

On January 1, 1902, a new system for the reduction of barometric pressures to the sea level plane was inaugurated by the United States Weather Bureau. This system involves the determination of a standard elevation for each observing station in the United States, West Indies, and Canada, and the calculation of tables for reducing the station pressures to the normal plane. It is proposed to adopt other planes of reference in the near future in the hope of securing more reliable data as to seasonal variations in temperature, changes of climate from year to year, and the radiation effects of the sun upon the earth's atmosphere. An investigation of the phenomena of atmospheric electricity and terrestrial magnetism has been undertaken with the support of the Norwegian government; observations are to be made from August 1, 1902, to June 30, 1903, at four stations located at Bossekop, and in Iceland, Spitzbergen, and Novaya Zemlya. One of the principal objects of the investigation is to obtain data as to the direction, altitude, and intensity of atmospheric electric currents.

METHODIST CHURCH, CONGREGATIONAL. See CONGREGATIONAL METHODIST CHURCH.

METHODIST CHURCH, FREE. See FREE METHODIST CHURCH.

METHODIST CHURCH, PRIMITIVE. See PRIMITIVE METHODIST CHURCH OF AMERICA.

METHODIST EPISCOPAL CHURCH was formally organized, as a denomination of the United States in 1784 when the first general conference met in Baltimore. An annual conference had been held in 1773, seven years after the origin of the earliest regular church. The Methodist Episcopal Church is now the largest Protestant body in the United States, its constituency being exceeded only by that of the Roman Catholic Church. There are 155 organizations in the "plan of Episcopal visitation": conferences 129, two of which were established in 1902, mission conferences 11, and missions 15. The increase in the number of communicants during the past year was nearly 50,000, making the present membership 2,997,772, with 27,875 churches and 17,922 ministers. The value of church property, exclusive of parsonages which represent a total of \$20,519,559, amounts to \$126,085,111. The Sunday schools number 32,669 and have 351,402 officers and

teachers, and 2,758,429 scholars. Contributions for the official benevolences aggregated \$2,679,132, a gain of \$307,501 over last year. The Episcopal board now comprises 21 members, the Rev. William Taylor, D. D. (q.v.), missionary bishop for Africa, having died May 18, 1902. The educational institutions under the auspices of the Methodist Episcopal Church number 164, including 22 theological seminaries with 973 students, and 51 colleges and universities with 29,007 students. They hold property and endowment, in excess of debt, equal to \$35,671,037, and have 3271 professors and teachers, and 50,295 students. The American University, a post graduate institution at Washington, D. C., received numerous gifts during the year. One bequest possibly will realize some \$200,000. On May 14, the corner-stone of the McKinley Memorial Ohio College of Government was laid by President Roosevelt, this being the second of the 23 buildings contemplated, the College of History having been already completed at a cost of \$176,000. Ten million dollars is the sum named for buildings and endowment of the university. The report of the treasurer of the general missionary society shows total receipts for the year 1902 amounting to \$1,462,924. There are missions in the United States, and the foreign fields, in Protestant lands, are Norway, Sweden, Denmark, Finland, Germany, and Switzerland; in Roman Catholic lands, South America, Italy, and Mexico; in Greek church lands, Bulgaria and Russia (St. Petersburg); in non-Christian lands, Africa, China, Japan, Korea, India, and Malaysia. The establishment of a mission in Porto Rico and the organization of the West Central Africa Mission Conference, that for East Central Africa having been formed late in 1901, were among the events of 1902. Particular progress in the Philippines, China, India, and Japan was reported; and the work in Italy was conducted with such activity as to call forth open letters from the Pope.

The creation of a joint missionary publishing house in Shanghai, China, by the Methodist Episcopal Church and the Methodist Episcopal Church, South, was important because of its promise of increased administrative efficiency. It also marked a distinct advance toward affiliation of the two great Methodist bodies. This act was the result of a meeting of the joint commission on federation, held in Baltimore (see below) at which other considerations for missionary cooperation were adopted. Permanent organization of a joint board of directors for the new concern was effected in September. The first general missionary conference in the history of the Methodist Episcopal Church took place in Cleveland, October 21-24. It was called owing to impending financial difficulties, as the missionary activities of the denomination have expanded to such an extent that the ordinary income of the general society no longer suffices to meet the demands made upon it. More than \$300,000 was subscribed by the delegates, who issued an appeal to the church to increase the amount to at least \$500,000 before the meeting of the general missionary committee.

One of the noteworthy events of 1902 was the completion of the twentieth century thank offering, a movement instituted in 1898 in the interests of special objects of the church, for foundation and permanent endowment, and not for current support. Late in the year it was reported that the entire amount of \$20,000,000 had been raised in money and pledges. On March 27 the joint commission on federation between the Methodist Episcopal Church and the Methodist Episcopal Church, South, met in Baltimore. Two committees, on a common hymnal and on a common catechism and order of worship, were provided for and later were appointed by the bishops of the two churches, such action on the part of the Episcopal board of the Southern Church having been authorized at the session of the general conference of that church in Dallas, Tex. The provisions of the commission in regard to missionary activities have been noted above. Formal proclamation of the adoption of the new constitution, which received, in 1901, the necessary three-fourths approved by the annual conferences, was made at the semi-annual meeting of the board of bishops in Chattanooga. At this session also was appointed, in accordance with the resolution of the general conference of 1900, a committee on the consolidation of the benevolent societies of the church.

Higher criticism was, in 1902, the source of controversy in the Methodist Episcopal Church. The views of several well-known professors in Northwestern University were severely criticised, in particular the so-called heresy of Charles W. Pearson, professor of English literature, attracting much attention. Professor Pearson's chief "heresy" consisted in characterizing Biblical infallibility as "superstitious and hurtful tradition," and the miracles of both Old and New Testaments as "mere poetic fancies, incredible and untrue." He issued also an outspoken arraignment of the policy of the church. The case was terminated by Professor Pearson's resignation. *The Carpenter Prophet: A Life of Jesus Christ and a Discussion of His Ideals*, published later, further explains his doctrinal views.

METHODIST EPISCOPAL CHURCH, SOUTH, was organized in 1845, in Louisville, Ky., by annual conferences of the Methodist Episcopal Church in the

South, the separation having been due to the slavery question. The *Year Book* of the denomination for 1902 shows a membership of 1,516,516, an increase in the last church year of 34,721. The Episcopal board is composed of 13 members, two bishops, E. Embree Hoss and A. Coke Smith, having been elected by the general conference of 1902; and the number of ministers and local preachers is, respectively, 6293 and 4982. Nearly 885,000 scholars and 103,486 teachers are enrolled in 14,133 Sunday schools. There are 48 conferences embraced in the "plan of Episcopal visitation." The annual receipts of the general board of missions were \$357,248; the amount raised by the annual conferences for domestic missions, \$170,326. The general body has under its care mission conferences among the Indians and the Germans in Texas, and 8 conferences in the West. Its foreign fields comprise China, Japan, Brazil, Mexico, Corea, and Cuba, where 88 missionaries, 100 native preachers, and 151 local preachers and helpers are employed. The church in these lands is represented by 11,713 members. The publishing house of the denomination, in Nashville, Tenn., has assets over liabilities amounting to \$926,095. Educational institutions number 77, with a student body of 11,983, and property and endowment aggregating \$7,522,583. The board of education conducted, during the last four years, the twentieth century movement to secure \$1,500,000 for educational purposes, and succeeded in obtaining subscriptions in excess of that sum—\$2,040,948, of which \$1,420,512 has been already paid.

The general conference of the Methodist Episcopal Church, South, held its quadrennial session in 1902, May 7-26, in Dallas, Tex. Among its more important acts were plans for the extension of the Epworth League and for greater activity in the development of the missionary conferences in the West; the creation of a board of insurance; the establishment of an order of deaconesses; and provision for a system of correspondence and institute work for the educational improvement of the ministry. The last named institution is maintained in connection with the Biblical department of Vanderbilt University, at Nashville. A motion to remove the time limit on the pastorate, which now is four years, was defeated by a large vote. Serious differences were developed in the discussion over the return of the war claim (\$288,000) which was allowed some years ago by the government in settlement of damages to the publishing house in Nashville during the Civil War. The point at issue was whether this money should be returned, inasmuch as more than a third of the amount had been diverted from the purpose the Senate intended. Resolutions were finally passed repudiating any purpose of deception or unfairness on the part of the church; still the bishops proposed to make a conditional offer of repayment. A large majority of the senators who voted for the measure, however, recently signed a statement exonerating the church and declaring it under no obligation to return the money. The year 1902 was noteworthy for the approach between the two great Methodist bodies, as indicated by the action of the joint commission on federation in establishing a joint missionary publishing house, and in the provision for joint committees on a common hymnal and a common catechism and order of worship. See METHODIST EPISCOPAL CHURCH.

METHODIST PROTESTANT CHURCH was founded in 1830 by seceding members of the Methodist Episcopal Church, after a long controversy on the subject of lay representation. According to the latest statistics available, the denomination has 184,097 members and 1217 probationers, 2401 churches, 534 of which own parsonages, and 1647 ministers and preachers, and 1135 unstationed ministers and preachers. The value of church property is \$4,754,721. In the Sunday schools, numbering 2034, are enrolled 16,680 officers and teachers and 126,031 scholars. There are foreign missions in Japan, including 3 central stations and 22 outlying stations with 22 missionaries and 32 native preachers and workers. A college and a theological seminary and 4 other institutions are maintained in connection with this work. The church issues several periodicals besides the *Methodist Protestant*, the headquarters of the board of publication being in Baltimore, Md. Its educational interests are represented by colleges at Westminster, Md., Adrian, Mich., Tehuacana, Tex., Kansas City, Kan., Wellsville, O., and Yadkin, N. C., with a theological seminary at Westminster. The Methodist Protestant Church was actively identified, during the year 1902, with the movement toward federation that occupied a prominent place in the year's history. At its initiative, a conference with representatives of the Primitive Methodist Church (*q.v.*) was held, resulting in the formulation of a basis of union which will be proposed in the near future to the two churches. The plea for Christian unity addressed to the bishops of the church by members of the United Brethren in Christ (*q.v.*) included the Methodist Protestant Church among those bodies with which union was desirable. It was announced later that a committee had been appointed by the general conference to confer with the United Brethren. The Congregational National Council, some years since, however, pronounced desirable union with the Methodist Protestant Church, and, the matter having been recently agitated anew by local Congregational bodies, the Congrega-

tional committee on comity, federation, and unity requested the president of the Methodist Protestant general conference to select a committee on terms of union. These overtures, though tentative, mark a distinct advance toward denominational union.

MEXICO, a Spanish-American republic extending from the United States to Central America. The capital is the City of Mexico.

Area, Population, etc.—The estimated area is 767,005 square miles. The population, according to the revised figures of the census of October 28, 1900, was 13,604,923. Roman Catholics numbered 12,517,528 and Protestants 42,266.

Government.—The executive authority is vested in a president, who is chosen by electoral vote, and is assisted by a cabinet of seven members. The legislative power devolves upon a congress of two houses, the senate and the house of representatives. The president in 1902 was General Porfirio Díaz, who was inaugurated on December 1, 1900, for his sixth four-year term. The several states elect their own governors and legislatures. In 1900 the regular army numbered 32,143 officers and men. The navy is inconsiderable.

Finance.—The monetary standard is silver and the unit of value the dollar, worth in United States money 46.4 cents on October 1, 1901, and 41.7 cents on October 1, 1902. The fluctuation of silver has caused such uncertainty in values that it was believed in some quarters in 1902 that Mexico would soon change to a gold basis and thus insure a parity of gold and silver coin. The accumulation of a gold reserve would be necessary and this could be brought about only by borrowing; but such a debt, in view of the fact that the development of the country depends largely upon foreign capital, would probably be wisely incurred for the sake of introducing stable conditions.

Revenue accrues chiefly from customs and indirect taxation, and the largest items of expenditure are for the service of the debt and for the army. Revenue and expenditure in Mexican silver dollars have been as follows for fiscal years ending June 30:

	1898	1899	1900	1901
Revenue	52,697,948	60,139,212	64,261,076	63,283,196
Expenditure	51,815,286	53,499,541	58,309,934	59,423,006

The revenue for the fiscal year 1903 was estimated at 64,823,400 dollars; the expenditure approved by the congress was 65,429,881 dollars, as compared with 62,275,102 dollars for 1902. The largest expenditures approved for 1903 were: For the department of finance, 29,320,405 dollars (including 22,216,893 dollars for the public debt); army and navy, 14,299,786 dollars; public works and communications, 9,461,829 dollars; department of the interior, 5,122,734 dollars; public instruction, 2,646,335 dollars. The total public debt June 30, 1901, was 250,716,856 dollars.

Industries, Commerce, etc.—The principal industries are agriculture and mining. The leading crops are corn, henequen (in Yucatan), wheat, and coffee; the chief metals mined are silver and copper. Manufactures are developing slowly. The values of imports, in Mexican gold dollars (98.3 cents), and of exports, in Mexican silver dollars, are reported as follows for fiscal years ending June 30; the figures given for exports of gold and silver are also included in the total exports:

	1898	1899	1900	1901	1902
Total imports	43,603,492	50,869,194	61,304,914	65,083,453	64,656,349
Total exports	128,972,749	138,478,137	150,056,360	148,659,002	156,168,146
Exports of gold	7,405,230	8,914,693	7,441,290	8,955,536	9,315,287
Exports of silver	67,637,102	67,280,964	63,581,734	72,420,784	59,581,869

According to the message of President Díaz, the national railways in September, 1902, were 15,169 kilometres in length, the state railways 1966, and private lines 307,—total, 17,442 kilometres (10,838 miles). In 1902 it was stated that the improvements on the Tehuantepec Railway, which was being relaid throughout its length of 192 miles, would be completed by May, 1903, though the extensive port works at the terminals, Salina Cruz and Coatzacoalcas, would not be finished before 1905. See paragraph Earthquakes.

Pan-American Conference.—The second conference of American republics convened in the City of Mexico, October 22, 1901, and adjourned January 31, 1902. When the sessions began, the animosities existing between some of the republics led many people to believe that the conference would attain no practical results. But such was hardly the case. Nine treaties were negotiated at the conference. All the delegations except those of the United States, Nicaragua, and Paraguay held plenary powers; by these three delegations treaties were signed *ad referendum*. The most difficult problem before the conference was a treaty of international

arbitration. One group of delegates insisted upon obligatory arbitration on all questions not affecting national honor or independence, while another group was equally insistent that compulsory arbitration should not even be considered. The result was that the conference unanimously agreed to accept the principle of voluntary arbitration adopted by the International Peace Conference at The Hague in 1899, and requested the only American governments participant of that convention, the United States and Mexico, to negotiate with the other signatory powers for the adhesion to it of all the other American republics. At the same time the representatives of nine republics—Argentina, Bolivia, Guatemala, Mexico, Paraguay, Peru, Salvador, Santo Domingo, and Uruguay—signed a treaty of compulsory arbitration on questions not affecting national honor or independence. In addition to this convention (1) between nine governments, eight treaties were negotiated by the general conference as follows: (2) A treaty, by which the several republics engaged to arbitrate, under the Hague convention, disputed claims of citizens of one country against the government of another for pecuniary loss; (3) a general extradition treaty; (4) a treaty for international recognition in the learned professions; (5) a treaty providing for a commission to prepare codes of American public and private international law; (6) a treaty concerning international copyrights; (7) a treaty providing for the exchange of government publications; (8) a treaty concerning patents and trade-marks; (9) a treaty concerning the rights of aliens. (The United States delegation did not sign the last two treaties.)

Besides negotiating these conventions, the conference adopted several resolutions, the more important of which were the following: For the holding of an international congress of experts, in New York City, to consider means of facilitating trade and simplifying customs methods; for securing better sanitation in the ports of the several countries; for an international congress to consider the coffee industry (see *COFFEE*); for the reorganization of the Bureau of the American Republics (Washington, D. C.); and for the furthering of the inter-continental railway project. The promoters of this last-mentioned scheme, which under present conditions seems chimerical, propose to connect the railway systems of Mexico and Argentina, using as far as possible existing lines. Such lines, it is needless to note, would not be of great importance in constituting parts of the trunk line. A standing committee on this subject was appointed, including Mr. Henry G. Davis, Mr. Andrew Carnegie, and the Mexican ambassador to the United States, Señor Manuel Aspiroz.

Earthquakes.—On October 23, 1902, earthquake shocks occurred in the Tehuantepec region, accompanied by a tidal wave in the Gulf (of Tehuantepec). According to an official report, damage amounting to more than \$700,000 was suffered by the harbor improvements at Salina Cruz. The tidal wave swept away many buildings at San Isidore, San Diego, Port Angel, and other coast towns. On January 17 there were violent earthquake shocks centring at the capital of the province of Guerrero, Chilpancingo, where, according to reports, several hundred persons were killed or injured. In the latter part of October earthquakes and volcanic eruptions occurred in southern Mexico (states of Chiapas and Tabasco).

MICA. See **MINERAL PRODUCTION.**

MICHIGAN, a central State of the United States, bordering on the Great Lakes, has an area of 97,990 square miles. The capital is Lansing. Michigan was organized as a Territory June 30, 1805, and admitted as a State January 26, 1837. The population in 1900 was 2,420,982; in June, 1902, as estimated by the government actuary, it was 2,490,000. The populations of the largest cities in 1900 were: Detroit, 285,704; Grand Rapids, 87,565; Saginaw, 42,345; and Bay City, 27,628.

Finance.—The report of the treasurer of Michigan for the year ending June 30, 1902, showed that the treasury balance on July 1, 1901, was \$2,627,523.84. The total receipts were \$7,079,429.21, the total disbursements \$6,253,141.91, and the balance on June 30, 1902, \$3,453,811.14. At the same time the trust funds of the State schools, colleges, and universities amounted to \$6,497,036.49, and the bonded debt of the State, consisting of war loan bonds of 1898, was \$416,300. Of the receipts during the year \$2,104,128.63 were derived from specific taxes as follows: From railroads, \$1,430,434.62; from insurance companies of all kinds, \$306,863.04; from telephone companies, \$46,914.01; from express companies, \$30,213.26; from water power companies, \$10,000; from franchise funds, \$55,925.78; and from the inheritance tax, \$211,780.92.

Agriculture and Mining.—The farm crops of Michigan for 1902 were perhaps a little above the average in quantity except corn, which fell about 15 per cent. below the ten-year average. The principal products as given by the *Crop Reporter* were as follows: Corn, 1,333,099 acres, 39,193,814 bushels, value \$18,300,783; winter wheat, 1,056,117 acres, 18,693,218 bushels, \$13,312,245; rye, 155,288 acres, 2,779,655 bushels, \$1,362,031; potatoes, 270,939 acres, 19,507,608 bushels, \$7,998,119; hay, 2,193,567 acres, 3,180,672 tons, \$26,399,578.

During the calendar year 1902 the process of consolidation of the iron ore mines in Michigan, which began several years ago, finally arrived at a point where the greater number of the best mines of the State were consolidated in the hands of the United States Steel Corporation. There was a large increase in the output of Michigan mines in 1902. The production of lake copper in that year was 168,950,000 pounds, an increase over 1901 of about 15 per cent. There was also a large increase in the output of iron ore. In 1902 it was 12,144,018 tons, as against 9,802,584 tons in 1901. There was a remarkable growth of traffic through the canals at the Sault Ste. Marie. The tonnage in 1901 was 28,403,065 tons; in 1902, 35,961,146 tons.

Railroads.—The latest official statistics of railroads of Michigan covering the year 1900 show an increase over 1899 in passenger business of nearly 12.5 per cent. and in freight business more than 4 per cent. The total length of track in the State was 10,639.84 miles in 1900, represented by \$19,164.64 stock and \$22,548.57 bonds per mile. In 1899 the mileage was 10,497.07, with \$15,599.06 stock and \$24,335.17 bonds per mile. The passengers carried numbered 54,088,252, as against 48,195,594 in 1899; and the amount of freight hauled amounted to 122,737,870 tons, as against 117,834,058 tons in 1899. The gross earnings per mile of road were \$7,855.95 in 1900 and \$7,571.49 in 1899. The number of employees in 1900 was 117,606, as against 86,402 in 1899. The marked growth in railroad business and construction, indicated by the official returns, continued throughout 1901 and 1902 with increased activity. The Michigan Central Railroad, on December 27, began suit in the Wayne County Circuit Court against the State for \$6,000,000 for damages resulting from the revocation of the railroad's special charter by the special session of the legislature toward the close of Governor Pingree's administration. In revoking the charter the State gave its consent to be sued.

Conventions and Platforms.—The Republican State convention was held at Detroit on June 26. Regarding the Philippines, the platform said: "We denounce all unwarranted and disgraceful attacks upon the defenders and upholders of our flag in the Philippines, and we pledge faithful support to the government in the efforts to establish good government and personal liberty in those islands." On the tariff and the trusts the platform said: "We continue our abiding faith in the protective tariff, and are opposed to all efforts to destroy it or emasculate it or weaken its beneficent operation;" and "we realize that large combinations of capital may be necessary, but we desire to express our condemnation of all conspiracies and combinations to restrict business, to create monopolies, to limit production or control prices, and we favor such legislation as will effectually restrain and prevent all such abuses."

The convention registered its approval of President Roosevelt's administration and of the record of the Republican delegation to Congress from Michigan; reaffirmed belief in the principles of the national platform of 1900; favored such amendments to the tax laws of the State as will justly and efficiently relieve the owner of real estate from double taxation by reason of taxes on outstanding mortgage thereon, and favored a safe, equitable and effective primary election law by which the nomination of all candidates will be directly controlled by the people. Russell A. Alger was named as the successor to James McMillan, deceased, in the United States Senate, and Judge William M. Carpenter, of Detroit, was nominated for justice of the Supreme Court, to fill the vacancy caused by the death of Justice Charles D. Long. General Alger's supporters won a victory over the friends of Dexter M. Ferry, of Detroit, who favored a resolution to the effect that no expression of sentiment on the candidacy for senator be taken by the convention. The resolution was lost by a vote of 427 to 588. The convention then unanimously indorsed General Alger as the candidate of the party for United States senator.

The Democratic State convention met at Detroit on July 31. State issues absorbed nearly the entire platform. George H. Durand, a gold Democrat, was nominated for the governorship, but proved unacceptable to the Democratic central committee, and declined the nomination. His brother, L. T. Durand, was chosen in his place. The platform declared the supreme issue in the State to be the destruction of boss rule, and, as a means to this end, demanded primaries for the direct nomination of candidates by the people. Other planks called for the election of United States senators by direct vote; the adoption of "the system known as the initiative and referendum, and the imperative mandate"; equal taxation and equal assessments; and municipal ownership of public utilities when so demanded by a referendum vote of the citizens of a municipality.

Elections, etc.—At the regular biennial State election, held on November 4, 1902, the full Republican State ticket was elected. The total vote for governor was: Bliss (Rep.), 211,261; Durand (Dem.), 174,077, giving Bliss a plurality of 37,184. On September 27 Governor Bliss appointed General Russell A. Alger United States

senator to fill the vacancy caused by the death of Senator James McMillan. The State legislature for 1903 will consist of 121 Republicans and 11 Democrats.

State Officers.—For 1902: Governor, Aaron T. Bliss; lieutenant-governor, Orrin W. Robinson; secretary of state, Fred. M. Warner; treasurer, Daniel McCoy; auditor, Perry F. Powers; attorney-general, Horace M. Oren; superintendent of public instruction, Delos Fall; commissioner of the State land office, Edwin A. Wildey; commissioner of insurance, J. Victor Barry (appointed)—all Republicans. For 1903: Governor, Aaron T. Bliss (elected for two years, term ending January, 1905); lieutenant-governor, Alexander Maitland; secretary of state, Fred. M. Warner; treasurer, Daniel McCoy; auditor, Perry F. Powers; attorney-general, Charles A. Blair; superintendent of public instruction, Delos Fall; commissioner of the State land office, Edwin A. Wildey; commissioner of insurance, J. Victor Barry (appointed)—all Republicans.

Supreme Court.—For 1902 and 1903: Chief justice, Frank A. Hooker; associate justices, Joseph B. Moore, William L. Carpenter, Claudius B. Grant, and Robert M. Montgomery—all Republicans.

For Congressional representatives, see UNITED STATES (paragraph Congressional Representatives).

MICHIGAN, UNIVERSITY OF, Ann Arbor, Mich., founded 1837. During the college year ending in June, 1902, there was a slight falling off in attendance in the schools of medicine, law, and dentistry, owing to increased requirements for admission, but a slight increase in the literary department and a large increase in engineering (130). The aggregate attendance, including the summer session, was 3782, as against 3712 the preceding year. Exclusive of the summer session the attendance was 3508, of whom 1400, including 668 women, were students in the literary department, 489 in engineering, 513 in medicine and surgery, 854 in law, 68 in pharmacy, 60 in the Homœopathic Medical College, and 203 in dental surgery. The graduates numbered 823. Of the students 2156 were from Michigan, and 10 foreign countries were represented, and every State and Territory except Delaware, Louisiana, and Alaska. The total attendance of women was 725. A noteworthy feature of the university's co-educational system is the change in the attitude of women toward the courses of instruction, indicated by the fact that in the earlier days of co-education 65 per cent. of the women graduates were from the professional schools, while at the present time about 87 per cent. select the literary courses. The libraries show a gain of 9539 volumes over 1901, making a total of 165,000 volumes. The recorded circulation of books, estimated at half the actual use, was 167,949. The periodicals regularly received numbered 1000. During the year the two hospitals of the university treated 4164 patients. The result of increased power of election in the literary department showed a falling off in Greek of 45 per cent.; in Latin of 33 per cent., and in mathematics of 55 per cent., with large gains in German and history. The six-year law and medical courses, in which a student may earn both the B. A. and B. L., or the B. A. and M. D. degrees, have grown in popularity. The engineering department has developed rapidly. A course in marine engineering has been added with the degree of B. S., and the construction of a new engineering building has been undertaken. To the four years' course in engineering a requirement has been added calling for six weeks' additional work in the summer at the end of the third year. The completion of a spacious building for medical laboratories has added greatly to the facilities for instruction. The law faculty have established a journal, the proceeds of which are to be appropriated to the increase of the law library. The university has taken steps to stop the fraudulent use of its medical diplomas and has secured the conviction of one offender. The Barbour gymnasium has been completed, and a desirable plot of land adjacent to the campus has been purchased. Among the gifts of 1902 are a large tract of valuable timber land in Humboldt County, Cal., given by Mrs. Margaret E. Hunt for the endowment of scholarships in the literary department; two new fellowships in bacteriology from the Rockefeller Research Fund; and an addition of 17 acres to the campus, given by Hon. D. M. Ferry. The president's report calls attention to the need of additional buildings and the endowment of graduate fellowships. The treasurer reports total receipts for the year of \$741,000, with expenditures of \$690,063.

MILITARY ACADEMY, UNITED STATES, West Point, N. Y., opened 1802. The cadets in 1902 numbered 464 and the faculty 71. The library had 45,000 volumes. The chief change during the year was the new regulation permitting entrance to the academy without the mental examination to candidates who can produce a certificate of graduation from a public high school or State normal school, or who are regular students of an incorporated college or university with conditions as to any of the subjects required by the West Point examination. The new rule was put into effect for the first time in the summer of 1902, and the semi-annual examination in December showed that it was working well. The centennial anniversary of the founding of the academy was celebrated with appropriate ceremonies June 9-11.

PRESIDENT ROOSEVELT at the West Point Centennial

1902, and aroused universal interest among graduates, who spared no efforts to make it successful. The exercises included addresses by President Roosevelt, Secretary of War Root, and others, the unveiling of a commemorative tablet, a banquet, and a baseball game between the academy and Yale. A feature of the celebration not on the programme, was the bestowal by the President of a medal of honor on Cadet Calvin P. Titus, of the fourth class, for "gallantry at Peking, China, August 14, 1900, while a soldier of the Fourteenth United States Infantry." This is the first medal of honor given to an undergraduate of the academy.

MILITARY MANŒUVRES. See MANŒUVRES, MILITARY AND NAVAL.

MILLER, ALFRED BRASHEAR, an American educator, died at Waynesburg, Pa., January 30, 1902. He was born in Brownsville, Pa., October 16, 1829, and in 1853 graduated from Waynesburg College in the first class ever sent out from that institution. He was professor of mathematics there from 1853 to 1858 and acted as president from 1858 to 1899, when he was retired as president emeritus. For ten years he held a pastorate in Waynesburg as a clergyman of the Cumberland Presbyterian Church, and was well known as a lecturer before teachers' institutes, Chautauqua conventions, and summer schools. Besides contributing extensively to newspapers and magazines upon religious and educational topics he was the author of *Doctrines and Genius of the Cumberland Presbyterian Church*.

MINERALOGY. Interesting experiments in the production of diamonds by laboratory methods were carried out during 1902 by Professor Goldschmidt, of Vienna. A rock similar in composition to the matrix of the South African diamonds was used for fusing and crystallizing the carbon, apparently with better success than has been obtained with iron. The diamonds were of microscopic size, averaging only 0.05 millimetre in diameter, but they were transparent and showed perfect octahedral form. The following is a list of the new minerals described in 1902: *Melanochalcite*, a compound of the hydroxide and peroxide of copper; *baumhauerite*, a sulpharsenite of lead; *coolgardite*, a telluride of gold, silver, and lead; *anapite*, an iron-calcium phosphate; *koenenite*, an oxychloride of aluminum and magnesium; *chalmersite*, a sulphide of iron and copper; *plumbojarosite* and *natrojarosite*, hydrated sulphates of iron with lead and sodium; and *neotautailite*.

MINERAL PRODUCTION OF THE UNITED STATES. The accompanying table of the mineral and metal production of the United States in 1900 and 1901 is abstracted from the annual statistical reports of the Division of Mining and Mineral Resources of the United States Geological Survey. For the second time in the country's history the value of the mineral output exceeded \$1,000,000,000, having reached a grand total in 1901 of \$1,086,529,521, which represents a gain of 2.15 per cent. over the total for 1900. The output in 1902, according to reliable estimates, showed a marked increase in all the important substances except anthracite coal, the production of which fell off considerably owing to the strike of the Pennsylvania miners. For detailed statistics and information as to mining developments during 1901 and 1902, see **ANTIMONY**; **ARSENIC**; **COAL**; **COKE**; **COPPER**; **GEMS**; **GOLD**; **LEAD**; **MERCURY**; **NATURAL GAS**; **PETROLEUM**; **SILVER**; **TIN**; and **ZINC**.

1. Including brown coal and lignite, and anthracite mined elsewhere than in Pennsylvania.
m. Of 42 gallons.
n. Of 300 pounds for natural cement, and 400 pounds for artificial Portland cement.
o. Not including limestone for iron flux, or stone for grindstones.
p. Of 280 pounds net.
q. Including metallic paint, ocher, umber, Venetian red, sienna, ground soapstone, ground slate, and mineral black.
r. Crystalline graphite, pounds.
s. Amorphous graphite, short tons.
t. Including building sand, glass-sand, iron ore used as flux in lead smelting, tin ore, nitrate of soda, carbonate of soda, sulphate of soda, and alum clays used by paper manufacturers.

MINNEAPOLIS. See MUNICIPAL GOVERNMENT (paragraph Minneapolis).

MINNESOTA, a northwestern State of the United States, has an area of 83,365 square miles. The capital is St. Paul. Minnesota was organized as a Territory March 3, 1849, and was admitted as a State May 11, 1858. Population in 1900 was 1,751,394; in June, 1902, as estimated by the government actuary, it was 1,844,000. The populations of the three largest cities in 1900 were: Minneapolis, 202,718; St. Paul, 163,065; and Duluth, 52,969.

Agriculture and Mining.—The chief crops of Minnesota showed a falling off in yield per acre for 1902, compared with the average for the previous ten years, but owing to an increased area under cultivation the total yield of nearly all crops was considerably increased. The reports as given in the *Crop Reporter* for the year 1902 were as follows: Corn, 1,483,621 acres, 53,826,559 bushels, value \$13,530,624; spring wheat, 5,737,583 acres, 79,752,404 bushels, \$48,648,966; oats, 2,109,223 acres, 82,259,697 bushels, \$22,210,118; barley, 907,561 acres, 23,956,245 bushels, \$9,603,811; potatoes, 137,270 acres, 13,452,460 bushels, \$4,170,263; hay, 841,716 acres, 1,481,420 tons, \$7,940,411; flaxseed, 667,500 acres, 6,942,000 bushels, \$7,427,940. The enormous demands of the iron and steel market caused rapid development of Minnesota's iron mines in 1902. The Vermilion Range produced 2,084,263 gross tons, against 1,786,063 tons in 1901. The Mesabi mines, the newest iron mines in the Lake region, were also by far the most productive and experienced the greatest development in 1902. The output in 1901 was 9,004,890; in 1902, 13,342,840 gross tons. These two ranges yielded about 40 per cent. of the total iron production.

Railroads.—The latest available report of the commissioners of railroads, covering the fiscal year ending June 30, 1901, gives the length of main lines as 6993.63 miles; the gross earnings \$42,459,262, a decrease of \$2,490,831 over 1900; the operating expenses \$25,703,735, a decrease of \$274,483 over 1900. The total number employed on the entire lines entering Minnesota were 155,770, drawing wages amounting to \$89,727,795.

Legislation.—An extra session of the State legislature convened on February 4, 1902, to take action upon the report of the tax commission created by the legislative act of February 26, 1901. The commission, consisting by appointment of the governor, Hon. W. J. Hahn, Hon. H. W. Childs, and Hon. G. S. Ives, had been instructed to devise a complete system for the taxation of all kinds of property, tangible and intangible, and to report to the governor before February, 1902. In transmitting the commission's report the governor strongly urged that it be enacted into law, stating that it appeared to be as adequate a system as could be devised under the existing limitations of the constitution. The governor recommended also that a permanent tax commission be created. The legislature, however, did not fully accept the commission's findings. It enacted, nevertheless, a real estate tax code, levied a tax of $\frac{1}{2}$ to 10 per cent., depending upon the degree of relationship, upon all sums devised by will in excess of \$10,000, and it proposed a constitutional amendment to be voted on in November, 1902, to enlarge the taxing powers of the legislature. The amendment authorized the legislature to levy a tax on franchises in addition to a tax on real and personal property, or to levy a tax upon gross earnings in lieu of a tax on franchises, or on franchises and real property. There might also be levied under the amendment a registry tax on real estate mortgages and an income tax upon evidences of indebtedness, annuities and personal income.

With a view to obtaining more accurate data for the purpose of taxing the railways upon the basis of gross earnings, the public examiner authorized by the laws of 1878 to examine banks and other moneyed corporations was also required to examine yearly into the finances of railways created under the laws of Minnesota or operating therein. With the same general purpose of having more governmental control of railroads, Congress was memorialized to pass the bill introduced February 5 in the Senate by Knute Nelson, investing the Interstate Commerce Commission with power to prescribe railroad rates instead of as at present being merely permitted to declare existing rates unreasonable.

Northern Securities Case.—In accordance with the recommendation of the governor, the legislature appropriated \$25,000 for the prosecution in the federal courts or if that should fail in the State courts, of the case against the Northern Securities Company. In stating his belief that the Northern Securities Company was expressly organized among other things for the purpose of evading and violating the laws of Minnesota by consolidating the properties of the Great Northern and Northern Pacific companies, which owned parallel and competing lines, the governor pointed out the two express sections of the general statutes of Minnesota violated and the sections of the charter of the Northern Securities Company authorizing as it were a violation of the State statutes. The sections of the Minnesota statutes referred to are as follows:

Section 2716.—No railroad corporation shall consolidate with, lease or purchase, or in any way become owner of or control any other railroad corporation, or any stock, franchises, rights or property thereof, which owns or controls a parallel or competing line.

Section 2717.—No railroad corporation, or the lessees, purchasers or managers of any railroad corporation, shall consolidate the stock, property or franchises of such corporation with, or lease or purchase the works or franchises of, or in any way control any other railroad corporation owning or having under its control

a parallel or competing line; nor shall any officer of such railroad corporation act as an officer of any other railroad corporation owning or having the control of a parallel or competing line.

Sections 3 and 4 of the charter of the Northern Securities Company authorize the corporation

"To purchase, hold, sell, assign, transfer, mortgage, pledge or otherwise dispose of shares of the stock of any other corporation or corporations, association or associations of the State of New Jersey, or any other State, Territory or country, and while owner of such stock to exercise all the rights, powers, and privileges of ownership, including the right to vote thereon. To aid in any manner any corporation or association of which any bonds or other securities or evidences of indebtedness or stock are held by the corporation; and to do any acts or things designed to protect, preserve, improve or enhance the value of any such bonds or other securities or evidences of indebtedness or stock."

Conventions and Platforms.—The Democratic State convention, held at Minneapolis June 25, 1902, referred in terms of high praise to William J. Bryan; condemned the policy of the government in regard to Cuba and reciprocity; denounced the power of the modern trusts, and favored the revocation of tariff benefits which they enjoy, and the passage of legislation for their control; advocated the income tax, the popular election of United States senators, municipal ownership of public service corporations, direct legislation and home rule in local taxation, the observation of a general eight-hour work day, the enforcement of the State's law forbidding merger of competing railroads; opposed "government by injunction," and denounced the ship subsidy bill. The Republican State convention, held at St. Paul on July 1, 1902, indorsed the policy of President Roosevelt; declared the adherence of the party to the policy of protection, but favored such modifications as might be required by changing conditions; to remove any burden from the people and to promote foreign trade.

Elections.—At the regular biennial State election, held November 4, 1902, the full Republican State ticket was elected. The vote for governor was Van Sant (Rep.), 155,861; Rosing (Dem.), 99,375, giving the Republican candidate a plurality of 56,486. The State legislature for 1903 will consist of 43 Republicans, 12 Democrats, 1 Populist, 6 Fusionists, and 1 Independent Republican in the senate, and 96 Republicans and 23 Democrats in the house.

State Officers.—For 1902: Governor, Samuel R. Van Sant; lieutenant-governor, Lyndon A. Smith; secretary of state, Peter E. Hanson; auditor, Robert C. Dunn; treasurer, Julius H. Block; attorney-general, W. B. Douglas; railroad and warehouse commissioners, Ira B. Mills, Charles F. Staples, Joseph Miller—all Republicans. For 1903: Governor, Samuel R. Van Sant, elected for two years, term ending January, 1905; lieutenant-governor, R. W. Jones; secretary of state, P. E. Hanson; auditor, S. G. Iverson; treasurer, J. H. Block; attorney-general, W. B. Douglas; railroad and warehouse commissioners, Ira B. Mills, Charles F. Staples, Joseph Miller—all Republicans.

Supreme Court: For 1902 and 1903: Chief justice, Charles M. Start; associate justices, Loren W. Collins, Calvin L. Brown, John A. Losely, and Charles L. Lewis.

For Congressional representatives, see UNITED STATES (paragraph Congressional Representatives).

MINNESOTA, UNIVERSITY OF, Minneapolis, Minn., founded 1851. In 1901-02 the attendance, excluding duplicates, was 3656 (of whom 1042 were women) distributed as follows: Graduate students, 176; college, 1179; engineering and mechanic arts, 345; school of mines, 109; agriculture, 619; law, 504; medicine, 551; summer school, 237. The gain in attendance over the preceding year was 243, and indications pointed to a still greater increase in 1903. There were 110,000 volumes in the library. The university's income for the year was \$592,000. The requirements for admission to the College of Medicine and Surgery were raised so as to include one year of college work in addition to four years of high school work. There were constant accessions to the library and to laboratory equipments amounting to about \$10,000 during 1902.

MISSIONARY ASSOCIATION, AMERICAN, a Congregational society, organized in 1846, which carries on missionary and educational work, a feature of the latter being industrial training, among six different peoples comprised in the population of the United States. Its largest field is in the South, where there are missions and schools for negroes and the mountaineers; work is conducted also in Alaska and Porto Rico, and among the Indians and the Chinese. The association (1901-02) is represented by 749 missionaries, and under its auspices are 107 educational institutions with 15,959 pupils, and 254 churches having 14,071 members. For negroes there are six institutions of higher education. The total receipts for current expenses were \$368,819.50, or, including the income from special funds, \$464,290.84. At the fifty-sixth annual meeting in New London, Conn., October 21-23, were

presented addresses on the various fields of the organization, while that of the president, Rev. Washington Gladden, D. D., dealt with the "fundamental requisites for the elevation of a race and the obligations of an advanced race toward its inferiors." The fact that the association had passed the fifth successive year without debt was a cause for gratification. In 1903 the meeting will be held in Cleveland, O. The *American Missionary*, published monthly, has increased considerably in circulation during the past two years. Corresponding secretaries, Rev. A. F. Beard, D. D., Rev. F. P. Woodbury, D. D., Rev. C. J. Ryder, D. D.; treasurer, H. W. Hubbard: Fourth Avenue and Twenty-second Street, New York City.

MISSIONS, PROTESTANT FOREIGN. Steady progress along the ordinary lines of missionary activity, rather than great events, characterized the history of foreign missions in 1902. China, Japan, India, Africa, and the Philippines were the fields that came most prominently into notice. At home interest in the work of missions was indicated by several important gatherings. Among these were the national convention of the Disciples of Christ in Omaha, Neb., which is said to have been the most successful missionary rally in the history of the denomination; the general missionary conference of the Methodist Episcopal Church in Cleveland, O.; and in the Protestant Episcopal Church, the Advent missionary meetings in New York City and vicinity. The convention of the Methodist Episcopal Church, in some respects, the most remarkable missionary gathering of the year, was the first general missionary conference ever held by that body; more than \$300,000 was raised for missions at this meeting, which was made of special interest by the presence of representative workers from various mission lands. That the student volunteer movement is a great factor in the missionary world of to-day was proven by the fourth international convention in Toronto, Canada, February 26 to March 2. This convention, with a central theme, *The Evangelization of the World in this Generation*, says the *New York Independent*, "sounded the strongest call yet uttered for volunteers . . . for the foreign field, and gave evidence of such a response to that call as the world has not yet known." One hundred persons announced their purpose to become missionaries; and \$15,000 annually for the next four years' work was pledged. Nearly 3000 delegates, representing 22 countries and 465 colleges, attended the convention.

Much interest was taken in the subject of economy of administration during the past year, the advances toward federation of the various Baptist and Congregational societies, in particular, being noteworthy. The Methodist Episcopal Church, too, has made some tentative steps toward consolidation of its benevolent organizations. The incorporation of a bureau of missions, with headquarters at 287 Fourth Avenue, New York City, was among the prominent events of 1902. This institution, which has been entrusted with the library, museum, and other property of the ecumenical missionary conference of 1900, whose influence it seeks to perpetuate and increase, is to serve also as a general bureau of information. Its trustees have been selected from several different denominations, and are men eminent in mission work. Its officers are: Alexander Maitland, president; S. D. Scudder, treasurer; and Rev. Edwin M. Bliss, D. D., secretary. The various missionary societies, considered collectively, are in a prosperous financial condition; contributions, generally, were larger than those of 1901, and never before were so many organizations free from debt. A further advance is shown in the augmented force of workers. Another interesting feature of the year was the increase in influence of the lay element. This movement, of course, has been going on for some years, and in 1902, was perhaps more noticeable in the field of home missions, inasmuch as two of the more important appointments were made on home mission boards.

Greater accessibility of the field is one of the most encouraging features to be noted in connection with the foreign mission work of the present time. It is stated on missionary authority, that the influence of non-Christian religions is growing less, especially with the educated classes. This is particularly noteworthy in the case of Mohammedanism, inasmuch as its adherents are known for their inaccessibility and for faithfulness to their religion. Practical results of missionary enterprise are shown by the increase in the number of self-supporting churches and by the growth of the missionary spirit in the native church. In some mission lands, it is believed, the native church would still flourish, were all missionaries withdrawn. Cooperation among the various denominations in the foreign fields is more marked than it is at home. As instances of this tendency may be cited the union evangelistic movement in Japan, the efforts toward organic union of the Presbyterian and Reformed bodies in India and China, the establishment of a joint missionary publishing house at Shanghai, with other considerations in behalf of federated interests, by the Methodist Episcopal and the Methodist Episcopal, South, churches, and the Evangelical Union of the Philippines which includes all Protestant organizations at work in the islands, excepting the Episcopal Church.

There are in the United States some 50 foreign missionary societies, the oldest

of which, the American Board of Commissioners of Foreign Missions, was established in 1810. Most of these are agencies of the denominations; some, however, are independent organizations. The latest statistics of Protestant foreign missions for the world, as published in the almanac of the American board, are presented in the following summary:

COUNTRIES.	Stations and Out-Stations.	Missionaries.		Native Laborers.	Communitants.	Added Last Year.	Adherents (Native Christians).	Under Instruction.	Income.
		Men.	Women.						
United States.....	6,877	1,590	2,420	19,355	477,961	41,713	984,019	236,076	\$6,168,277

China, as a mission field, is of peculiar interest. The anti-foreign outbreak of 1900 has been succeeded by an apparent reaction, as evidenced by the promulgation of edicts favorable to western civilization and by greater interest in it on the part of the people. The permanent influence of this reform movement, however, may be easily overestimated. There were in 1902 uprisings in the provinces of Sze Chuen and Hu Nan, resulting in the massacre of two missionaries and a number of converts. The increased taxes imposed to meet the indemnity for losses by foreigners in 1900 form an additional source of discontent to the Chinese. Twenty-five per cent. of this indemnity to missionaries and missionary societies was paid in 1902. The reorganization of mission work in almost all sections of the country has been accomplished. *Japan* is one of the most encouraging mission fields, success in that country being ascribed largely to effective organization. The union evangelistic movement, in which all but one of the Protestant denominations there operating are interested, was begun in 1901 and was continued in 1902. Union evangelistic work is conducted practically throughout the main island. This cooperation movement is important as it represents an entirely new phase of Christian, as well as missionary, development. The alliance between Japan and Great Britain is worthy of note since it secures for the present, the independence of Corea and favorable opportunity to continue missionary operations in that land. In *India* the year 1902 was marked by a great missionary conference of all evangelical bodies at work in that country. This, the fourth decennial conference, the previous meetings having been at Allahabad (1872), Calcutta, and Bombay, was held at Madras, in December, and was attended by 300 delegates representing 60 societies. The most interesting topic of the conference was the growth of the work in the last ten years, as indicated by the figures of the census of 1901 which show a total Christian population of 2,923,349. Of this total the Protestant Christians number 1,148,259, more than twice as many as in 1891, while the per cent. of gain of all Christians was 28. The conference issued an appeal asking for a fourfold increase in the force of missionaries. It is estimated that Protestant missions in India require an annual expenditure of more than \$3,000,000. The Evangelical Union of the *Philippines* celebrated its first anniversary in 1902. The territorial divisions, as agreed upon at the inception of the organization, have been faithfully observed by the various missionary bodies. The American board entered the Philippines in 1902. The Protestant Episcopal Church, under the leadership of the recently created bishop of the Philippines, Charles H. Brent, began last year on a great movement in behalf of the English speaking population, as well as of the natives. The Methodist Episcopal and Presbyterian churches also have in view plans for extended operations. Much money is being raised by the denominations for church work in the islands, a fund of \$1,000,000 having been projected by Episcopalians. The cause of the movement under Aglipay (see ROMAN CATHOLIC CHURCH) has been ascribed to the awakening of the Filipinos to a desire for religious freedom. In *Africa* the rapid development of missions in the populous kingdom of Uganda, Central Africa, is noteworthy. The converts there now number some 30,000 with 2000 native evangelists and 700 churches; ten years ago there were but 200 converts. This church is self-supporting. Missions were established in 1902 in the vicinity of Khartum.

Perhaps no single event of the missionary world in recent years attracted more general interest than the capture by brigands in 1901 of Miss Ellen M. Stone, a missionary of the American board in Macedonia. Miss Stone was released February 23, 1902, on payment of a large ransom. The most important publication on foreign missions in 1902 was the work of the Rev. James S. Dennis, *Centennial Survey of Foreign Missions*, a statistical review of missions at the end of the last century.

MISSISSIPPI, a Gulf State of the United States, has an area of 46,810 square miles. The capital is Jackson. Mississippi was organized as a Territory April 7, 1798, and admitted as a State December 10, 1817. The population in 1900 was 1,551,270; in June, 1902, as estimated by the government actuary, it was 1,603,000. Populations of the three largest cities in 1900 were: Vicksburg, 14,834; Meridian, 14,050; and Natchez, 12,210.

Agriculture.—The cotton crop of Mississippi for 1902 was approximately 1,350,000 bales. The other principal crops as given by the *Crop Reporter* for 1902 were: Corn, 2,144,225 acres, 24,658,588 bushels, value \$15,041,739; oats, 117,419 acres, 1,808,253 bushels, value \$922,209; hay, 40,175 acres, 56,245 tons, value \$576,711.

Legislation.—A special session of the Mississippi legislature convened on January 7, 1902, and adjourned March 5. Among the laws passed were the following:

A primary election law providing for the nomination by popular vote and in accordance with the regulations of the election law in force at the time, of candidates for congressional, State, district and county offices. In order to be eligible to vote in primaries electors must have voted with their party within two years and must have intended to support its nominated candidates. Only the name of the candidate nominated is to be placed upon the official ballot, and if any candidate not so nominated at a primary election shall be elected to office, his election shall be declared void. Nominations for United States senator are to be held under the same regulations governing nominations of State officers.

To provide for the better enforcement of the existing anti-trust laws, and especially of the drastic anti-trust law of March 12, 1900, it was enacted that proceedings may be brought against illegal trusts in the county where they were formed, or in the county where any law had been violated, or in the county where any of the individual defendants might be found. Witnesses may not be excused from testifying on the ground of self-incrimination, nor shall corporations be excused on that ground from producing their books and records, but such testimony or written evidence shall not be used as a basis for prosecuting those who brought it forward.

A department of insurance was created to attend to all those matters regarding the regulation and supervision of insurance companies which had previously been performed in its different aspects by the secretary of state, auditor of public accounts, and state treasurer. The department was to be managed by a commissioner of insurance, to be elected at the general elections in 1903.

A joint committee of the senate and house was appointed to investigate the reasons for the resignation as treasurer of J. R. Storer on September 6, 1901. As reported by the governor to the legislature, and as a matter of common knowledge at the time, the treasurer's accounts were short more than \$100,000 on August 15, 1901, but this sum had been made up by August 20. As a result of the uneasiness which this event caused, the legislature made the bond requirements of State officers much more exacting, the treasurer being required to furnish \$250,000.

Constitutional Amendments.—Three constitutional amendments were submitted to the people in November, 1902. The first one permitted any county, city, or town to hold stock in railroads on an affirmative vote of the taxpaying electors of such locality, providing that such investment should not exceed 10 per cent. of the assessed valuation of the property in said locality. This amendment was approved by a majority of 201. A second amendment, providing for a form of referendum upon constitutional amendments, failed of approval. A third amendment, authorizing a regular session of the legislature every two years instead of every four years, was approved by the voters.

State Officers.—For 1902 and 1903: Governor, A. H. Longino (elected for four years, term ending January, 1904); lieutenant-governor, James T. Harrison; secretary of state, J. W. Power; treasurer, Thad B. Lampton; auditor, W. Q. Cole; superintendent of education, H. L. Whitfield; attorney-general, Monroe McClurg; land commissioner, E. H. Nall; revenue agent, Wirt Adams—all Democrats.

Supreme Court for 1902 and 1903: Chief justice until May 3, 1903, when his successor will be appointed by the governor, Albert H. Whitfield; associate justices, S. H. Terral, and S. S. Calhoun—all Democrats.

For Congressional representatives, see UNITED STATES (paragraph Congressional Representatives).

MISSOURI, a west central State of the United States, has an area of 69,415 square miles. The capital is Jefferson City. Missouri was organized as a Territory

December 7, 1812, and admitted as a State August 10, 1821. The population in 1900 was 3,106,665; in June, 1902, as estimated by the government actuary, it was 3,196,000. The populations of the four largest cities in 1900 were: St. Louis, the fourth largest city in the United States, 575,238; Kansas City, 163,752; St. Joseph, 102,979; and Joplin, 26,023.

Finance.—The balance in the treasury on January 1, 1902, was \$1,243,130.97. The receipts during 1902, including transfers, were \$7,601,009.32. The disbursements during the same year, including transfers, amounted to \$6,845,737.58, and the balance on December 31, 1902, to \$1,998,402.71, of which \$568,741.04 was credited to the State or revenue fund, and \$520,204.38 to the State sinking fund. The outstanding debt December 31, 1902, was \$487,000, a reduction during the year of the bonded debt by \$1,400,000.

Agriculture.—The leading agricultural crops of Missouri for 1902 as given by the *Crop Reporter* were as follows: Corn, 6,775,195 acres, 264,232,605 bushels, value \$87,196,760; winter wheat, 2,827,462 acres, 56,266,494 bushels, \$32,634,567; oats, 855,822 acres, 27,816,165 bushels, \$7,788,526; potatoes, 95,579 acres, 12,234,112 bushels, \$4,281,939; hay, 2,698,654 acres, 4,290,860 tons, \$29,564,025.

Industries.—There was a remarkable increase in the output of the lead and zinc mines in 1902. Unexpectedly well-sustained prices were the principal cause of the activity. Lead ores from the southeastern part of the State increased from 57,898 tons in 1901 to 74,363 tons in 1902. More zinc ore was mined than ever before. By December 1, 1902, 254,000 tons had been produced—almost equalling the total output of 256,920 tons in 1901. The spelter produced in Missouri and Kansas was, in 1901, 87,353 tons; in 1902, 98,362 tons. Most of the ore came from the Joplin district in Missouri and some from Colorado. Improvements in and about St. Louis, involving the expenditure of \$75,000,000, were begun by the Exposition company, the city, and the railroads. The largest bridge under construction in the United States was over the Mississippi River to connect the Missouri Pacific with the Illinois Central Railroad at Thebes, Ill. The following table gives statistics of the leading industries for 1901:

	Total Capital Invested.	Total Value of Goods Manufactured.	Total Number Employees.	Total Amount of Wages Paid.
Packing houses	\$2,337,782	\$49,057,226	3,881	\$2,210,673
Tobacco factories.....	3,209,251	21,073,849	3,276	1,904,485
Flouring mills.....	4,274,425	20,192,822	1,906	1,024,453
Liquors, malt	22,839,262	17,278,691	5,150	3,384,133
Boots and shoes.....	2,188,300	13,265,367	8,224	2,874,149

Railroads.—Including all tracks there were, in 1901, in the State of Missouri, 8,656.26 miles of railroad, represented by a capital of \$26,978 per mile, a bonded debt of \$24,431 per mile, making a total of \$53,414 of capital and bonds per mile of road. There were 54,273,500 passengers carried during the year and 93,309,855 tons of freight were hauled.

Elections.—At the regular election, held November 4, 1902, the only officer voted for was judge of the Supreme Court. The Democratic candidate, Valliant, received 273,081 votes, as against 228,398 for Higbee (Rep.).

Conventions and Platforms.—The Republican State convention, held at Jefferson City on June 24, 1902, indorsed the acts of President Roosevelt at home and abroad; favored him as the ideal candidate for President in 1904; upheld the pending Congressional legislation for the Philippines; opposed trusts and combinations in restraint of trade, and favored legislation both national and State to protect the public from this evil; demanded ballot reform and an investigation into charges against the Democrats of squandering State funds, and declared for local self-government of municipalities and for the granting of municipal franchises only by direct vote of the people. The Democratic State convention, held at St. Joseph on July 22, 1902, reaffirmed the Kansas City platform; favored the suppression of trusts and combinations with a tendency to destroy competition; urged the removal of the duty from trust-made products; denounced the Fowler bill; indorsed Governor Dockery's administration; favored municipal ownership of public utilities, and the decision by the people as to when and how such industries should be taken over; supported the plan for a constitutional amendment to provide for direct legislation by the initiative and referendum; pledged the party to enact arbitration laws and child labor laws; and condemned government by injunction.

Other Events.—Judge John F. Phillips, of the United States District Court of Kansas City on March 25, issued a temporary restraining order against eight railroads, connecting Chicago with Kansas City and Kansas City with St. Louis, on application of Judge William A. Day, counsel for the Interstate Commerce Commission, who asked that the roads be enjoined from deviating from published

schedules. The St. Louis board of health, on February 12, dismissed from public service Dr. Armand Ravold, for permitting to be sold and used antitoxin serum which he knew to be impure, thus being accessory to the deaths of thirteen children from tetanus after inoculation. See LOUISIANA PURCHASE EXPOSITION and MUNICIPAL GOVERNMENT.

State Officers.—For 1902 and 1903: Governor, Alexander M. Dockery, elected for four years, term ending January, 1905; lieutenant-governor, John A. Lee; secretary of state, Sam. B. Cook; treasurer, Robert P. Williams; auditor, Albert O. Allen; attorney-general, E. C. Crow; superintendent of public schools, Wm. T. Carrington; secretary of the board of agriculture, Geo. B. Ellis; superintendent of insurance, Robert G. Yates; commissioner of labor, William Anderson—all Democrats.

Supreme Court for 1902 and 1903: Chief justice, Gavon D. Burgess; associate justices, Theodore Brace, Waltour M. Robinson, William C. Marshall, Leroy B. Valliant, Thomas A. Sherwood (in 1902), James D. Fox (in 1903), James B. Gantt—all Democrats except Robinson, Republican.

For congressional representatives, see UNITED STATES (paragraph Congressional Representatives).

MITCHELL, JOHN, president of the United Mine Workers of America, came into great prominence during 1902 through the large strike in the anthracite coal regions. He was born at Braidwood, Ill., February 4, 1869, and went to school until ten years of age. Thereafter he chiefly educated himself, paying special attention to economic questions. When thirteen years of age he went to work in the coal mines, and in 1885 joined the Knights of Labor. In 1895 he was elected secretary-treasurer of a district organization of the United Mine Workers, in 1897 a national organizer, 1898 a vice-president, and in 1899 president of the organization. As president he led the great strike of 1900 in the bituminous coal regions, and the success of this strike increased greatly the membership in both the bituminous and the anthracite coal regions. Mr. Mitchell was the leader throughout the great coal strike of 1902, an account of which will be found in the article **STRIKES**.

MONTANA, a northwestern State of the United States, has an area of 147,080 square miles. The capital is Helena. Montana was organized as a Territory, May 26, 1864, and admitted as a State, November 8, 1889. The population in 1900 was 243,329; in June, 1902, as estimated by the government actuary, it was 264,000. In 1900 the populations of the three largest cities were: Butte, 30,470; Great Falls, 14,930; and Helena, 10,770.

Finance.—There was in the treasury of Montana at the beginning of the biennial term ending November 30, 1902, \$514,627.16. The receipts of the treasury during the first year of the term were \$1,343,838.75 and during the second year \$1,454,932.14. The disbursements during the first year of the term were \$1,303,779.04 and during the second year \$1,412,894.25. There remained on hand November 30, 1902, \$596,724.76. The main items received into the general fund, applicable to the ordinary governmental expenses were: From taxes, \$807,800.44; from the inheritance tax, \$72,662.59; and from licenses, \$310,513.43.

Agriculture.—Although primarily a mining State, agriculture is important. The principal crops under cultivation for 1902, with the yield and value of crops, were given in the *Crop Reporter* as follows: Spring wheat, 90,583 acres, 2,355,158 bushels, value, \$1,460,198; oats, 159,154 acres, 6,668,553 bushels, \$2,400,679; barley, 17,874 acres, 661,338 bushels, \$337,282; potatoes, 11,521 acres, 1,762,713 bushels, \$881,356; hay, 313,606 acres, 526,858 tons, \$3,972,509.

A unique feature of agriculture in the State is the Montana Cooperative Ranch Company, owning 8440 acres of land in the Sweet Grass Hills, near Shelby, on which are pastured 12,000 to 15,000 sheep besides hogs and Angora goats. The plan upon which the ranch is operated allows the stockholders in the company to place sheep or other stock upon the land with no expense whatever for their care. The land and improvements belong to the company. The dividends from the general business are divided among the stockholders as well as one-half the increase and profits derived from the flocks and herds they individually own. The enterprise has proved very successful, and declared a dividend of 10 per cent. on January 1, 1903.

For production of minerals, see **GOLD**, **SILVER**, etc.

Conventions and Platforms.—The Democratic State central committee, at a meeting on September 2, 1902, selected F. A. Heinze, of Butte, for senator. At a State convention held at Helena on September 22 to nominate legislators and county officials, forty-three delegates were chosen to attend the State convention at Bozeman on the following day. United States Senator Clark secured 26 county delegates at that convention, Heinze getting only two. This gave renewed control of the Democratic party in the State to the Clark faction. Heinze then formed a new party, known as the Populist party, with a view to splitting the vote. The Democratic platform at the convention on September 24 declared for the eight-hour law

in Montana. Trusts and the administration's policy in the Philippines were condemned.

The Republican platform declared for Roosevelt for President in 1904; favored a duty on woollen products; demanded protection for American industries, with limited revision of the tariff as proposed by Mr. Roosevelt, indorsed the administration's trust policy; favored a reasonable civil government for the island possessions; and commended the action of the President in enforcing the law against fencing public domain.

Elections.—At the regular election, held November 4, 1902, the only officer voted for was justice of the Supreme Court. Holloway (Rep.) was elected, receiving 31,690 votes, as against 21,204 for Leslie (Dem.), giving the Republican candidate a plurality of 10,486.

State Officers.—For 1902 and 1903: Governor, J. K. Toole (elected for four years, term ending January, 1905); lieutenant-governor, F. G. Higgins; secretary of state, G. M. Hays; treasurer, A. H. Barret; auditor and insurance commissioner, J. H. Calderhead; attorney-general, James Donovan; superintendent of education, W. W. Welch; land registrar, Thomas D. Long—all fusion Democrat-Populists.

Supreme Court for 1902 and 1903: Chief justice, Theodore Brantly; associate justices, William T. Pigott (in 1902), William L. Holloway (in 1903), and George R. Milburn.

For congressional representatives, see UNITED STATES (paragraph Congressional Representatives).

MONTENEGRO, an independent principality in southeastern Europe, constituting one of the Balkan States, has an estimated area of 3630 square miles, and a population of about 230,000. The capital is Cetinje, with 4000 inhabitants, and the largest town, Podgoritz, with 6534 inhabitants. The Montenegrins belong to the Servian branch of the Slav race, and are largely adherents of the Greek orthodox church. The government is patriarchal in form, the executive power being exercised by the native prince, Nicholas I., who succeeded in 1860, and whose will is practically absolute. He is assisted by a council of eight, half of whom are appointed by the prince, and half elected by the male inhabitants, who are bearing, or have borne, arms. The tribal organization still exists for administrative purposes, the entire country being divided into forty districts, corresponding to as many tribes, each governed by elected "elders," and a chief or captain, whose powers are those of a magistrate in peace, and a commander in war. No standing army exists, but all male inhabitants are liable for military service. There has been a regular budget only since 1901, the revenues and expenditures balancing in 1902 at 881,662 florins. The revenue is derived chiefly from customs, land taxes, and monopolies. Montenegro has no coinage of its own, the florin in use being that of Austria, valued at 40.6 cents. The public debt amounts to 960,000 florins. The country is very mountainous, little of it is fit for cultivation, and agricultural methods are of the most primitive kind. The small crops of maize, barley, potatoes, oats, and buckwheat are scarcely more than sufficient to supply the home demand. There are practically no manufactures. The chief occupations of the inhabitants are pastoral, and live stock, hides, dried meats, wool, cheese, beeswax and honey constitute the bulk of the exports, which in 1898 were valued at 1,179,960 florins. The imports in the same year amounted to 1,405,580 florins.

Early in March, 1902, the betrothal was announced of Prince Mirko, the second son of Prince Nicholas, to the daughter of a high Servian official formerly of King Alexander's household.

MONTÉPIN, XAVIER AYMON DE, a French novelist, died April 29, 1902, at Paris. He was born March 18, 1824, in Apremont, in the department of Haute-Saône. In 1848 he founded *Le Canard*, a short-lived political paper characteristic of the time, and contributed to anti-revolutionary journalism, but he soon abandoned politics for literature. A long series of romances came from his pen with amazing rapidity, aggregating nearly a hundred titles, not including numerous plays. The fact that these books must have earned a considerable fortune, is signified by the valuation of 400,000 francs that was placed on his losses when his house was burned in 1881. Some of his more familiar titles, suggestive of their school, and characteristic of his others, are: *Les Chevaliers du lansquenet* (1847); *Les Viveurs d'autrefois* (1848); *Mademoiselle Lucifer* (1852); *L'Officier de fortune* (1857); *Les Marionnettes du Diable* (1861); *La Maison maudite* (1867); *Son Aliesse l'amour* (1881); *Trois Millions de dot* (1891). In his plays he collaborated with several authors, particularly M. Alexandre Dumas and M. J. Dornay.

MONTSERRAT. See LEEWARD ISLANDS.

MOODY, WILLIAM HENRY, a Republican congressman, was named on March 10, 1902, as secretary of the navy to succeed John D. Long, resigned, and assumed office on May 1. Secretary Moody was born in Newbury, Mass., December 23, 1853, and

graduated from Phillips Andover Academy in 1872, and from Harvard University in 1876. He studied law after graduation, and his first public office was the small one of solicitor of Haverhill, Mass. He was then appointed United States attorney for the eastern district of Massachusetts, and held this office from 1890 to 1895. In this position he established his reputation for ability and indomitable energy. He was elected to Congress in 1895 to fill the vacancy caused by the death of General Cogswell, and was re-elected to the Fifty-fifth, Fifty-sixth, and Fifty-seventh Congresses. Early in his congressional career he won the special regard of Speaker Reed, who made him a member of the important committee on appropriations. He also served on the committee of insular affairs, and in that connection became greatly interested in naval progress. He has, since assuming office, continued the policy of his immediate predecessors of increasing the size and efficiency of the navy, and has tried to solve the vexed problem of obtaining sufficient officers and men for the vessels.

MOORE, EDWARD MOTT, an American physician, died in Rochester, N. Y., March 3, 1902. He was born in Rahway, N. J., July 15, 1814, studied at the Rensselaer Polytechnic Institute, Troy, N. Y., and graduated in 1838 at the medical school of the University of Pennsylvania. Beginning practice in Rochester, whither his family had removed in 1830, he soon became prominent in his profession; was the first president of the New York State Board of Health, and from 1858 to 1883 was professor of surgery in the Buffalo Medical College. His other official connections included duties as president of the National Surgical Association, the National Medical Association, and of the New York State Medical Society. He made many valuable researches into the action and diseases of the heart, and contributed widely to medical journals. He was actively interested in the municipal government of Rochester and rendered valuable services as president of the park board.

MORAES BARROS, JOSÉ PRUDENTE DE, ex-president of Brazil, died December 3, 1902. He was born in 1841 at Itú, São Paulo, studied law and was admitted to the bar in 1863, and in 1866 was elected to the state legislature. His espousal of republican doctrines in 1870, threatened for a time to doom his political career, but in 1879, with two other republicans, he was elected again to the assembly. He became one of the leaders of the small republican party, and in 1885 was elected to the national legislature, being the first republican to gain admission. In 1889, after the deposition of Dom Pedro, he was appointed governor of São Paulo, and immediately afterward was elected senator. He became president of the constitutional assembly, was defeated for president of the new republic in 1891, but in 1894, when the rebellion was at its height, was elected by a majority which won an overwhelming victory over the military party. He was forced to retire in November, 1896, but was re-elected in 1897. In 1898 he was defeated for the presidency by Campos Salles.

MORAVIAN CHURCH, or UNITAS FRATRUM, founded in 1457, thus claiming the distinction of being the first Protestant Episcopal Church, though it apparently became extinct through persecution, but reappeared in 1727. The church embraces three provinces, the American, European, and British, including 39,323 members, and many missions, in which are 464 missionaries and 96,833 members, 92,075 of whom are communicants. In the United States and Canada there are 129 ministers and 117 churches, and 15,773 communicants, an increase of 548 during 1902. The number of members is 23,896. The European province has 7772 members and the British province 6058; the Bohemian mission, 726. The bishops of the church number 26, of whom 6 are in the American province. Several new churches were erected during the past year in the American province, and the work was extended in Alberta, Canada, in northwestern United States, and in North Carolina. The Moravian Church is noted especially for its missionary and educational activities. It entered upon mission work in 1732, and since that date has established organized stations in various parts of the world, besides *diaspora* missions. The entire cost of mission work during the past year was \$442,803, exclusive of the income (\$68,554) of the Morton Legacy, which was devoted to new stations. In Jerusalem, the Moravians maintain a leper hospital and they are laboring also among the lepers in South America. The educational institutions of the American province comprise a college and theological seminary in Bethlehem, Pa., and schools at Nazareth, Bethlehem, and Lititz, Pa., and at Salem, N. C. About 500 students are enrolled. There is a theological seminary for the education of native ministers in the West Indies; also various institutions in Europe. Among a number of periodicals representing the church is the *Moravian*, issued weekly at Bethlehem, Pa., where the publication office of the American province is located. A fund of \$50,000 has been created, the interest of which is used for the erection of new churches, and several other funds are applied to special fields of denominational activity. During 1902 an important meeting of the presiding board of the entire church was held in Germany, representatives from the various provinces being in

attendance. In 1903 will be held a provincial synod of the northern province of the United States, that of the southern province having convened last year.

MORGAN, THOMAS J., a Baptist clergyman, died July 13, 1902, at Ossining, N. Y. He was born August 17, 1839, in Franklin, Ind., studied at Franklin College, but, without finishing his course, enlisted in the Seventh Indiana Volunteers at the beginning of the Civil War. In 1862 he became a lieutenant in the Seventieth Indiana Volunteers. Before the end of the war he rose to the command of a brigade as brevet brigadier-general. In 1868 he graduated at the Rochester Theological Seminary. From 1874 until 1881 he was professor of church history at the Baptist Theological Seminary in Chicago, from 1884 to 1889 president of the Normal School of Providence, R. I., and from 1889 to 1893 a United States Indian commissioner. In 1893 he became corresponding secretary of the American Baptist Home Mission Society, a capacity in which he served until his death. He edited the *Home Mission Monthly*, and published *Studies in Pedagogy* (1888); *Patriotic Citizenship* (1895); and *The Negro in America* (1900).

MORMONS, or LATTER DAY SAINTS, a Christian sect organized in 1830 by Joseph Smith, the prophet of Mormonism, and the author of the *Book of Mormon*, which purports to be a divinely revealed history of ancient America. After the death of the prophet in 1844, there were several schisms, the main body of the Mormons following the leadership of Brigham Young, while a considerable number held that the rightful successor of Joseph Smith was his eldest son. The latter division, sometimes called non-polygamous Mormons, for they deny the authenticity of the revelation on polygamy made public in 1852, claims to represent the true principles of the church, and to be the "lawful continuation of and successor to the original Church of Jesus Christ of Latter Day Saints." Reorganization was effected in 1853, and in 1860 Joseph Smith, the son of the prophet, became president.

Church of Jesus Christ of Latter Day Saints now includes 50 "stakes of Zion," more than half of which are in the State of Utah, and 20 missions, having an approximate membership of 350,000. During the year there were organized within the "stakes" 15 new wards. The priesthood of the church numbers 62,445, the lesser or Aaronic order comprising 25,700 bishops, priests, teachers, and deacons. The whole body of priesthood is divided into foreign and home ministries. The former consists of the twelve apostles and the quorums of seventy (143), making in all some 10,000 persons who are engaged in the propaganda of Mormonism. In addition to the regular church organization, there are a number of auxiliary bodies with a total membership of 204,150. Quarterly conferences are held in each "stake," and general conferences of the church, semi-annually in April and October. Considerable attention was attracted in 1902 to the success of the Mormon missions in the United States. In the foreign fields, too, there were gains, notably in Denmark, Germany, and Switzerland, the dedication of a temple in Copenhagen having been one of the features of the year. The *Deseret News*, issued daily and semi-weekly at Salt Lake City, is the official organ of the church. President, Joseph F. Smith; first and second counsellors in the first presidency, John R. Winder and Anthon H. Lund.

Reorganized Church of Jesus Christ of Latter Day Saints, with headquarters at Lamoni, Ia., comprises two "stakes of Zion" (Lamoni, Ia., and Independence, Mo.), besides mission and district conferences, the church being represented in the United States and Canada, Great Britain, Scandinavia, Australia, and in the Society and Sandwich Islands. It has 650 local organizations, about 800 ministers, and 55,500 members. There are more than 200 church edifices, and the value of church property is estimated at \$800,000. Graceland College, at Lamoni, is under the auspices of the Reorganized Church; and publishing houses are maintained in Lamoni and Independence, the official organ, the *Saints' Herald*, being issued weekly in Lamoni. The annual world's conference in 1902 was held in Lamoni, April 6-21. President, Joseph Smith; secretary, R. S. Salyards; patriarch, A. H. Smith; bishop, E. L. Kelley.

MOROCCO, a Mohammedan empire in northwestern Africa. The capital is Fez, but Morocco City (Marakesh) and Mekines are also residences of the sultan.

Area and Population.—The area of Morocco cannot be closely estimated since the southern boundaries are undefined, but the figure usually accepted is 219,000 square miles. The population is still less definitely known; 4,000,000, perhaps, is a fairly approximate estimate. Fez has about 140,000 inhabitants. The people of Morocco belong to the Malekite sect of the Sunnite Mohammedans.

Government, etc.—Morocco is an absolute monarchy, the sultan being the supreme authority in matters both civil and religious. His real power, however, depends largely upon circumstance and his own character. He is assisted by six ministers of state, who theoretically are only the executive of his unrestricted will. The sultan in 1902 was Mulai-Abd-el-Aziz, who was born in February, 1878, and succeeded his father in June, 1894. He did not come into real power, however, until the death

of the grand vizier, Sid Ahmed Ben Musa, in May, 1900. In 1902 the grand vizier was Sid Emfadi Gharrit; minister for foreign affairs, Sid Abdelcrim Ben Sliman; commissioner for foreign affairs at the port of Tangier, Sid Hadji Mohammed Torres; instructor-in-chief (of the army), Kaid Sir Harry Maclean. Representatives of fourteen nations reside at Tangier. The regular army comprises about 10,000 infantry and 400 cavalry; in addition there are some 2000 irregular cavalry, and militia forces, foot and horse, numbering about 18,000. The annual revenue of the sultan, derived largely from monopolies, taxes, and extortion, is estimated at about \$2,400,000.

Industries and Commerce.—Agriculture and the rearing of live-stock are the leading industries. There is a limited manufacture of carpets and slippers. The mineral resources are undeveloped. The principal crops include cereals, pulse, fruit, esparto, and hemp. Imports and exports in 1900 were reported at \$7,925,200 and \$8,675,500 respectively; in 1901, \$8,465,340 and \$6,434,978 respectively. The principal imports are cotton goods and other textiles, sugar and provisions, and iron, steel, and brass ware. The values of the leading exports in 1901 were stated as follows: Eggs, \$891,548; beans, \$715,049; oil, \$681,743; pease, \$470,819; oxen, \$312,775; almonds, \$286,282; carpets, slippers, skins, and hides, \$1,100,244. About half of the foreign trade is with Great Britain.

History.—In 1902 the progressive policy of the young sultan led to disaster. It will be remembered that after the death of Sid Ahmed Ben Musa, the sultan began to introduce various reforms,—among others, for a more just taxation, for the betterment of prisons, and for the amelioration of oppressive customs tariffs. Undoubtedly he was actuated by a sincere desire to benefit his subjects, but they, bound by the tradition of centuries, distrusted him. He gave an unusual amount of attention, for a Moslem ruler, to European affairs, and especially took an active interest in various articles of European manufacture, such as bicycles, automobiles, and cameras, all of which aroused in his subjects a very real antagonism. Moreover, he violated Mussulman tradition by seeking to protect Christians and to place foreigners on an equal footing of safety with Moors. In October, 1902, Dr. David J. Cooper, an English missionary, was murdered by a Moor in Fez. Although the culprit took refuge in a mosque, he was arrested and shot by order of the sultan. This brought about the culmination of discontent. Already there had been tribal uprisings in 1902 (in northern Morocco), and in September a rather serious outbreak had been suppressed. Conditions were now ripe for a really formidable rebellion, and a leader was forthcoming in the person of Omar of Zarahun, known as Bu Hamara, "the Father of the She Ass." Omar, it was said, was a man of middle age and had once been a soldier in the Moorish army. Later he had gone to Tunis and Algeria, where he had acquired some education, and returning to Morocco had set up as a religious teacher and precursor of a Mahdi. Astride a white ass and professing lowliness of heart, he gained power over the simple-minded tribesmen and finally succeeded in passing himself off as the elder brother of the sultan, Mulai Mohammed. The latter had been imprisoned at Mekines for disputing the throne upon the death of his father. Thus in the eyes of the tribesmen Bu Hamara represented not only a worthy political cause, but the true religion itself. On October 25 he and his followers arrived at Tesa, near Mekines, and on November 3 they were defeated by the imperial troops, whereupon the pretender fled to the mountains of Ghiata. (About this time the Benider Kabyles near Tetuan rebelled, but were quickly subdued by the governor of Tetuan.) The sultan led a force against the Berber tribes in the Zimmur country, and on November 10 marched to Mekines. Reports were then made that the insurrectionary movement of the pretender was ended and was causing no more anxiety. But on the 29th the forces under the sultan's brother, Mulai el Kebir, were defeated by the pretender at Tesa, and the sultan withdrew to Fez, which he entered on December 9. The jihad of Bu Hamara, or holy war against Christians and for the overthrow of the sultan on account of his European tendencies, now increased in strength, and by December 20 the pretender's forces were estimated to number 30,000. Another imperial expedition was made against Bu Hamara, and on December 23-24 a battle was fought at Tesa, in which the government troops suffered a crushing defeat. About 2000 of them, it was reported, were killed, and the remainder, leaving their artillery, tents, money, and many rifles and much ammunition, fled in confusion to Fez. The pretender then started to march on Fez, where at the end of the year the sultan and his supporters were shut up. On December 31, 1902, Kaid Sir Harry Maclean, instructor-in-chief of the army, arrived at Tangier from England and proceeded up country.

The insurrection concerned not only Morocco itself, but several European nations. Spain has traditionally certain rights in the event of a break-up of Morocco, and France not only desires such a break-up but doubtless wants the lion's share of the country for herself. Indeed, a French writer has declared that the question of the acquisition of Morocco is a question of life or death to Algeria. There is little

real indication of a change in the forward policy of France, though certain understandings as to boundary were arrived at with Morocco in 1902; but it should be pointed out that in January of that year France and Italy appeared to have come to an understanding whereby Italy would support France in the exploitation of Morocco, and France would play a similar rôle in the interest of Italy's designs upon Tripoli.

MORRIS, PHILIP RICHARD, an English historical painter, died in Maida-vale, London, April 22, 1902. He was born December 4, 1838, in Devonport, England, studied in the British Museum under Holman Hunt, and in the Royal Academy. In 1855 he won a silver medal of the Academy for the best drawing from life, and in 1858 a gold medal for the best historical painting, "The Good Samaritan." At the Antwerp Exhibition, soon afterward, he was awarded the second-class medal. In 1877 he was made an associate of the Royal Academy. He was considered one of the most promising of the coming men at that time, but he had probably already reached his zenith. His subject pictures, and pretty portraits of women and children, never lacked the warmest admirers. He was on the roll of retired honorary members of the Royal Academy, and had exhibited nothing for the last few years. It was only after a struggle with adverse circumstances in early life that he became an artist, and it is thought that the severe labor of those years told on his vitality.

MORTON, HENRY, president of Stevens Institute of Technology, died in New York City, May 9, 1902. He was born in New York City, December 11, 1836, and was educated at the Episcopal Academy of Philadelphia and at the University of Pennsylvania, from which he graduated in 1857. While an undergraduate he distinguished himself by making a translation of the Rosetta Stone and by preparing an illuminated manuscript, which later he reproduced by lithographing. After attempting the study of law, he devoted himself to the physical sciences, for which he had a decided aptitude, and became connected with his old preparatory school as a lecturer. In 1863 he became professor of chemistry in the Philadelphia Dental College and in the following year secretary of the Franklin Institute. At this time public lectures with experiments were in high favor, and many of the most celebrated scientists endeavored to popularize science from the lecture platform. Of these Morton was among the first, and his success added greatly to his reputation, which had rapidly grown through his able editing of the *Journal of the Franklin Institute*. In 1868 the temporary absence of the professor of chemistry and physics at the University of Pennsylvania gave Morton the opportunity to carry on the work in this department, and so successful was he that in the following year he was made a regular member of the faculty and assigned a chair of chemistry. While here he carried on important photographic and other studies, and participated in the work of the United States Solar Eclipse Expedition. In 1870 he was invited to become the head of "an institute of learning" made possible by bequests of Edwin A. Stevens of Hoboken. The trustees accepted Prof. Morton's suggestion that the most advantageous use of the endowment would be the foundation of a school of mechanical engineering, and in 1871 Stevens Institute of Technology was founded and its work begun. Surrounded by a carefully chosen faculty and with the greatest attention to all details connected with its administrative and educational development, Professor Morton soon placed Stevens Institute in the front rank of American scientific schools. He was also a liberal benefactor to the Institute, and gave to it a new workshop (1880), besides organizing at his own expense departments of applied electricity (1883), and engineering practice. It has been stated that these and other gifts to the institution aggregated about \$150,000. President Morton was in constant demand as a scientific expert in litigation and consultation, and in 1878 succeeded Joseph Henry as a member of the United State Lighthouse Board. His best-known chemical researches were concerned in the study of fluorescence, and the absorption spectra of uranium salts and other substances, and he was the discoverer of "thallene," and its modification "petrolucene." He was chosen a member of the National Academy in 1873, and held honorary degrees from Princeton and the University of Pennsylvania, and was a member of many learned and scientific societies both in the United States and Europe. He was succeeded as president of Stevens by Alexander C. Humphreys (q.v.).

MORTON, JULIUS STERLING, secretary of Agriculture during Mr. Cleveland's second administration, died at Lake Forest, Ill., April 28, 1902. He was born at Adams, Jefferson County, N. Y., April 22, 1832. He attended school in Albion, Mich., where his family had removed, and entered the University of Michigan. He left without completing his course, and went to Union College, from which he graduated in 1854. During the same year he married and took up his residence in Nebraska City, where he engaged in farming. He became editor of the *Nebraska News*, the first newspaper of that region, was elected to the territorial legislature the year after its arrival, and was re-elected in 1857. In 1858 he was elected secretary of the

Territory. A few months later, by resignation of Governor Richardson, he became acting governor. The minority of the Democratic party in Nebraska foredoomed his political success locally, but he was barely defeated as delegate to Congress in 1860, and received three nominations for governor. His activity in politics, nevertheless, continued. He was bitter in his opposition to free silver and to protection, did much to encourage forestry in Nebraska, and as secretary of agriculture in President Cleveland's second administration, was conspicuously successful in cutting down useless expenditures, and by securing from Congress an appropriation for the issuing of practical farmers' bulletins. He was a prominent member and president of the Nebraska State Board of Agriculture, and was the originator of Arbor Day, now celebrated throughout the country. He founded the *Conservative*, a weekly journal, in opposition to free silver, and for the advocacy of what he deemed sound political doctrines.

MUNICIPAL GOVERNMENT. There are in the United States about 140 cities, each having a population of 30,000 or more. No two of these cities make their annual financial statements in the same form, so it is practically impossible to make any accurate comparisons of receipts, expenditures, tax rates, municipal assets and liabilities, or any other matters of importance. The United States Department of Labor since 1899 has attempted to compile statistics of cities for purposes of comparison. In order to make these statistics of any value, it was necessary to gain the cooperation of municipal officers and induce them to put the official records into something approaching uniformity. This work of the department has been of very great importance in forcing upon the attention of municipal officers and voters the necessity for a uniform system of accounting, and the movement in this direction steadily gained strength during 1902.

Minneapolis.—The official debauchery in Minneapolis from the inauguration of the Ames administration, January 7, 1901, until the overthrow of that system of organized official vice in 1902, is incredible. The following statement is based mainly on the account of Mr. Lincoln Steffens, who published the result of his personal investigations in *McClure's Magazine*. Dr. Albert A. Ames had served three terms previously as mayor of the city—twice elected by the Democrats and once by the Republicans. The Minnesota primary law of 1900 provided for direct nominations by the people, but did not prevent voters of one party from voting to nominate the candidates on the other party's ticket. At the primaries held in 1900, Ames, who was for the time being a Democrat, instructed his followers to nominate him for mayor on the Republican ticket. This was done, much to the chagrin of the Republicans and the delight of the Democratic leaders, who thought they could easily defeat him. But through the partisanship of the voters and the popularity of Ames, who had a strong personal following of gamblers, thugs, saloon-keepers and "good fellows" generally, he was elected. Immediately after his election, and before his inauguration, he gathered together a body of fellow rascals, and laid plans to "open" the city to outlaws who were to work under police direction for the profit of the administration. On assuming office, he appointed as chief-of-police his brother, Col. Fred W. Ames, and made Norman W. King, an ex-gambler, chief of detectives. King's chief function was to invite to Minneapolis thieves, gamblers, pickpockets, confidence men, and all kinds of criminals, and arrange with them the division of the spoils of their trades. Prisoners in the city jails were let loose upon the city as an additional force of revenue collectors for the gang. The outlaws were organized into groups, according to profession, and detectives were assigned to assist and protect them. Irwin A. Gardner, a medical student in "Doc" Ames's office, was made special policeman for the sole purpose of collecting money from the common women of the town. One hundred and seven of the more decent among the 225 men on the police force were dismissed, and "Coffee John" Fitchette was made a "captain," whose sole duty was to sell places on the force. Ames and his able assistant, Gardner, "reformed" the municipal system of vice protection, diverting the monthly "fines" formerly paid by prostitutes to the city court into the mayor's own pocket. On good authority it was stated that the police officials urged criminals to rob the people, offering them protection and aid in securing victims.

Ames never was a good organizer, and, after a time, members of the official gang became jealous of each other, and the "system" began to disintegrate. In April, 1902, the grand jury met with Hovey C. Clarke as foreman. To him belongs the honor of breaking up the Ames gang. He had first to bring over the grand jury to his way of thinking. The district attorney refused to lend his aid. Mr. Clarke hired detectives at his own expense to collect evidence against the gang, and him-

self persuaded some of the "grafters" to turn State's evidence. He was offered \$28,000 to quit, and on his refusal plans were made to murder him, but he was not to be bribed or scared. As the public prosecutor was a servant of the gang rather than of the people, his first assistant, A. J. Smith, was persuaded by Mr. Clarke to take up the fight. Once in the fight, Smith did noble service, winning every case in spite of all the gang's opposition. The grand jury indicted Gardner, King, Norbeck, Fred Ames, and many lesser personages. The county had no money, so the grand jurors contributed freely to bring witnesses from other States. One important witness—a gambling dive victim—was followed from Michigan to Mexico and back to Idaho by the agent of the grand jury before they got him. The first trial of Fred Ames failed. The mayor himself was then indicted, in order to frighten the supporters of the system into some confession. The move succeeded, and on a second trial Fred Ames was convicted and sentenced to six and one-half years in the penitentiary; Norbeck was sentenced to three years, and King to three and a half years. The rottenness revealed was appalling. Two heads of departments who had escaped indictment ran away, leaving behind the evidences of their complicity in a system for defrauding the public in the sale of supplies to public institutions and the diversion of large quantities of provisions to the private residences of the mayor and other officials. Mayor Ames, under indictment and heavy bonds for extortion, conspiracy, and bribe-offering, fled to Indiana. For a time the city was without a head, until Alderman D. Percy Jones could return and exercise the duties of the mayor's office. Under his vigorous administration matters greatly improved. On November 4, a straight Republican ticket of city officials was elected except that, for mayor, James C. Haynes, Democrat, was chosen, by a majority of some 6000 over Fred. M. Powers, Republican, who was suspected of being too intimate with the gang.

St. Louis.—Bad as the conditions were in Minneapolis, those brought to light in St. Louis by the grand juries of February and October were far worse; for while the corruption in the former city sprang mainly from an alliance between the government and the smaller criminals, in St. Louis it extended further, involving men spoken of as "influential" and "respected" citizens, who had obtained franchises by bribery and preyed upon the entire community. The following account, like that of Minneapolis, is based on the investigations of Mr. Lincoln Steffens, the results of which were published in *McClure's Magazine*. Col. Edward R. Butler, an Irishman by birth and a horseshoer by trade, organized the system for blackmailing public utility corporations in St. Louis, developed it into a regular financial institution, and made it an integral part of the business community. He was at first the "boss" of the Democratic machine. Later he controlled the municipal assembly through the worst elements of both parties. He dictated nominations on both the Republican and the Democratic tickets, and secured the election of his creatures by wholesale repeating and fraudulent counting. It is said that sometimes he bought or rented the mayor, but oftener owned a two-thirds majority in each of the two houses of the municipal assembly, and could secure what he wanted without the mayor's concurrence. He demanded money from every applicant for a franchise, and only when the cash was paid down did he instruct his creatures to pass the measure through. No slightest concession, however legitimate, could be secured without heavy payments as blackmail. Every transportation and public conveyance company touching St. Louis had dealings with Butler. Citizens who asked leave to excavate in the streets for any purpose, neighborhoods that needed new street lamps or other necessary improvements, had to pay to get what they wanted. From 1898 on, wholesale bribery is said to have marked the administration of the municipal council, whose members came in time to deal with the capitalists instead of through the medium of Butler. The ensuing struggle between them for the largest share of the plunder is the most discouraging chapter in all the dismal history of municipal misgovernment in America. The Central Traction deal in 1898 was among the worst examples of bribery on record. Robert M. Snyder, a capitalist and promoter of New York, later a resident of Kansas City, asked for a franchise to lay tracks all over the city, regardless of existing tracks. The street railways of course opposed the new scheme, and finally through Butler offered \$175,000 to the municipal council for the defeat of the measure. Snyder bought individual councilmen, paying in all \$250,000, and secured the railway franchise. His next move was to sell it to his opponents, the street railway companies, for \$1,250,000. It was worth twice that amount. Councilman Frederick G. Uthoff received \$25,000 from one of Butler's creatures, and was afterwards offered \$50,000 by Snyder, but returned the bribe, saying that he could not accept it because he was already bought, at the same time intimating that he could be prevailed upon to accept \$100,000. Snyder promised this, so Uthoff voted for the franchise. Then he returned Butler's \$25,000, because, as he said to the grand jury, he "hadn't earned it." When he appealed to Snyder for the promised \$100,000, Snyder turned him off with a paltry \$500, taking by way

of receipt a signed statement that the reports of bribery were utterly false; that "I [Uthoff] know you [Snyder] to be as far above offering a bribe as I am of taking one."

In 1899 the electric lighting deal was carried through, by which Butler received \$150,000 from the company and paid out only \$85,000—\$47,500 to members of the house and \$37,500 to members of the council. At first Butler asserted that he had only \$20,000 to divide among the members of the house combine, but they suspected him of lying and hung the measure up. Meanwhile the city lay in darkness for weeks, while the blackmailing syndicate haggled about the price of the job with the incorporated bribers and franchise grabbers. Citizens who went to Mayor Ziegenhein with complaints were told by him to go to the moon for light. The furious citizens at length went with ropes to the city hall and demanded some provision for light. Under this pressure Butler weakened and promised the boodlers \$47,500, and the measure was passed. The next big measure was the Suburban Traction deal in 1899. Butler demanded \$145,000 from the St. Louis Suburban Railway Company for putting through the franchise they asked. This seemed too much, and the company got the measure through without Butler's assistance, but it cost them \$144,000, and, before the money was paid over and the company in possession of the franchise, an injunction put a stop to the job. The money was in safe deposit vaults; and a long fight for it was made. The company refused to pay over the money, because they had received no franchise; the boodlers clamored for the money because, as they claimed, it was no fault of theirs that the franchise was not delivered, inasmuch as they had fulfilled their part of the deal. It was the attempt of the blackmailers to invoke legal aid to collect the bribe money that led to their undoing.

The event which put a stop to this systematized robbery was the election of Joseph W. Folk as circuit attorney for the Fourth district. Mr. Folk refused to have any understanding with the gang, and immediately on taking office, April 9, 1901, began the prosecution of repeaters, bribers, and ward heelers of both parties, regardless of protests from the leaders of his own party. When his attention was called to a paragraph in the papers stating that a large sum of money had been placed in bank for bribing assemblymen to pass a street railway franchise, he immediately subpoenaed to appear before the grand jury nearly 100 persons, including councilmen, delegates, officers and directors of the Suburban Railway, bank presidents and cashiers, and began the most vigorous investigation that St. Louis ever experienced. Charles H. Turner, president of the Suburban Railway, and Philip Stocke, brewer and briber, turned State's evidence and told the whole story of that deal, implicating three aldermen for taking bribes and two millionaires and directors of the Suburban Railway Company for giving bribes, and two aldermen for perjury. The most discouraging feature in all this was the indifferent or positively unfriendly attitude of the "better element" toward Mr. Folk and his work. Butler himself was indicted for bribe-giving. John J. Murrell, one of the indicted assemblymen, weakened and ran away to Mexico. When Mr. Folk secured the conviction of the first boodler up for trial, the ring broke and several other prominent politicians and millionaires suddenly left the State, to return only when the crimes of which they were suspected had become outlawed by the Missouri statute of limitations. Later on Mr. Folk induced Murrell to return and tell his story, and, with the aid of this and other new evidence, he indicted all the rest of the gang, sixteen men at one stroke. The February grand jury thus characterized the members of the St. Louis house of delegates: "We found a number of these utterly illiterate and lacking in ordinary intelligence, unable to give a better reason for favoring or opposing a measure than a desire to act with the majority. In some no trace of mentality or morality could be found; in others a low order of training appeared united with a base cunning, groveling instincts, and sordid desires. Unqualified to respond to the ordinary requirements of life, they are utterly incapable of comprehending the significance of an ordinance, and are incapacitated, both by nature and training, to be the makers of laws. The choosing of such men to be legislators makes a travesty of justice, sets a premium on incompetency, and deliberately poisons the very source of the laws." Out of fifteen cases brought to trial during 1902, Mr. Folk lost but one, and that on a mere technicality. Yet all the convicts were at liberty at the end of the year. In the house of delegates three convicts, under sentences varying from two to eight years, held their seats and helped to vote down an appropriation to enable Mr. Folk to go on with his investigation. Many of his worst offenders and most valuable witnesses escaped to foreign countries. Butler himself was convicted of bribery and sentenced to three years' imprisonment; but in the 1902 campaign he dictated the nominations on both the Republican and Democratic tickets as usual, and sent his repeaters to the polling places in van-loads.

It is said that the boodlers planned to sell the Union market, and made the market-men pay \$10,000 to withdraw the scheme. They even contemplated selling the

courthouse, and gave it up only when they discovered that the ground on which this public building stands was given to the city on condition that it be used for no other purpose. Some of the boldest of the gang even conceived the brilliant idea of selling the waterworks, which are worth at least \$10,000,000, but which the hoodlums thought they could sell for \$15,000,000. It is estimated that in the four years of hoodling in St. Louis the organized thieves sold \$50,000,000 worth of franchises and other valuable municipal assets for which the city received not one cent, and they themselves got no more than one-tenth of the value. Some of the gang have said that all the possessions of the city were listed for future sale, and boasted that it would be done when Mr. Folk is out of the way.

New York City.—The cleaning up of New York City by the reform administration inaugurated on January 1, 1902, has been accompanied by none of the sensational features attending the regeneration of Minneapolis, or the exposures in St. Louis. In the metropolis, the "powers that prey" are so closely organized and have so perfected their operations that it has proved impossible to break up the "system" entirely. However, important reforms were steadily and quietly worked out, the civil service law was more efficiently carried into effect, better methods of book-keeping and accounting were introduced, and great economies were effected in all departments, by getting rid of useless employees, reducing over-large salaries, securing better employees, and stopping up the "leaks" generally, which were so conspicuous a feature under Tammany rule. The department of finance, under Comptroller Edward M. Grout, was especially active and introduced many important reforms in the management of the city's finances and especially to bring about uniformity in accounting. Bird S. Coler, when comptroller, announced publicly that the systematization of the city's accounting would save the city of New York \$25,000,000 annually. The Merchants' Association, in conjunction with the Chamber of Commerce, took up this work of reforming and systematizing the accounting of the city. At Mayor Low's instigation the assessment of real estate for purposes of taxation was raised to the full face value with the intention of increasing the city's borrowing capacity, and equalizing the burdens of taxation (see *TAXATION*). The one conspicuous failure of the reform administration was shown in the police department. It was evident throughout the year that Police Commissioner Partridge was unable to cope with the situation. Blackmail and corruption and lax enforcement of the excise law were constantly charged against the police force, and the gentle methods of the commissioner in dealing with the blackmailers and criminals on the force did not meet with general approval. The popular demand for his removal and the appointment of a younger and more vigorous man finally led to his resignation and the appointment of Gen. Francis V. Greene as his successor, taking effect January 1, 1903. The belief was current that General Greene would clean up the department and carry into visible effect the very important reforms begun under Commissioner Partridge, but which for various reasons could not be consummated under that officer. The work of the Rapid Transit Commission was of tremendous importance during 1902, in the way of systematizing and extending the underground railway system and co-ordinating it with the elevated and surface lines. The commissioner of bridges, Gustav Lindenthal, devised plans for relieving the terrible congestion of traffic at the Manhattan end of the Brooklyn Bridge during the rush hours. The street cleaning department, under the direction of J. M. Woodbury, was made very much more efficient. The Tenement House Commission did excellent service in carrying out the provisions of the tenement house law, effecting great improvements in the construction of tenement buildings, and promising still further improvements under the efficient direction of Commissioner Robert W. De Forest. The contractors and owners of cheap tenements were filled with wrath against the law, but more especially against its very efficient and impartial enforcement, and promised to exert every effort to secure the repeal of the really valuable provisions at the meeting of the legislature in January, 1903. The commission and all interested in the securing of more decent conditions in the overcrowded tenement districts of the city were preparing at the close of 1902 to make a strong open fight to preserve the present law from emasculation, and to improve it in some minor particulars. The reforms accomplished by the health department under Commissioner Lederle were spoken of by ex-Mayor Hewitt as the most "conspicuous example of municipal reform which has ever come to my knowledge." Fully 157 useless or incompetent employees were discharged and the expenses for supplies were cut down about 50 per cent, while the efficiency and scope of the work were greatly increased.

Chicago.—A few years ago the Chicago city government was a byword for corruption, but in 1902 the newspapers of the city boasted of its purity and honesty. In 1901 Chicago paid \$65,000 to a firm of expert accountants for putting the accounting system of the city into comprehensible and business-like shape, and the new system which went into effect on January 1, 1902, will, it is estimated, save \$50,000

a year to the city. Uniformity and centralization are the features of the new system. Regular forms are prescribed for all returns, and all collections and disbursements are made through the collector and the comptroller, respectively. Early in the year it became evident that the finances of Chicago were in a deplorable condition. Because of the constitutional and charter limitations upon the taxing powers of the city, revenues fell far below expenditures, and the most necessary work had to be dropped. Even the ordinary expenses of policing could not be paid, and many policemen were forced either to serve without pay, or change their occupation.

At the municipal elections held April 1, 1902, the Municipal Voters' League and the Chicago Civic Federation won a substantial victory for clean government. Most of the candidates recommended by the League were elected; four out of the eight supposedly hopeless wards were carried by the reformers; and the new council has 55 members pledged to oppose franchise grabbing and partisan scheming, while only 15 members have not given a satisfactory bond. At the same election an expression of public opinion was taken on the question of municipal ownership of public utilities and a vote of 124,000 to 19,000 was cast in favor of municipal ownership of gas and electric lighting plants, and a vote of 125,000 to 26,000 for municipal ownership and operation of street railways. There was much disagreement as to the significance of this expression of opinion. On the one hand it was said to have no meaning, because so few voters had taken enough interest in the proposition to vote upon it; on the other hand it was asserted that it had great significance because the companies possessing franchises would naturally marshal their full strength against the proposition, and the failure to secure more than 26,000 votes from a population of 1,700,000 shows a strong sentiment in favor of public ownership.

Boston.—When P. A. Collins became mayor of Boston in 1902, he ordered an investigation into the accounts of the various city departments, for the purpose of learning why the tax rate of Boston was so high. After investigation, Mr. Harvey S. Chase, public accountant and auditor, reported that the expenditures per capita of Boston were 18½ per cent. higher than of New York City and 172 per cent. higher than the average of ten other cities—Chicago, Philadelphia, St. Louis, Baltimore, Cleveland, Buffalo, Milwaukee, Providence, Indianapolis, and Kansas City, Mo. The running expenses (exclusive of permanent construction) per capita of Boston were \$34.07, or 8 per cent. above New York, and 145 per cent. in excess of the average for the ten cities. The following table gives the total itemized expenditures per capita of Boston, of New York, and of the ten cities averaged:

ITEMS.	Boston.	New York.	Average of Ten Cities.
Interest and sinking fund.....	\$8.24	\$4.30	\$2.20
Streets.....	7.21	2.52	1.48
Schools.....	7.05	6.24	3.64
Police, courts, etc.....	5.27	3.57	2.31
Sewers.....	3.00	.42	.68
Waterworks.....	2.96	2.20	1.48
Hospitals.....	2.30	1.64	.83
Fire.....	2.20	1.58	1.14
Parks and gardens.....	1.43	1.27	.57
Ferries and bridges.....	1.36	.30	.17
Municipal lighting.....	1.30	.77	.73
Garbage removal.....	1.09	.33	.33
Street cleaning and watering.....	.92	1.30	.37
Libraries, museums, etc.....	.55	.54	.17
Health, baths, cemeteries, and markets.....	.54	.35	.18
All others.....	4.41	14.81	2.62
Total.....	\$49.83	\$42.04	\$18.30

Regarding the municipal printing plant established in 1897, it was found that the plant had been running at a loss amounting in all to \$40,000. Gross inefficiency, extravagance, and dishonesty were disclosed by the investigation.

The report on the city tax collection department showed a high percentage of uncollected and practically uncollectable taxes, but revealed no dishonesty or inefficiency in the conduct of that department. The percentage of arrearages has decreased slightly since 1899. In the street department it was shown that while for the period 1895 to 1901, population had increased 15½ per cent. and wealth 21 per cent., expenditures in the divisions of the street department had increased as follows: Central office, 29 per cent.; bridges, 39 per cent.; Cambridge bridges, 44 per cent.; ferries, 14 per cent.; paving, 38 per cent.; sanitary, 36 per cent.; sewer, 20 per cent.; street cleaning, 16 per cent.; street watering, 110 per cent. M. Chase reported that the municipal ferries had been run at a total loss since 1858 of \$3,195,445.25, or an average loss of \$72,624 a year. For the past ten years the loss has been \$102,164 a year, and since 1899, \$151,288 a year. Many urged that the ferries

should be made free, in order to build up East Boston, arguing that the increase in taxes from that part of the city would more than make up the added expense of the ferries. Mr. Chase showed that, while the expense of maintaining the ferries had continually increased at a rather alarming rate, the proportion of taxes collected from East Boston continually declined; and he recommended that ferry tolls be increased so as to put the service upon a self-supporting basis. The recommendations of Mr. Chase for uniform and systematic accounting were favorably acted upon as far as possible during 1902.

Other Cities.—Advocates of municipal ownership of public service utilities in San Francisco have worked long and hard to carry their theories into practice. They succeeded in securing a new city charter which granted to the city ample powers to own and operate its own public service plants, but stipulated that to carry them into effect and secure authority to issue bonds for such purposes, a referendum vote must be taken and a two-thirds majority of all votes cast secured. At a city election held December 2, 1902, a proposition was submitted to the people asking for authority to issue \$700,000 in bonds for the purpose of equipping and operating the Gear Street Railway. There were 15,120 votes in favor of and 11,334 against the proposition. Not receiving the required two-thirds majority, the proposition was lost.

A committee of the board of aldermen of Worcester, Mass., appointed to inquire into the feasibility and expediency of a municipal electric lighting plant, after careful investigation, reported unfavorably on the scheme. The controlling reason for this decision was the higher cost of municipal service both as to original outlay and running expenses. The action of Boston, Brookline, and Springfield in renewing their contracts after investigating the question of municipal ownership had great influence with the Worcester committee. They computed the cost of light furnished by the municipal plants of the State at nearly double the contract price and figured that the cost of an arc light in Worcester would be raised from \$109.5 per year to \$168 per year. See OHIO.

MUNTZ, EUGÈNE, one of the most influential French art critics of his time, died October 30, 1902, at Paris. He was born December 16, 1845, at Soultz-sous-Forêt, Alsace. After completing his courses at the Lycée Bonaparte in Paris, and at the École du Droit, and having become licentiate, he pursued artistic researches in Germany and England. In 1873 he was appointed curator of the archaeological collections in the French school at Rome, and three years later accepted a position in the library of the École des Beaux Arts, of which he became curator in 1877. He succeeded Taine in 1885, in the chair of aesthetics and the history of art, at the Collège de France, where he lectured until 1893. In that year he was elected a member of the Academy. He was an authority especially on the art of the Middle Ages and the Renaissance, and was a most indefatigable author. He published numerous works covering almost every branch of art, which, combining the greatest accuracy and exhaustiveness with the highest erudition, are valuable to students. His *Histoire de l'Art pendant la Renaissance* (3 vols., 1888-95), which was crowned by the Academy, is magnificently illustrated, and is a compilation of material of value from every source. Among works that should be mentioned are: *Notes sur les mosaïques de l'Italie* (1874), *Les Précurseurs de la Renaissance* (1881), *Étude iconographique et archéologique sur le moyen-âge* (1887), *Tapisseries, Broderie et Dentelles* (1890), *Florence et la Toscane* (1897), *Léonard de Vinci, l'Artiste, le Penseur, le Savant* (1899). He was an officer of the Legion of Honor, and member of almost every important antiquarian society of Europe.

MUSIC in 1902. In the realm of music the year was marked by several characteristics. In the first place, cycles grew to be a fad in musical communities all over the world. The Wagner and Mozart cycles of previous years were succeeded by cycles of compositions by Verdi (Berlin, May), Tchaikowsky (Plymouth, June 28-29), Bunge (Dresden), Bruckner (March 23—biennially at Linz, at communal expense), and even Donizetti (Zurich, October). Secondly, there was a notable change of attitude, especially among certain English-speaking critics, toward Richard Strauss, a change brought about apparently by reasoning that Wagner, too, was once misunderstood. The works of Bruckner, almost neglected until lately, came into great prominence during 1902; hardly an important musical community omitted to perform at least one of his works. Among the works of continued and growing popularity of former years, the works of Tchaikowsky in the concert domain, and Charpentier's *Louise* in the field of opera, made progress still further. Upon its production in various German cities, *Louise* met with an invariable success both with the critics and the public and ran into scores of performances in several opera houses. It required little keenness of observation to state a decided tendency among composers, critics, and public alike, away from the mythological music dramas toward the rounded forms resting on an up-to-date orchestration and more or less well-knit libretto. On these lines were built *Der Richter von Zalamea*, by

Georg Jarns, and d'Albert's successful *Improvisator*, comic opera based on Hugo's *Angelo, the Tyrant of Padua*, and leaning to the methods of Verdi's *Falstaff*; while Strauss's *Feuersnot*, Bungert's *Nausikaa* (Hamburg, February 20), Weingartner's *Orestes* (Leipzig, February 15), Kienzl's *Heilmars* (Berlin, January 28), and Dluski's *Urwasi* (Lemberg, February), were all failures.

Novelties.—Mahler's Fifth Symphony in D minor, with chorus and alto solo, had an extraordinary success at Magdeburg late in the autumn. The First Symphony of Emil Abrámi (nineteen years old) was praised as a magnificent first work, exhibiting a wealth of ideas, passion and originality, but a lack of symmetry and reserve. Sibelius's Second Symphony in D major was set down as a splendid achievement, masterly in subject matter and treatment, less Finnish than his former works, though suggestive of Tchaikowsky. Some praise was also given Hans Huber's Third Symphony in C at Basel, while Shilling's symphonic fantasia, *Meergruss*, was found too hazy, vague, and monotonous, in Germany. Busoni's Second Violin Sonata was considered one of the most important recent works, and the same judgment was passed upon Schratzenholz's String Quartette in B minor, performed by the Joachim forces at Berlin in the spring. Its melody and wealth of ideas were highly commended. In the nature of a novelty, also, appeared Bach's Concerto for four pianos and string orchestra, given under Stavenhagen at Munich. It is really an arrangement of Vivaldi's Concerto for four violins, and presents the Leipzig cantor in his happiest vein. In the field of opera Claude Debussy's comic opera in five acts, *Pelléas et Mélisande*, was hailed at Paris as opening new paths, and Massenet's *Le Jongleur de Notre-Dame* (based on an ancient miracle-play), was pronounced his masterpiece, at Monte Carlo (in January). *La Troupe Jolicoeur*, a comic opera in three acts and prologue by Arthur Coquard, won very favorable opinions at the Opéra Comique, Paris. Saint-Saens's *Parysatis*, in three acts (Béziers, August 17) did not add to his laurels, and *Orsola*, by the brothers Hillemacher, which had awaited a performance for a quarter of a century, did not display any just claims for production. Of the two chief Italian novelties, Franchetti's *Germania* (La Scala, March 8) and Giacomo Orefice's *Cecilia* (Vicenza, August 16), the latter quite stirred up the connoisseurs. Pedrell's *Los Pireneos* (Barcelona, January) is the most imposing work ever written by a Spaniard—making splendid use of ancient religious and Oriental music. Of the German works several have been mentioned above. The unfortunate Hugo Wolf's *Corregidor* (Prague, May) won the highest praise, though Carl Weiss's *Der Polnische Jude* had the greatest success, making the rounds of the German operatic stage. Reznicek's *Till Eulenspiegel*, "volksoper" in two parts and a postlude, given at Karlsruhe (January 12), achieved a brilliant success. It is a folk-opera in the best sense of the word, tuneful, vivacious, facile. Leo Blech's "village-idyll," *Das war Ich* (Dresden), is a happy achievement in the new genre of "conversation-opera" of which d'Albert's *Abreise* has been the best specimen. Humperdinck's *Dornröschen* (Frankfort-on-the-Main, November) brought forth the general advice to tread back to the path of *Hänsel and Gretel*. It is a case of *parturiunt montes* in orchestration and *ridiculus mus* in motives, except where folk-songs are employed. Schilling's "merry opera," *Der Pfeifertag* (Berlin, September 17); Hubay's *Der Dornlumpf* (Charlottenburg), and Stolzner's "Märchenoper" *Rübezahl* (Dresden, June 14) fell through dismally. The last work, sentimental and dull, had only piquant rhythms in its favor, while the sole redeeming feature in Hubay's work was a violin solo played by himself. In Russia, Taneyeff's *Amour's Revenge*, in one act, proved a virtuoso achievement in writing melodious, graceful, often captivating music in the style of the libretto's epoch (Louis XIII.); Rimsky-Korsakoff's *Servilia* (time of Nero) did not come up to his operas on national subjects, and Napravnik's *Francesca* had a *succes d'estime*—all three produced at St. Petersburg; while at Warsaw Noskowski's *Livia Quintilia* was hailed with delight on April 19. François Thomé's incidental music to Anatole France's *Marriage de Corinthe* was pronounced the best of its kind since Massenet's *Phèdre* music, and Mascagni's music for *The Eternal City* (October 3, London) delighted numerous theatregoers. In choral works Felix Woyrsch's *Passion-Oratorio*, really belonging to a previous year, was given throughout Germany in 1902 with much success. It is "in its way a monumental work of church music of our times," "the nearest approach to Bach's masterpieces." *Loreley*, a Rhine-legend in four parts for solos, chorus, and orchestra, by Adolf Stierlin, was given successfully three times in two weeks at Münster.

Revivals and Local Novelties.—Of the older compositions Mozart's sparkling *Schauspielführer* delighted the audience, while Gluck's pastoral *Maienkönigin* fell flat, at their revival at Munich in February, 1902. Handel's oratorio *Alexander Balus* was produced by the Handel Society of London on February 19, and his *Acis and Galatea* had to be repeated several times in March, before crowded houses. Méhul's *Joseph in Egypt* was a great success at both Munich and Düsseldorf in the spring, and his comic opera *L'Irato* was equally well received at Brussels after rest-

ing since 1823. C. Villiers Stanford's *Much Ado About Nothing*, produced at Leipzig (April 25), was found lacking invention and missing the right mood. *Siegfried* with Jean de Reszke as the hero had 18 performances at Paris early in the year, and had its initial production in St. Petersburg about the same time; as also had *Götterdämmerung* in the fall, while *Die Walküre* was introduced to the Moscow public. At the first performance of *Rheingold* in Nice the listeners "were astounded but not edified," and in March Lisbon heard *Die Meistersinger* for the first time. Charpentier's *Louise* was given its first hearing in most of the German and Austrian opera houses, and Tschaikowsky's *Iolanthe*, *Dame de Pique*, and *Eugène Onyguin* were successfully produced in several European music centres. The reprise of Lalo's *Roi d'Ys* at the Paris Opéra Comique after 14 years was a genuine triumph for the work, so glowing in color, rare in instrumentation, magnificent in its vocal parts as well as in its symphonic music. A second-rate French opera company revived Gounod's *Mireille* and Massé's *Galathée* at Berlin in April.

Deaths, Anniversaries, and Jubilees.—The necrology list for 1902 included the great theoretician Jadassohn (Leipzig, February 1); Marchetti, the composer of *Ruy Blas* and president of the St. Cecilia of Rome (in January); the Wagnerian singer Paul Bulss (March 21); the matchless original Aida, Teresina Stoltz, who died at 62; and the composer, Franz Wullner (September 7).

The one-hundredth anniversary of Haydn's *The Seasons* was celebrated at Münster (April 24, 1902); the six hundredth performance of *Don Giovanni* occurred at Berlin (June 20); and of *Freischütz* at Dresden; the four-hundredth representation of *Fidelio* was given December 17, and the two-hundredth of *Scraglio* April 17, both at Berlin. The Laibach Philharmonic Society celebrated its two-hundredth anniversary, and the St. Petersburg Philharmonic completed a century of existence, both being the oldest in their countries. A Verdi bust by Quadrelli was erected at the Milan cemetery (January 27, anniversary of the maestro's death) and a monument to Liszt was unveiled at Weimar on May 31. Among the living, Charles Lecocq passed his 70th birthday; Massenet, so aptly designated "Mam'selle Wagner," celebrated his 60th anniversary on May 12; Boito, the composer of the often-promised *Nerone* ("the greatest opera ever written," according to Verdi) completed his three-score years on February 24; and Ernest von Schuch's thirty years of conductorship were worthily commemorated at Dresden on March 16 by a production of *Don Pasquale*, the opera at which he had first tried his hand.

Festivals.—The 179th meeting of the Three Choirs took place at Worcester (September, 1902), with Ivor Atkins as conductor. The novelties, Granville Bantock's orchestral poem, *The Witch of Atlas*, H. Walter Davies's oratorio, *The Temple*, and Hugh Blair's cantata, *The Song of Deborah and Barak*, were completely overshadowed by Elgar's *Dream of Gerontius*. The Sheffield Triennial (October 1-3) was directed by Henry J. Wood. Elgar's *Coronation Ode* for soloists, chorus, and orchestra, presented rather more genuine merit than a mere *pièce d'occasion*, while Coleridge-Taylor's short cantata, *Meg Blanc*, and Coward's dramatic cantata, *Gareth and Lynet*, were of the ordinary festival novelty calibre. At the Norwich Festival, beginning October 21, eight concerts were given under A. Randegger and Dr. A. H. Mann. Of the nine novelties, MacKenzie's suite *London Day by Day* evidently owed its origin to the success of Elgar's *Cockayne* overture. A. Randegger, Jr.'s dramatic cantata, *Werther's Shadow*, was manifestly none other than the opera produced in Italy as *Ombra di Werther* several years before. C. Villiers Stanford's spirited *Irish Rhapsody* for orchestra, Horatio Parker's cantata *A Star Song*, and Cowen's *Coronation Ode* were the other more important novelties. At Bristol (October 8-11) Elgar's *Ode* and *Concert-Overture*, Coleridge-Taylor's *Hiawatha* scenes, and Parker's *Legend of St. Christopher* were the novelties, Parker's composition winning considerable success. The chorus numbered 350 voices. The five concerts of the annual London Musical Festival (beginning April 28, at Queen's Hall) were conducted by Wood, Ysayé, Nikisch, Saint Saëns, and Weingartner successively. In the United States, the forty-fifth annual Worcester (Mass.) Musical Festival was conducted by Wallace Goodrich and Kneisel (September 30-October 4) the divided leadership proving an admirable innovation. The chorus numbered 400 and the orchestra 65 musicians from the Boston Symphony forces. Among the works produced, a part of Bach's *Christmas Oratorio*, Parker's *Hora Novissima*, and Chadwick's *Judith* commanded the greatest attention. F. S. Converse's splendid *Romance* for orchestra, a *Tone-poem* by Loeffler, G. Fauré's *Birth of Venus*, an air by Charpentier, and an excerpt from Strauss's *Feuersnoth* were the novelties. A splendid array of artists was employed, but the festival ended in a serious deficit. The Cincinnati Music Festival, held in May, consisted of five concerts, at which the great masterpieces Bach's *Mass in B minor*, Beethoven's *Eroica*, and César Franck's *Les Béatitudes* received particularly inspiring interpretations under Theodore Thomas, aided by an orchestra of 200 and a chorus of 500 voices. The Brooklyn Music Festival was held by the local Arion on November 27-29. In Germany the

thirty-eighth *Tonkünstler-Versammlung des Allgemeinen deutschen Musikvereins* took place on June 7-10 at Frefeld. At one of its six concerts Mahler's 3rd Symphony was the attraction. At the seventy-ninth *Niederrheinisches Musikfest* (May 18-20) at Dusseldorf, Elgar's *Dream of Gerontius* was proclaimed a masterpiece by everybody. The Bayreuth Festival began on July 22 and embraced 20 performances: *Parsifal* 7, *Der fliegende Holländer* 5, and the *Nibelungenring* 2 each. The performances, under Richter, Mottl, and Muck were an improvement over those of the previous year. The 20 festival performances of *Tannhäuser* (4), *Lohengrin* (4), *Tristan* (5), and *Meistersinger* (7) at the Munich Prinz-Regententheater (August 9-September 12) surpassed even those of the year before. A few alterations turned it into one of the most perfect theatres acoustically. The *Festival Lyrique* at Paris of Wagner performances under the baton of the young pianist Cortot, was a success in every way. Litvinne's Brunnhilde, Van Dyck's Tristan, Dalmore's Siegfried, and the Waltraute of a Russian contralto Melgoonova won particular praise.

THE UNITED STATES.

Artists.—As usual a plethora of foreign artists came to the United States in 1902. Paderewski, as performer and composer of *Manru*, attracted as much attention as ever. Pugno returned in the fall to delight lovers of virile, well-balanced interpretations of the great masters of the keyboard. Nothing sensational, but a warm devotion to the highest ideals, is what his playing presents. Gabrilowitsch brought back the same idiosyncracies, a more advanced technique, a riper musicianship and more virility. The Scotch pianist Frederick Lamond gradually won recognition as an excellent interpreter of the classics, though somewhat lacking in the kind of temperament that appeals to the many. Arthur Hochman, a New York youth with Berlin schooling, won unstinted praise as the most promising pianist of equal age. Hambourg, remarkable in speed, power, and endurance, thrilled his audiences in Tschaikowsky's Concerto, and sang more melodiously than ever in Chopin, Schubert, and Schumann. Arthur Whiting continued pioneer work for his own compositions. Among the violinists Kocian did not gain the same favor in the autumn as Kubelik had won in the winter and spring. He revealed a sweet, feminine temperament, an astonishing but not impeccable technique, a lack of aplomb and a more promising (though crude) gift of interpretation than Kubelik could boast. The nine-year-old Florizel von Reuter had the endowments and the inevitable crudities of a child prodigy. Maud McCarthy proved too immature for public appearances. Elsa Ruegger displayed more interpretative ripeness, masculine power in bowing, and digital dexterity in handling the 'cello than on her former visit. In vocal concerts, Marcella Sembrich drew large audiences, though decidedly on the decline vocally; Lilli Lehmann, equally poor in voice, continued as a great favorite in her recitals, and Calvé gave a song recital (March 17) bizarre in its intermingling of old and modern songs and unique in its application of stage methods to concert singing. In Mary Munchoff the public discovered a delicate art and lovely voice, a charming personality, a rare versatility in interpretation within her vocal limitations. The basso Herbert Witherspoon won high praise for a well-schooled voice of fine quality and great range of expression.

Musical Organizations.—The Boston Symphony Orchestra supplied the best music performed in a well-nigh perfect way; The Philharmonic, under the new leader—Walter Damrosch—struggled with the inveterate faults of its "old guard;" the Philadelphia Orchestra and the Pittsburgh Orchestra showed more promising material than was in the New York Philharmonic; the People's Symphony Concerts in New York brought pleasure to numerous working people on the East Side, and F. Damrosch's Young People's Symphony Concerts kept up their reputation of a splendid "preparatory school" for the appreciation of the best in music. Franko's small orchestra still dispensed the "forgotten beauties" of old masterpieces. A series of orchestral concerts given by the young Wetzler proved a most welcome factor in the musical life of New York; frequent rehearsals, definite individual ideas as to the meaning of the composer, clear-cut outlines, and a vigorous baton, all combined to produce some of the most memorable though technically not the most perfect renderings of the great standbys of the concert stage. The Musical Art Society produced Bach's *A Stronghold Sure*, the People's Choral Union gave an excellent performance of Handel's *Israel in Egypt*, and the Oratorio Society its usual *Messiah* in Prout's unimportant revision, besides Schumann's *Paradise and the Peri*. In chamber music the Kneisel Quartet remained *hors de concours*, and the Mannes Quartet was organized in New York. In the summer, Kaltenborn's Orchestra in New York found a successful rival in the brass-band of the sensational Duss.

Opera.—The novelties were Mascagni's short *Zanetto*, beginning with the subdued warmth of a Provençal idyll, and his *Iris*, the prologue to which, depicting in a wonderful crescendo of glowing orchestral color, the rising of the sun, was one of the most thrilling and imposing pieces of music of its kind heard in New York in

some time. Mascagni's conducting of *Cavalleria* was excellent. His company—efficient singers with small reputations—broke up after eleven weeks of touring. De Lara's *Messaline*, frankly reminiscent of other operas, though here and there genuinely original and strong, was condemned by "guardians of public morality" from among the musical critics on account of its subject. In it Calvé—now imperious, now plaintive—displayed all her wonderful resources of singing and acting. Paderewski's *Manru* was given before a full house. Sembrich appeared in *Manru*, *La Bohème* and *La Fille du Régiment*. De Marchis was favorably received in *Aida*, *Tosca*, *Traviata*, and *La Bohème*. Alvarez and Scotti enhanced their reputations by their performances in *Otello* and *Messaline*; Scotti also in *Nozze di Figaro*, *Rigoletto*, and *Traviata*. Eames was unable to excel Ternina as *Tosca*. The German tenors, Bandrowski (especially engaged for *Manru*), Anthes and Gerhäuser, did not justify the *casus belli* with which their opera houses threatened the new world for their departure. Bispham's Iago was Telramund in Venetian clothes—overacted and disclosing the "acting" at all times. In Kirkby Lunn a possessor of a magnificent contralto was found with some good routine acting and quite satisfactory singing.

In the United States the operas of the calendar year 1902 were as follows: *Carmen*, *Aida* (8 times each); *Lohengrin* (7 times); *Otello*, *Tosca* (6 times each); *Tannhäuser* (5 times), *Cavalleria Rusticana*, *Faust*, *Les Huguenots*, *Traviata* (4 times each); *Nozze di Figaro*, *Flauto Magico*, *Die Walküre*, *Messaline*, *Manru*, *La Fille du Régiment* (3 times each); *Barbier de Sévigné*, *Tristan und Isolde*, *Le Prophète*, *Le Cid* (twice each); and one performance each of *Das Rheingold*, *Siegfried*, *Götterdämmerung*, *Die Meistersinger*, *Pagliacci*, *Roméo et Juliette*, *La Bohème* and *Rigoletto*, or 90 performances of 28 operas, giving 8 Wagner operas 21 times, and 4 Verdi operas 19 times. In the spring French opera-bouffe was given by a second-rate company. In September the Bostonians ran *Robin Hood* to the capacity of the Academy of Music (New York) for 4 weeks.

England.—There were six evening concerts by the Joachim Quartet; performances early in the year by the famous Bohemian Quartet; 10 Saturday popular concerts under Johann Kruse (formerly of the Joachim Quartet); 3 concerts at St. James's Hall by Hans Richter (in November); 5 concerts by the Meiningen Orchestra (under Fritz Steinbach), beginning November 17, and distinguished for the interpretation of the works of Brahms. Of the home organizations, the Philharmonic gave its ninetieth season very successfully, and Robert Newman's Orchestra of Queen's Hall resumed the Promenade Concerts under Henry J. Wood (September-November), and continued the Symphony Concerts.

Among the visiting artists Joachim, Ysayé Kocian, Kubelik, the youthful Philadelphia Arthur Hartmann, Kreisler, Busoni, Pachmann, Paderewski, Sapellnikoff, Borwick, and Dohnányi were the most distinguished.

The opera season (May 8-July 28) embraced 70 performances of 21 operas, with two cycles of Wagner's *Ring*. There were two innocuous novelties: Miss E. M. Smyth's *Der Wald*, an impotent attempt at a blending of the pastoral with latter-day realism, and Herbert Bunning's *La Princesse Osra*, based on a story by Anthony Hope. *Elisire D'Amore* was welcomed with delight at its revival, introducing as it did the young colorature soprano Regina Pacini and the tenor Caruso, a successful claimant for the place of Masini. In the older repertoire (*Lucia*, *Rigoletto*) as well as in *Aida* and *Bohème* he shone with equal splendor. Nature has produced in this artist an uniquely harmonious blending of voice, technique, temperament, interpretation, and physique. The other singers were Calvé, Melba, Nordica, Mary Garden, Lohse, Scheff, Kirkby-Lunn, and Fremstad; Van Dyck, Kraus, Saléza, Maréchal, Salignac, Pennarini, Scotti, Renaud, Van Rooy, Bispham, Seveilhac, Pini-Corsi, Blass, and Plançon. In September the Moody-Manners forces gave English opera at a financial deficit, though with success artistically. Among the operas were *Trovatore*, *Faust*, *Lohengrin*, *Tannhäuser*, *Tristan und Isolde*, *Pagliacci* and *Cavalleria Rusticana*. Brozel, Coates, O'Mara, Manners, Fanny Moody, De Lussan, Alice Esty, and Marchesi were the chief artists. Emilio Pizzi's tragic *Rosalba* in one act was the novelty (September 26).

NAST, THOMAS, an American cartoonist, died in Guayaquil, Ecuador, December 7, 1902. He was born in Landau, Bavaria, September 24, 1840, and when six years old was brought by his parents to the United States. As a boy of fourteen, with little training in art work, he began to furnish drawings for *Frank Leslie's Illustrated Newspaper*, and in 1860 went to Europe as a special artist for the *New York Illustrated News*, to make sketches of the prize fight between Heenan and Sayers, which aroused considerable public interest. Following this, he accompanied Garibaldi's armies, sketching for *The Illustrated London News*, *Le Monde Illustré*, and other papers in Europe and America, and often performing important diplomatic missions for the Italian patriot. The Civil War broke out soon after his return to the United States, and as a member of the staff of *Harper's Weekly* he began to produce the

war pictures, such as his famous "Peace" (1862), which gained for him a national reputation, and which were powerful influences upon public sentiment. After the war he turned his attention to political cartooning, and until his withdrawal from active work in 1887, through the ridicule and satire of his drawings he was the most feared of all newspaper cartoonists. His grotesque sketches describing the Greeley-Grant, Hayes-Tilden, and Blaine-Cleveland presidential campaigns were known throughout the United States, and his caricatures of Tweed and his accomplices were the potent influences in exposing the malfeasance of that notorious "ring." At first depicting only general situations, he gradually introduced individual caricature, displaying at all times a keen sense of political conditions and a remarkable power of invention. The elephant, donkey, and tiger, which are now the familiar symbols respectively of the Republican and Democratic parties and of Tammany Hall in New York City, were first pictured by him; and others of the political signs and names that now prevail were of his creation. His formal art education was confined to youthful study in the drawing classes of Theodore Kaufmann, but the realism and execution of his sketches earned for him description as the "American Hogarth." He possessed great skill in drawing likenesses. It was one of his portraits that led to the arrest of Tweed while a fugitive from justice in Madrid, though the crime pictured in the cartoon, which represented its subject holding aloft two of his confederates, was interpreted as kidnapping by the gendarme who made the fortunate capture. Nast's later activity was confined to book illustration and to giving lectures, which he illustrated by rapid and clever sketches while talking. At various times he worked in oils, and his paintings, "Lincoln's Visit to Richmond," "Saving the Flag," "The March Through Georgia," and "Departure of the Seventh Regiment," were much admired; but he was by nature and achievement pre-eminently a cartoonist. On May 1, 1902, he was appointed to succeed Perry M. de Leon as consul-general at Guayaquil. Here he succumbed to yellow fever.

NATAL, a colony of Great Britain in South Africa, on the Indian Ocean, bounded by Cape Colony, Basutoland, the Orange River Colony, and the Transvaal. The area, including the province of Zululand and the district annexed from the Transvaal in 1902 (see paragraph History) is 36,434 square miles, and the population about 993,000, of whom 850,000 are Zulus, 73,000 Europeans, and 70,000 East Indians. The capital is Pietermaritzburg, population (1900), 28,500, and the largest town and only seaport, Durban, population (1900), 48,410. The government maintains separate schools for Europeans, natives, and Indians, the enrollment in each being (1900) 10,511, 10,618, and 2895 respectively, exclusive of 1600 children attending private unaided schools.

Government and Finance.—The executive power is vested in a governor, assisted by a responsible ministry of six members appointed by himself. The legislative authority rests with a legislative council, appointed by the governor with the advice of the ministry for a term of ten years, and a legislative assembly of 39 members, elected on a limited suffrage for four years. The present governor is Sir Henry Edward McCallum appointed in 1901, and the premier since June, 1899, has been Sir Albert H. Hime. Colonial defense has, up to 1902, been provided by a force of mounted police and a naval defense corps, but after the conclusion of the Boer war the colony was made a separate command, with an establishment comprising infantry, cavalry, and artillery. The Natal volunteer force that served in the war numbered 148 officers and 2054 men, and their losses amounted to 8 officers and 122 men. The estimated cost of the war to the colony up to August 31, 1902, was £1,067,391. The colonial revenue for 1901 amounted to £2,970,742, as compared with £1,886,710 in 1900, and the expenditure in the same time increased from £1,990,522 to £2,480,932, leaving a surplus of £489,810. The colonial debt increased from £9,019,143 in 1900 to £10,574,143 in 1901. The revenue estimates for 1902 were placed at £3,400,000, with an estimated surplus of £316,000, the increase being accounted for by the great growth in the customs revenue.

Industries, Commerce, etc.—The great variety in the soil and climate of Natal results in an unusual diversity of products. The low region along the coast, with an almost tropical climate, produces sugar, coffee, arrowroot, ginger, tobacco, tea, and fruits. Tea planting only recently introduced, is increasing rapidly, the yield for 1900 being 1,679,600 pounds. In the same year the sugar production, the principal export crop, amounted to 333,768 cwt. In the midland region the acreage of cereal crops is being annually extended. In the highlands, sheep-farming and the raising of other kinds of live stock is the principal occupation of the inhabitants, and wool, hides, and skins and angora hair are produced for export. The coal fields, which are of large extent, are now connected with Durban by rail, and the increase of transportation facilities has brought about a corresponding increase in the output which amounted in 1898 to 387,811 tons, and in 1901 to 569,200 tons. The trade is largely with Great Britain, and shows a steady increase in spite of the depressing conditions resulting from the war. The imports, principally clothing, food-stuffs, and machinery

amounted in 1900 to £5,911,518, and in 1901 to £9,822,686, and the exports, which in 1900 amounted to only £1,134,172, reached a value of £4,268,817 in 1901. The values of the principal exports in 1901 were coal, £419,726; wool, £253,938; sugar, £113,041; bark, £59,850; and hides and skins, £49,850.

Communications.—There were, in 1902, 626 miles of railway open, almost all of which is owned and worked by the government. The main line extends 306 miles inland from Durban, via Pietermaritzburg, to Charlestown on the Transvaal border, the branch lines adding as much again to the mileage of the system. During July, 1902, the Zululand branch (53 miles in length) from the Lower Tugela to the St. Lucia gold fields, was opened for traffic. Work is in progress on a new connection, with the Cape Colony system, with which it will effect a junction at Riverside, on the Griqualand East boundary. The construction of an alternate trunk line through Natal, or the doubling of the existing main line to improve transportation facilities with the Transvaal, was proposed during 1902 and caused considerable political friction (see following paragraph).

History.—At the opening of the parliament on February 27, 1902, the governor, Sir Henry McCallum, spoke of two matters which proved of considerable importance. One was the proposed extension of the colony's boundaries, the other, the extension and improvement of the state railway system. In regard to the extension of the colonial boundaries by the inclusion of territory belonging to the former South African Republic nothing had been done at the time, but the governor's suggestion was quickly acted upon. On April 30, it was announced that the British government had consented to the extension, and on May 12 the annexation bill, providing for the transfer, was passed by the legislative assembly. The annexed district comprised Vryheid, Utrecht, and that portion of Wakkerstroom lying on the Natal side of the Drakensburg, and had an aggregate area of about 7000 square miles and an estimated population of 8000 Europeans and 50,000 natives. One of the conditions of the transfer provided for Natal's assuming a portion of the Transvaal debt, amounting to about £700,000. In July a commission consisting of representatives of Natal, the Transvaal, and the Imperial government, was appointed to determine the exact boundary of the annexed region. The agitation of the question of railway improvement or extension, brought out the fact that radical differences of opinion existed in the colony in regard to it. The necessity of increased railway facilities was accepted universally, and there was general acquiescence in the proposition to issue additional bonds to the amount of £5,000,000 for the construction. The difference of opinion manifested itself in proposals for the route. The government proposal is for doubling the present main line from Durban to Ladysmith. The proposal of the opposition is for the construction of a more direct line from Durban to Waschbank, just below Glencoe Junction, and they assert in its favor that it would open up a new part of the country not hitherto possessing railway facilities. A third proposition has been tentatively advanced for a line from Umlatoosi through Zululand, and the newly acquired territory to Ermelo, joining an eventual line from the Rand to Delagoa Bay. The railroad question proved to be the main issue at the elections of December 19, which resulted in the choice of 20 Ministerial and 19 Opposition members. Since the government had secured a majority of only one, and since from its membership the speaker is elected, the strength of the two parties in the legislative assembly was exactly equal. At the end of the year it seemed probable that a compromise would be effected, possibly accompanied by a partial reconstruction of the ministry. At a special session of the Natal legislature in November martial law was repealed, and a martial law indemnity bill passed. On December 30, 1902, Mr. Joseph Chamberlain, the British colonial secretary, announced at Pietermaritzburg that the Natal government had decided to forego their war claims against the imperial government, aggregating nearly £2,000,000, and that this sum would be considered Natal's contribution to the war.

NATIONAL ACADEMY OF SCIENCES. See ZOOLOGICAL SOCIETIES.

NATIONAL BANKS. The effect of the act of March 14, 1900, authorizing the organization of national banks with a capital of \$25,000 in places having a population not exceeding 30,000, has been to increase greatly the number of such banks. From the date of the passage of that act to October 31, 1902, there were organized 805 associations with a capital of less than \$50,000 and a total capitalization of \$21,099,500. One of these banks was placed in charge of a receiver, and thirteen in voluntary liquidation, leaving 791 in active operation. Of this whole number 302, with a capitalization of \$7,905,000 were formed during the year ending October 31, 1902. The largest number of small banks formed under this act were organized in the Middle States. These numbered 246 with a total capitalization of \$6,485,000. The Western States ranked next, with 228 banks organized with a total capital of \$5,850,000, while the Southern States came next with 196 banks organized with a total capital of \$5,255,500. In the Eastern States 109 banks were organized with a total capital of \$2,839,000; in the Pacific States 21 banks, with \$545,000

capital, and in the New England States only five banks were organized, having a total capital of only \$125,000. The States organizing the greatest number of small banks under the act of March 14, 1900, are: Texas, 112 banks, capital, \$3,023,000;

Minnesota, 62 banks, capital, \$1,570,000; Pennsylvania, 61 banks, capital, \$1,582,000; Oklahoma, 53 banks, capital, \$1,340,000; Iowa and Illinois, 49 each, capital, \$1,300,000 each; Indian Territory, 43 banks, capital, \$1,135,000. Of banks having a capital of \$50,000 or over, 407, with a total capitalization of \$49,060,000, were organized in the period from March 14, 1900, to October 31, 1902.

For other banks in the United States, see TRUST AND LOAN COMPANIES; PRIVATE BANKS; SAVINGS BANKS; and STATE BANKS; see also BANKS—BANKING.

NATIONAL EDUCATIONAL ASSOCIATION. See EDUCATIONAL ASSOCIATION, NATIONAL.

NATURAL GAS. The value of the natural gas produced in the United States in 1901 was \$27,067,500, an increase of \$3,368,826 over 1900. Important new developments were reported in West Virginia in Lewis, Harrison, Marion, Monongalia, and Wetzel counties, where wells sunk to depths of 3000 feet opened some very large reservoirs, yielding a daily output of from 10,000,000 to 15,000,000 cubic feet. This State is expected to make up for the decreased production in Ohio and Pennsylvania, and it is already supplying large quantities of gas to towns outside of its borders. Southeastern Kansas nearly doubled its output. Pockets of natural gas under enormous pressure were opened in the drilling of oil wells at Beaumont, Tex., but they gave no large flow. The gas was used chiefly to force the petroleum to the surface.

NAVAL ACADEMY, UNITED STATES, Annapolis, Md., established 1845. During 1901-02 the students numbered 407, and the instructors 69. There were 43,000 volumes in the library. The new armory was completed during 1902, and other buildings were in process of construction. The new academy, the appropriations for which amount to about \$10,000,000, will require about five years for completion. The department of languages introduced the phonograph as a means of instruction in pronunciation with very successful results. The superintendent is Capt. W. H. Brownson, appointed November 6, 1902.

NAVAL DEVELOPMENT. During the year 1902 additions to the naval strength of the various powers of the world were carefully considered, the existing programmes being carried out and plans made for a large number of new vessels. The strength of the principal navies, including the number and displacement of

N. B.—Vessels launched before 1878, unless reconstructed and re-armed, are not included in these lists. Unprotected cruisers and gunboats do not include converted merchant vessels or yachts.

vessels of different classes, is shown in the accompanying table prepared by the office of naval intelligence of the United States Navy Department. It will be seen that Great Britain leads not only in the number of vessels but also in tonnage, followed by France. The United States comes next with a greater tonnage but fewer vessels than Russia, Germany, and Italy. These countries, with Japan and Austria-Hungary, make up the principal naval powers of the world.

NAVAL MANŒUVRES. See MANŒUVRES, MILITARY AND NAVAL.

NEBRASKA, a central western State of the United States, has an area of 77,510 square miles. The capital is Lincoln. Nebraska was organized as a Territory May 30, 1854, and admitted as a State March 1, 1867. The population in 1900 was 1,066,300, and in June, 1902, as estimated by the government actuary, 1,068,000. In 1900 the populations of the three largest cities were: Omaha, 102,555; Lincoln, 40,169; South Omaha, 26,001.

Finance.—The balance in the treasury at the beginning of the biennial term ending November 29, 1902, was \$615,018.34. The total receipts during the term were \$6,742,551.71 and the disbursements, \$6,925,314.67, leaving a balance on hand, November 29, 1902, of \$432,255.38. Of the receipts, \$2,139,332.36 were on account of the general funds; \$2,403,954.09 on account of the permanent school fund; \$1,346,975.99 on account of the temporary school fund; and \$426,841.23 on account of the temporary university fund. Of the amount derived from the general fund, \$1,797,022.26 were from the collection of State taxes. At the end of the biennial term the trust funds, school, university, etc., held, as investments, bonds and warrants to the amount of \$5,456,977.90. At the same time, the floating indebtedness of the State, created by making appropriations larger than the amount collectible from the State levy was \$1,989,328.63, of which the educational trust funds held \$1,457,351.56. The investment of the educational trust funds was stated by the treasurer to present a perplexing problem, as under existing constitutional limitations municipal bonds and school district bonds could not be paid.

Agriculture, etc.—According to the *Crop Reporter*, the leading crops of Nebraska for 1902 were: Corn, 7,817,962 acres, 252,520,173 bushels, value, \$75,756,052; winter wheat, 1,895,362 acres, 43,972,398 bushels, \$21,546,475; spring wheat, 629,788 acres, 874,053 bushels, \$4,289,486; oats, 1,795,422 acres, 62,121,601 bushels, \$15,530,400; rye, 160,139 acres, 3,250,822 bushels, \$1,170,296; potatoes, 82,244 acres, 11,267,428 bushels, \$3,042,206; hay, 556,398 acres, 968,133 tons, \$4,221,060. The farm animals in the State January 1, 1903, comprised 772,231 horses, worth \$42,083,085; 47,659 mules, \$3,214,225; 618,894 milch cows, \$17,533,267; 2,403,999 other cattle, \$47,384,737; 536,239 sheep, \$1,481,950; and 2,889,133 swine, \$25,222,131. Nebraska ranked third in the raising of swine and fourth in cattle raising.

The Omaha stock market in 1902 did the largest business in its history. Cattle receipts in 1902 were 1,010,000; in 1901, 810,000. South Omaha as a sheep market was second only to Chicago. Receipts in 1902 were 1,325,000—an increase of 430,000 over 1901. Receipts of hogs amounted only to 2,250,000, on account of the short corn supply, as against the record figure of 2,460,000 in 1901. In 1902 the Omaha Packing Company added a million-dollar beef plant to its already large investment. Omaha bank clearings increased from \$334,102,066 in 1901 to \$362,607,657 in 1902.

Conventions and Platforms.—The Republican State Convention was held at Lincoln on June 18, 1902. The President's policy was indorsed in the platform, especially with reference to Cuban reciprocity and the trusts. In State matters, a revision of the constitution was called for, and a demand was made for stricter enforcement of the laws regarding taxation and assessment. The passage of a law levying a tax upon the gross premiums of life and accident insurance companies was urged.

The Democrats and Populists held conventions at Grand Island on June 24, 1902. They united on a single ticket, nominating three Democrats and four Populists. William J. Bryan was nominated for governor by the Populists, but refused the nomination. The Democratic platform reaffirmed the Kansas City platform of 1900; declared the Republican party to be under control of the trusts; approved the attitude of Democrats in Congress regarding the Philippine question; favored the election of United States senators by direct vote; demanded the taxation of railroad and other franchise corporations; and pledged the party in the State, if placed in power, to abolish what is known as the "fellow-servant" law so far as it affects railroad and other corporations engaged in hazardous pursuits.

The Populist platform indorsed the previous platforms of Omaha, St. Louis, and Sioux Falls, and promised, if successful at the polls, to secure the higher taxation of railroads, and lower railroad tariffs, the enactment of the initiative and referendum, and the granting of liberal appropriations for the State university.

Elections.—At the regular biennial State election, held November 4, 1902, a full Republican State ticket was elected. The vote for governor was Mickey (Rep.), 96,471; Thompson (Fusionist), 91,116; giving the Republican candidate a plurality

of 5355. The State legislature for 1903 will consist of 29 Republicans and 4 Fusionists in the senate and 77 Republicans and 23 Fusionists in the house. Of the six Republican candidates for Congress, five were elected.

State Officers.—For 1902: Governor, E. P. Savage; lieutenant-governor, C. F. Steele; secretary of state, George W. Marsh; treasurer, William Stuefer; auditor, Charles Weston; attorney-general, F. N. Prout; superintendent of education, William K. Fowler; commissioner of public lands, George D. Follmer—all Republicans. For 1903: Governor, J. H. Mickey (elected for two years, term ending January, 1905); lieutenant-governor, E. G. McGilton; secretary of state, George W. Marsh; treasurer, Peter Mortensen; auditor, Charles Weston; attorney-general, F. N. Prout; superintendent of education, W. K. Fowler; commissioner of public lands, G. D. Follmer—all Republicans.

Supreme Court for 1902 and 1903: Chief justice, J. J. Sullivan (Dem.); associate justices, Silas A. Holcomb (Fus.) and S. H. Sedgwick (Rep.).

For congressional representatives, see UNITED STATES (paragraph Congressional Representatives).

NEBRASKA, UNIVERSITY OF, Lincoln, Neb., founded 1869. The faculty in 1902 numbered 220 professors and instructors, and there were 2789 students. The gross income was \$300,000. There were 55,000 volumes in the library. The determination of the regents to develop the university to its legitimate limit on the side of the most vital interest of the State—agriculture—resulted in 1902 in the establishment of new courses in forestry, animal husbandry, agricultural chemistry, and veterinary science. The chancellor in 1902 was E. Benjamin Andrews.

NEBULÆ. See ASTRONOMICAL PROGRESS.

NEEDHAM, CHARLES WILLIS, an American lawyer and educator, became president of the Columbian University, Washington, D. C., in 1902, after four years' service as dean of its school of comparative jurisprudence and diplomacy. He was born in Castile, N. Y., September 30, 1848, graduated in 1870 at the Albany Law School, and from 1874 to 1890 practised law in Chicago, where he aided in the reorganization of the University of Chicago, and served as one of its trustees. In 1890 he went to Washington, where he has since been prominent in legal circles. He was made professor of law in Columbian University in 1897, and soon after became dean of the school of diplomacy there, which he was most influential in founding and which, when formally opened in 1898, attracted wide attention from foreign jurists and diplomats.

NEEDHAM, GEORGE C., Irish-American evangelist, died in Narberth, Pa., February 16, 1902, at the age of fifty-six. He was born in the south of Ireland, and when only ten years old went to sea. On his return home he engaged in business, but soon became an evangelist and preached throughout England and Ireland. In 1868 he came to the United States, and became a close friend of Dwight L. Moody, rendering valuable assistance to Moody and Sankey in their religious work. He traveled constantly throughout the United States, occupied with his evangelistic work, in which he was very successful. His writings comprise many contributions to religious publications, a *Life of Charles Spurgeon*, with whom he was formerly associated, and several volumes, including *Shadow and Substance*; *Conflict and Courage*; *The Spiritual Life*; *Street Arabs*.

NEGRO PROBLEM. During the year 1902 the Southern question involving the relations between the white and black races was the subject of general discussion by the press of the country, and to some extent by Congress. Several incidents, some of which were of trifling importance, contributed to the reopening of the question and the revival of an issue that appeared to be settled. One of these was the act of the President of the United States in entertaining at the White House Mr. Booker T. Washington, president of Tuskegee (Ala.) Institute. This was the subject of considerable criticism by the Southern whites, many of whom openly declared that in view of their well-known race prejudices the act was an offense against Southern customs and traditions. In some quarters the President was loudly abused and charged with favoring social equality of the two races—an attitude utterly abhorrent to the Southern whites and arousing doubt in their minds in regard to his Southern policy. The distrust was further increased by an address of the President delivered at Arlington Cemetery on Decoration Day, in which he criticised the practice of lynch law in the Southern States and warmly denounced those who engage in it. The situation was still further complicated by the attitude of the President toward the so-called "Lily White" movement in the South. This was a movement among the white Republicans of several Southern States to exclude negroes from participation in the party conventions, with a view to building up a "white man's" party which would receive the support of many Democrats who have hitherto refused to support the Republican party on account of the large number of negroes in its ranks. In accordance with this view, all negro delegates were excluded from

the seats to which they had been elected in the State conventions of Alabama, Texas, Louisiana, and North Carolina. The movement also assumed definite shape in Tennessee and Virginia, although there was no exclusion of negro delegates from the party conventions. It was alleged by Republicans who were conspicuous in this movement that President McKinley, whose Southern policy had been marked by success and tact, had favored the organization of a Republican party in the South composed of white men, and that his successor, President Roosevelt, had given them to understand that he was in sympathy with the movement. The President, however, shortly after the exclusion of the negroes from the Alabama convention, announced his disapproval of such methods and by way of punishing one of the leaders of the movement removed from office the collector of internal revenue for the State of Alabama. At the same time the President caused to be announced that the administration would not stand for the exclusion of any citizens on account of race or color from participation in politics. The President's policy of appointing negroes to office in the South has also been the subject of widespread discussion and of some abuse, and has tended to reopen the race question, although the facts show that he has appointed but few such persons to office, and the appointees are recognized as competent and worthy officials. The nomination of Dr. W. D. Crum, a negro of South Carolina, to be collector of the port of Charleston, was the only negro appointment that failed to receive the confirmation of the Senate or that has provoked any great amount of opposition. The white citizens of Charleston protested against the appointment of Dr. Crum, and the legislature of the State instructed the two United States senators to use their earnest efforts to prevent the confirmation of the appointment on the ground, among other things, that it was "in disregard of the sentiment and wishes of the people." Chiefly through the efforts of Senator Tillman the appointment failed to receive the consent of the Senate, but immediately after adjournment Crum was reappointed to serve during the recess. The insistence of the President upon this appointment in disregard of the local sentiment, had the effect of provoking ill feeling among the whites, who charged that his act was a personal affront to them and calculated to increase the animosity of the whites against the negroes. In a letter of November 26, 1902, to a prominent citizen of South Carolina, the President defended his policy of appointing capable negroes to office and announced his intention not to discriminate in his appointments simply on the ground of race or color, but to appoint "only men of high character and good capacity, whether white or black." Later he wrote in the same vein to Mr. Clark Howell, editor of the *Atlanta Constitution*.

Another incident that contributed to a revival of the discussion of the race question was the act of the President in closing the post-office at Indianola, Miss., and directing that all mail addressed to inhabitants of the town be sent to the office at Greenville, 25 miles distant. The reason that led the President to take this step was the alleged pressure which was brought by some of the white inhabitants to compel the resignation of the postmistress, Mrs. Minnie M. Cox, a colored woman, who had first been appointed by President Harrison and reappointed by President McKinley. It was alleged that her life had been threatened by the lawless element of the town and that her resignation had been requested by a committee of citizens on the ground that she was a negro and therefore obnoxious to the majority of the patrons of the office. Yielding to this pressure she resigned her position. When the real facts were learned the President decided to close the office. The President refused to reopen the office without assurance from the local authorities that Mrs. Cox would not be molested. The incident was made the subject of an animated discussion in Congress, the Southern members warmly criticising the act of the President as one which punished the innocent as well as the guilty. They charged that he should have directed the prosecution by the United States courts of those who conspired by force or intimidation to compel the resignation of the postmistress, and if necessary make use of the United States troops to protect her instead of closing the office. They insisted, furthermore, that the appointment of negro postmasters is offensive to white sentiment and is certain to stir up resentment and possibly violence against the negro race. Able speeches were made in defense of the President's policy by several members, who insisted that he could not discriminate against any citizen through deference to local sentiment or prejudice and that the circumstances attending the resignation of Mrs. Cox justified the closing of the office.

The usual attempt was made in the last Congress to institute an inquiry into the suffrage conditions of the Southern States with a view to reducing their representation in Congress in accordance with the provision of the fourteenth amendment. To this end Mr. Crumpacker, a representative from Indiana, introduced a resolution to appoint a committee of thirteen to investigate the question of the denial of suffrage to negroes in the South. This measure was denounced by the Southern members as the "bloody shirt" resolution intended to revive the race question and

increase sectional antagonism. In both sessions of the Fifty-seventh Congress the measure was referred to the committee on rules, but was never reported.

A further incident of the negro question was the formulation of a demand by the ex-slaves of the South for government pensions. A bill for this purpose was introduced into the Senate of the United States by Mr. Hanna of Ohio at the last session. It provided that all persons over fifty years of age and less than sixty, who were held as slaves should receive a cash bounty of \$100 and a pension of \$8 per month; those between sixty and seventy, a bounty of \$300 and a pension of \$12 per month; and persons over seventy, a bounty of \$500 and a pension of \$15 per month. It also provided for the payment of the bounty and pension to relatives who might be charged with the care of ex-slaves.

During 1902 the project for colonizing the negroes in the insular possessions of the United States was the subject of more than usual discussion. In Congress the principal advocate of the scheme was Senator Morgan, of Alabama. He urged the scheme upon the War Department, and as a preliminary step secured the appointment of Mr. T. Thomas Fortune, a New York negro, as a special commissioner to the Philippines to study and report upon the conditions and opportunities for colonization so far as the negroes are willing to avail themselves of the chances of homes in the islands.

The twelfth annual Tuskegee Negro Conference, of which Mr. Booker T. Washington is president, was held at Tuskegee, February 18-19, 1902. A large number of prominent educators were present, both white and black, from various parts of the country, and there was a general discussion of the important problems relating to the uplifting and advancement of the negro race.

NERVOCIDINE is a new local anæsthetic obtained from an Indian plant *gasu-basu*, and discovered by a dentist in Fiume, Hungary. He separated the active principle of the drug, and treated this with hydrochloric acid. The resulting salt he termed nervocidine, a very powerful and lasting anæsthetic. Two drops of a one-twentieth per cent. solution applied to the human conjunctiva produced a burning sensation followed in twenty minutes by anæsthesia of the cornea lasting over five hours. A one-tenth per cent. solution brushed over the mucous membrane of the cheek produced local anæsthesia, loss of the sensations of taste and touch. The drug is not without its drawbacks, however, since it produces local irritation, slow anæsthesia, and a liability to nausea, vomiting, salivation, and other symptoms of general poisoning.

NETHERLANDS, a constitutional monarchy of northern Europe lying between Germany and the North Sea. The capital is The Hague.

Area and Population.—The total area of the eleven provinces comprising the Netherlands is 12,648 square miles. The population, which increased from 4,511,415 in 1889 to 5,103,924 in 1899, was officially estimated at 5,263,267 on December 31, 1901. The populations of the largest towns on December 31, 1901, were: Amsterdam, 530,718; Rotterdam, 341,050; The Hague, 218,029; Utrecht, 106,800. The constitution guarantees complete religious freedom to all denominations; there is no state church, although the royal family and a greater part of the population, belong to the Dutch Reformed Church, which is Presbyterian in its organization. All denominations receive fixed allowances from the state. Public instruction is free, and since 1900, obligatory for all children between the ages of six and thirteen. The cost of primary instruction is borne jointly by the state and the communes. At the four universities of Leyden, Utrecht, Groningen, and Amsterdam, there were 3028 students in attendance in 1899-1900. In the same year the enrollment in other public and private schools was 894,255.

Government.—The executive power is vested in the sovereign. The present ruler is Queen Wilhelmina, who succeeded her father, William III., in 1890, and was enthroned upon coming of age in 1898. The legislative authority rests jointly in the sovereign and the parliament, or States General, consisting of two chambers. The upper chamber is composed of 50 members elected by the Provincial States, or parliaments, from among the most highly assessed and official classes, for a term of nine years, one-third retiring every three years. The lower chamber is elected by direct, restricted suffrage for a term of four years. By the terms of the constitution all legislation must originate in the lower chamber, the upper chamber having the right of approval or rejection, but not of amendment. There is an advisory state council of 14 members appointed by the sovereign, and a responsible ministry, consisting of eight heads of departments. The country is divided into eleven provinces, each having its own representative body known as the "Provincial States." Each of the 1123 communes has a representative council. The ministry in 1902 was the coalition Catholic and Anti-Revolutionist government formed on the overthrow of the Liberals in 1901. It was constituted as follows: Premier and minister of interior, Dr. Abram Kuyper; foreign affairs, Baron von Lynden; justice, M. Loeff; finance, M. Harte

van Teckenberg; marine, Vice-Admiral Kruys; war, General Bergansius; commerce, industry, and dikes, M. de Mars Oyens; colonies, M. van Asch van Wijck.

Army and Navy.—The Netherlands possesses no standing army in the ordinary sense, but the regular military establishment, recruited partly by voluntary enlistment and partly by conscription, exclusive of the East Indian army, which is a separate organization, numbers on a peace footing (1900), about 27,000 officers and men. Members of the annual contingent, although nominally required to serve in person for a five-year term, actually render but twelve months active service, with six weeks practice annually thereafter for four years. There is also a militia organization, consisting of two classes, the active militia and the reserves. The army's war footing is 68,000, exclusive of officers. The navy consists of six armored cruisers, six protected cruisers, seven monitors, a large number of torpedo boats and destroyers, partially protected coast-defense vessels and gunboats.

Finance.—The unit of value is the guilder, valued at 40.2 cents. According to the budget estimates, the revenue for the years 1901 and 1902 increased from 149,472,180 guilders to 154,002,245 guilders, and the expenditure, from 154,753,492 guilders to 167,233,180 guilders. The principal sources of the revenue (1902) were: Excise duties, 50,020,000 guilders; direct taxes (land, personal, capital, and income taxes), 35,802,000 guilders; and indirect taxes, 22,161,000 guilders. The chief branches of expenditure were: Public works, 39,604,013 guilders; public debt, 34,731,380 guilders; finance, 25,444,357 guilders; and army, 23,953,441 guilders. The sum of 32,911,312 guilders was furnished by the Netherlands to the support of the East Indian, which is separate from the general budget. The national debt (1902) was 1,155,390,450 guilders. The Bank of the Netherlands, although a private institution, has the sole right of note issue, the circulation of which in 1902 amounted to 221,869,000 guilders.

Industries, Commerce, etc.—Agriculture is one of the most important industries of the Netherlands, the principal crops in order of importance, being wheat, rye, oats, barley, potatoes, and beets. The manufactures, which include textiles, bricks, pottery, butter, cheese, and cocoa, are extensive, and of increasing importance, but no official figures are obtainable as to annual production. Coal mines, mostly in the province of Limburg, extracted, in 1900, coal valued at 682,060 guilders. No official records of imports and exports are kept, the Netherlands being a free-trade country, but estimates placed the value of the imports, in 1900, at 1,968,000,000 guilders and the exports at 1,695,000,000 guilders. In the same year the transit trade was estimated at 5,808,000,000 guilders. Metals, textiles, and food products are the chief imports. The principal exports, in 1900 (in guilders), were: Cereals and flour, 191,957,000; iron and steel, 142,526,000; textiles, 88,059,000; copper, 88,292,000; and sugar, 53,786,000. The imports were chiefly from Germany, Great Britain, the United States, Belgium, and the Dutch East Indian colonies. Over 50 per cent. of the exports went to Prussia, Great Britain and Belgium taking a greater part of the remainder. In 1900 the railways had a length of 1730 miles, of which 969 miles were owned by the state. The length of the canals was, in 1900, over 2000 miles, and of the navigable rivers, about 3000 miles.

HISTORY.

Netherlands and the South African War.—It is quite natural that, bound as they are by racial ties, the Dutch in the Netherlands should have felt from the opening of hostilities in South Africa, a warm sympathy for the Boer cause. It is perhaps remarkable that this feeling has not found more open expression than it has. Early in January, 1902, Dr. Kuyper, the premier, visited London, and it was at once rumored that he had gone on a peace mission on behalf of the Boers. This was officially denied on the 16th, but on the 25th, it was announced that a communication had been addressed to the British government by the Dutch government offering its good offices in arranging a basis on which peace negotiations might be opened. The communication of the Dutch government further stated that if it were found that the Boer delegates then in Europe were willing to return to South Africa, there to confer with the Boers in the field, the Dutch government would be glad to place them in communication with British authorities on their return. To this note the British government replied on January 29 that, while they appreciated the disinterestedness of the Dutch government's suggestion, they could not recognize the right of any foreign Power to intervene in a matter which they considered to be purely a domestic concern of the British Empire. If the Boer delegates in Europe wished safe-conducts to South Africa the British government was willing to consider their application, but it was not clear, the reply continued, that they still retained any authority or influence in South African affairs. It was suggested in conclusion that the proper way for an opening of peace negotiations, if the Boers desired it, was for Steyn, Schalk Burger, and others in power in South Africa to send proposals to Lord Kitchener, as the British government had decided that the peace must be negotiated in South Africa and not in Europe. See TRANSVAAL (paragraph Peace Negotiations).

The Queen's Illness and the Succession.—In the middle of April, 1902, Queen Wilhelmina was taken ill with typhoid fever, and while she was recovering, early in May, she was prematurely confined and for some days was in a critical condition, but happily recovered. The question of her successor in case she died without issue became thus for a time a very real one. The succession in the Netherlands, if male and female heirs fail, is decided by the sovereign and parliament (or by parliament alone if the sovereign is dead) with its numbers doubled for that purpose. The present heir-presumptive is the young grand duke of Saxe-Weimar. Next in line is Prince Albert of Prussia, regent of Brunswick. Both of these heirs are princes of the German Empire, and the Dutch look with natural suspicion on any closer connection with that country.

Political Affairs.—The States-General were opened by the queen in person on September 16, 1902. The speech from the throne outlined proposed legislation in the following matters: An increase of state educational facilities, a restriction of compulsory vaccination, a system of pensions for teachers, the regulation of private and the abolition of state lotteries, and an amendment to the sugar law to make it accord with the Brussels convention. The statement in the speech from the throne that the Netherlands had no desire to enter into any foreign alliance called forth considerable comment. It was pointed out that while such an alliance might force the government into various unfortunate complications, it would in no way afford any protection not already enjoyed. For, even in view of the far-reaching pan-German movement, the independence of Holland for some time at least is assured; this is necessary for the balance of power in Europe. No government, except that of Germany, is regarded as a menace to Dutch independence, and with the other governments the balance of power is so important that they would not allow its break-up by Germany. On September 18 Baron van Lynden, the minister of foreign affairs, officially denied that there was any truth in the rumors of a German alliance. At the same time there was said to be a growing desire for securing a recognition of the complete neutrality of the Netherlands in all international affairs.

NETTLESHIP, JOHN TRIVETT, an English animal painter, died on August 30, 1902. He was born at Kettering, February 11, 1841, studied at Durham School, and in 1868 published *Essays on Robert Browning's Poetry* (reprinted as *Robert Browning; Essays and Thoughts*, 1890). This was among the first works to consider that poet seriously and in detail, and of it the *Saturday Review* observed: "He is very reverent and industrious, and his book shows many excellent characteristics of temper and tone; but his prose is bad, and his critical quality intensely jejune." He turned painter, however, and after courses at Heatherley's and the Slade School, was a regular exhibitor at the Royal Academy, and the New and Grosvenor Galleries. Best of his pictures were his animal-studies, in particular those of leopards, lions, and polar bears. These were all based on intelligent understanding and executed with much imagination, despite a certain roughness of technique more apparent in later canvases. The "Puma Devouring a Peacock" may be cited among the more interesting. Nettleship further wrote, *George Morland, and the Evolution from Him of Some Later Painters* (1898).

NEVADA, a Pacific Slope State of the United States, has an area of 110,700 square miles. The capital is Carson City. Nevada was organized as a Territory March 2, 1861, and was admitted as a State October 31, 1864. The population in 1880, was 66,266; in 1890, 45,761; in 1900, 42,335; in June, 1902, as estimated by the government actuary, it was 42,000. Nevada has the smallest population of any State in the Union and is the only State showing a steady decline for twenty years. According to the congressional reapportionment act of 1900, the population of Nevada should be increased nearly five-fold to allow it one member in the House of Representatives. The largest town in 1900 was Reno, 4,500 inhabitants.

Finance.—The cash balance in the treasury on December 31, 1901, was \$269,850.01. The receipts during the year amounted to \$497,124.82, and the disbursements to \$484,580.75, leaving a balance on December 31, 1902, of \$280,394.08. The main items of revenue and the amounts derived therefrom were: The general fund, \$175,999.61; the State school fund, \$85,618.04; and the State interest and sinking fund, \$133,977.74. The total outstanding bonded indebtedness of Nevada at the end of 1902 was \$620,100, a net reduction during the year of approximately \$60,000. All these bonds were held by the school and university funds, which at the same time, held \$900,000 in other bonds, making a total of \$1,520,100.

Agriculture and Mining.—Very little agriculture is carried on in Nevada except in the mountain valleys, where the lands can be easily irrigated. The only two crops of any considerable importance are hay and wheat, which were reported as follows for 1902: Wheat, 19,839 acres, 537,637 bushels, value, \$526,884; hay, 132,712 acres, 386,192 tons, \$3,495,038. There were in the State January 1, 1903, 76,011 horses worth \$2,655,629; 2152 mules, \$95,777; 16,010 milch cows, \$597,653; 364,165 other cattle, \$8,138,873; 1,034,826 sheep, \$2,991,166; and 14,158 swine, \$99,106.

There was a remarkable development of the gold and silver mines in 1901 and 1902. The output of gold in 1900 was \$2,023,803. In 1902, according to the director of the United States mint, the output had increased to \$3,514,212. In 1900 but \$797,290 worth of silver ore was produced; in 1901 the output increased \$2,358,000, but fell back to \$2,120,000 in 1902. In the latter year Nevada ranked sixth among the States in the production of gold and fifth in the production of silver. One of the principal developments of the year was the treatment of the tailings of the old silver amalgamation mills by the cyanide process. Several plants worked steadily at recovering the waste metal of the Comstock lode. The Montana Mining Company erected a cyanide plant near Tuscarora.

Conventions and Platforms.—The platform of the Republican party in 1902 said, with reference to the trusts and the tariff: "The Republicans of Nevada are uncompromisingly in favor of the policy of protection to American industries and American labor. We point to the present unparalleled era of prosperity and confidently appeal to the people for their judgment in support of the protective principles of tariff legislation. The Republican party pledges itself to correct any inequalities in the tariff laws, as the same may become manifest, and provide for such adjustments as will destroy all trusts and monopolies." The nomination of President Roosevelt in 1904 was called for, and a demand was made for legislation looking to the suppression of anarchy, lynching, and all forms of mob violence.

The Democratic State Convention was held at Reno on August 27, 1902. The platform declared in favor of the free coinage of silver and the removal of protective duties on trust-made articles sold to foreign consumers cheaper than to domestic consumers; advocated trust legislation; approved the applications to admit Arizona, New Mexico, and Oklahoma to statehood, and entered protest against the ship subsidy plan and imperialism. United States Senator Stewart was denounced and Congressman Newlands was commended for their positions in certain matters of current legislation. The Democrats and Silver men joined issues, divided the nominations, and ratified them in joint convention.

Elections.—At the regular biennial State election held November 4, 1902, all the State officers were voted for. The Silver party captured all the places with the exception of the superintendent of public instruction and the secretary of state, which went to the Republicans. The vote for governor was: Sparks (Silver Dem.), 6529; and Cleveland (Rep.), 4786, giving the Silver Democratic candidate a plurality of 1743. The State legislature for 1903 will consist of 9 Democrats and 4 Republicans in the senate, and 28 Democrats and 5 Republicans in the house.

State Officers.—For 1902: Governor, Reinhold Sadler; lieutenant-governor, James R. Judge; secretary of state, Eugene Howell; treasurer, D. M. Ryan; comptroller, Samuel P. Davis; superintendent of education, Orvis Ring; attorney-general, William Woodburn; surveyor, E. D. Kelley; superintendent of State printing, A. Mante—all Silver party except Ring, Republican. For 1903: Governor, John Sparks (elected for four years, term ending January, 1907); lieutenant-governor, Lemuel Allen; secretary of state, W. G. Douglas; treasurer, D. M. Ryan; comptroller, S. P. Davis; superintendent of public instruction, Orvis Ring; attorney-general, James G. Sweeney; surveyor, E. D. Kelley; superintendent of State printing, A. Mante—all Silver party except Ring and Douglas, Republicans.

Supreme Court for 1903: Chief justice, C. H. Belknap; associate justices, A. L. Fitzgerald and G. F. Talbot—all Silver party.

For congressional representatives, see UNITED STATES (paragraph Congressional Representatives).

NEW BRUNSWICK, a province of the Dominion of Canada, with an area of 28,200 square miles, and a population, according to the census of 1901, of 331,120, as against 321,263 in 1891. Capital, Fredericton; population, about 7000. In 1901 there were in the province 1741 public schools with a total enrollment of 60,420, a slight decrease both in schools and pupils as compared with 1900.

Government and Finance.—The administration of the province is in the hands of a lieutenant-governor assisted by a responsible ministry. There is one legislative assembly of 46 members, elected on a property qualification. In the Dominion Senate the province is represented by 10 members, and in the House of Commons by 13. The revenue and expenditure for the fiscal year 1901 were \$1,236,456 and \$1,112,902 respectively. Of the revenues, the chief sources were the Dominion subsidy, \$483,491; eastern extension claim, \$275,692; territorial revenue, \$200,319; taxes of incorporated companies, \$25,289; liquor licenses, \$21,307. Of the expenditure, the chief items were for education, \$200,681; public works, \$295,077; interest (not chargeable to special funds), \$136,135. The provincial debt on October 31, 1901, was \$3,496,502.

Industries, Commerce, etc.—The trade of the province for the fiscal year 1902 was considerably in excess of that of the previous year, the exports being \$17,657,751, as compared with \$14,886,454 in 1901, and the imports \$7,307,271, as compared with

\$6,741,848. The leading crops for 1901 were: Oats, 4,944,992 bushels; buckwheat, 1,479,477 bushels; potatoes, 4,077,478 bushels. The production of cheese in 1901 amounted to 1,887,370 pounds, and of butter 542,646.

NEWFOUNDLAND, a British island colony of North America, with an area of 42,200 square miles. Labrador (*q.v.*) is a dependency of the colony. The population of the island and dependency, according to the census of 1901, was 220,249, of which Newfoundland had 216,615 and Labrador 3634, as compared with 197,930 and 4106 respectively in 1891. Of the total population 76,259 were Roman Catholics, 72,650 Anglicans, 60,812 Methodists, while members of the Salvation Army numbered about 6500.

Government and Finance.—The colony is administered by a governor, who is assisted by an executive council. There is a legislative council of 15 appointed life members, and a legislative assembly of 36 members, elected by popular vote for four years. The financial condition is prosperous. The revenue for the fiscal year 1902 was about \$2,200,000, exceeding that of the previous year by \$100,000. The public debt in 1902 was nearly \$20,000,000. Sir Cavendish Boyle is governor.

Industries and Commerce.—Fishing, chiefly cod, is the chief industry, but the development of the forests and of mineral deposits was carried on in 1902 with unusual enterprise. The annual value of the fisheries is over \$6,000,000. The herring fisheries in 1902 were exceptionally prosperous. The official report of the mineral production for 1901 shows it to be considerably in excess of that of the previous year, the copper mined being 75,348 tons, as compared with 70,614 tons in 1900, and the iron ore, 738,206 tons, as compared with 320,463 tons in 1900. Agriculture has not until recently prospered much, but the improved general outlook in 1902 has given an encouraging impetus to this branch of industry. The imports and exports for 1901 were considerably in excess of those for 1900, which were \$7,497,147 and \$8,627,576, respectively.

History, 1902.—The long-standing question of French fishing rights on the west shore continued to harass the colonists during the year. Complaints were made that they were harshly treated by the French fishermen, and many of them carried guns in their boats in order to protect their nets. On the expiry of the *modus vivendi* with France on December 31, 1901, Colonial Secretary Chamberlain asked that the Newfoundland legislature renew it for another year, and the latter agreed to do so as a contribution in aid of the imperial cause in South Africa, Great Britain being at that time in no condition to take up the question of the fisheries difficulty with France. The *modus vivendi* was renewed in February, 1902. The colonial legislature assembled on February 20, and passed bills to preserve the whale fishery, to encourage the exploitation of the iron ore deposits, and to promote the export of fishery products by establishing cold storage.

The question of confederation with Canada came to the front again during 1902, partly by reason of the resignation of Mr. Justice Morrison from the bench in order to lead a political party in promotion of union with the Dominion. Premier Bond would not favor the movement until Canada would offer better terms, and Mr. Morine, leader of the opposition, declared that the question cannot be a party one, but must be taken up by both sides, and he added that a majority of the people were indifferent to it. The argument advanced in favor of it by Mr. Morine and his supporters is that Newfoundland could get better terms from the United States if she were a province of the Dominion than she can in her present position, and that if the change were made the French shore difficulty could be finally settled. A treaty between the United States and Newfoundland took effect on August 1, 1902, by which domestic money-order rates will apply between the two countries. The conclusion of the dispute between "Czar" Reid, the well-known contractor, and the government as to the amount fairly due Mr. Reid under the claim made by him was effected by an arbitration tribunal, presided over by Alfred Lyttleton, a member of the British House of Commons. By the decision on October 8 Mr. Reid was unanimously awarded \$854,000.

The most important event of 1902, from an industrial point of view, was the negotiations at Washington, which resulted in the Bond-Hay reciprocity treaty, signed on November 8. The treaty, if ratified by the United States Senate, will secure privileges for American fishermen in Newfoundland waters, as well as for the entry of American goods, and in return will permit the free entry into the United States of the fish product of the island, excepting fresh or "green" cod. It is in essentials similar to the Bond-Blaine convention, which was disallowed by Great Britain in 1890.

NEW GUINEA, or PAPUA, the largest of the East Indies, has an estimated area of 306,000 square miles, and an estimated population of about 660,000. It comprises three dependencies, belonging to Great Britain, Germany, and the Netherlands.

British New Guinea, a colony comprising the southeastern part of the island, has a mainland area estimated at 87,786 square miles, besides islands aggregating 2754 square miles. The estimated population is about 350,000. In November, 1901, the Commonwealth of Australia undertook the administration of the government. The capital is Port Moresby. In the fiscal year 1900 revenue and expenditure amounted to £13,831 and £19,315 respectively, and imports and exports £72,286 and £56,167 respectively.

In May, 1902, the bishop of New Guinea stated that cannibalism in that island was still practised, and he cited a number of recent instances, including the murder of Rev. James Chalmers and a number of his assistants in April, 1901. The bishop stated that the government staff is so small and the area over which it has jurisdiction so large that little can be done effectively towards stamping out cannibalism. Efforts, however, are being made through the schools, of which there are fifteen, with one thousand native children in attendance, while fifteen thousand natives are under the influence of the Church of England Mission, which has a staff of about thirty members.

Kaiser Wilhelm's Land, or German New Guinea, constituting the northern division of the eastern part of the island, has an estimated area, including several adjacent islands, of 69,027 square miles and a population estimated at 110,000. The protectorate, with the Bismarck Archipelago (*q.v.*) and the Solomon Islands, is administered by an imperial commissioner stationed at Herbertshöhe in the archipelago. The local capital and one of the chief harbors is Friedrich Wilhelmshafen. For the fiscal year 1903 the estimated revenue (including an imperial contribution of 722,000 marks) and expenditure balanced at 822,000 marks. (The mark is worth 238 cents.) In the fiscal year 1900 imports and exports were valued at 377,681 marks and 212,117 marks respectively. The tobacco export amounted to 119,360 marks, and the copra 65,000 marks.

Dutch New Guinea, comprising the western division of the island, has an estimated area of 157,789 square miles and an estimated population of over 200,000. Administratively the colony is regarded as a part of the residency of Ternati, Molucca Islands; but Dutch authority is very limited, and most of the districts are under the rule of native sultans. Early in 1902 reports were widely current that on January 1 cannibals had murdered near Sileraka twenty-five members of a French scientific expedition, but later in the year they were denied. *Petermann's Mitteilungen*, indeed, maintained that there had been no such expedition.

NEW HAMPSHIRE, a New England State of the United States, has an area of 9307 square miles. The capital is Concord. Population, in 1900, was 411,588, while in June, 1902, as estimated by the government actuary, it was 419,000. The populations of the two largest cities in 1900 were: Manchester, 56,987; Nashua, 23,898.

Finance.—The report of the treasurer for the fiscal year ending May 31, 1902, showed that cash on hand on June 1, 1901, amounted to \$447,907.02; that total treasury receipts during the year were \$1,389,322.67, and that the disbursements during the year were \$1,261,614.57, leaving cash on hand on June 1, 1902, amounting to \$575,615.12. At the same time the funded debt of the State amounted to \$839,200; the trust funds debt to \$813,574.37, and other liabilities to \$16,276.93, making a total of \$1,669,071.30. If from this sum is deducted the cash on hand, amounting to \$575,615.12, and other assets amounting to \$337,023.82, the net State liabilities remaining on June 1, 1902, would be \$756,432.36. Of the revenue for the year, \$425,000 was derived from the State tax; \$158,341.77 from the railway tax; \$40,444.89 from the insurance tax, and \$108,372.53 in settlement of a long pending claim of New Hampshire against the United States government for interest paid on bonds issued to provide funds to raise and equip the State's quota of troops in the Civil War.

Agriculture and Manufactures.—The principal crops for 1902, as reported by the *Crop Reporter*, were: Corn, 28,761 acres, 670,131 bushels, value, \$489,196; potatoes, 18,650 acres, 2,238,000 bushels, \$1,544,220; hay, 625,851 acres, 663,402 tons, \$8,989,097. According to the report of the New Hampshire Bureau of Labor for the year ending June 30, 1901, there were 1454 manufacturing establishments in the State, having a total capital of \$88,943,235 and producing a gross product valued at \$111,933,030. The total number of wage-earners was 74,883, receiving in wages \$28,253,304. There were also employed in the manufacturing industries 1784 salaried clerks and officials receiving \$1,907,124. The statistics for the previous year showed a total capitalization of manufacturing industries amounting to \$86,632,297, a gross product of \$103,429,553, and total wages of \$26,144,340. The total amount invested in permanent repairs and improvements during the fiscal year 1900-01 was \$1,720,063. The following table gives statistics of the eight leading industries of New Hampshire for the fiscal year 1900-01.

INDUSTRY.	Capital Invested.	Value of Gross Product.	Total Number of Wage Earners.	Total Wages Paid.	Amount Invested in Permanent Repairs, Enlargements, etc.
Cotton and printcloth	\$25,335,861	\$28,693,353	24,214	\$5,422,146	\$400,398
Boots and shoes.. ..	5,957,827	22,388,189	12,864	4,934,886	50,043
Lumber	8,880,485	8,032,712	7,005	2,501,802	149,816
Woolen goods	6,134,417	5,816,599	3,159	1,202,655	244,245
Paper and paper products	7,714,573	4,517,644	1,754	780,288	230,818
Machines and machinery	2,072,565	2,661,300	7,005	2,501,802	149,816
Hosiery and knit goods	1,662,000	2,660,443	2,671	780,269	16,240
Food preparations.. ..	1,153,948	2,438,764	351	126,816	20,816

The cotton industry has recovered the lead among the industries of the State which it lost to the boot and shoe industry in 1899. The value of cotton manufactures increased \$4,972,591, or about 17 per cent., from 1900 to 1901, while the value of boots and shoes decreased \$1,714,071, or about 7 per cent. The lumber production increased during the same time about \$1,374,461, or more than 20 per cent.

State Liquor Laws.—The liquor laws of the State, although never enforced, have, for the past fifty years, forbidden the sale of intoxicating liquors by any persons except properly authorized State and town agents. Attempts made in Manchester to establish and carry out a plan known as the "Healey system" failed. It virtually meant licensing by means of periodical fines, which aggregated about \$1000 annually for each of the sixty saloons doing business in that city. The Healey system developed strong opposition among business men, leaders of the temperance movement and others, who did not approve of the system because it had been inaugurated without authority from the legislature, and because of its demoralizing tendency. Efforts were made to check the spreading movement, and finally, D. H. Goodell, the former governor of the State, petitioned the Superior Court to issue a writ of mandamus requiring the local authorities to carry out the law. On January 1, 1902, a hearing was given by Judge Peaslee, who granted a writ, to take effect from January 4. For a time the law was rigorously enforced as a result of Judge Peaslee's action, but, owing to the unpopularity of the law, the Healey system again came into practice. The movement, however, in the direction of reform, aroused such deep interest that the question of prohibition has become a clear-cut political issue, which will probably result in a change in the liquor law.

Conventions and Platforms.—The Democratic State Convention was held at Concord September 10, 1902. The platform called for the immediate abolition of all tariffs upon trust-made articles; the enforcement of existing laws against trusts and other combinations, also the enactment of new laws to strengthen those now in force; the restriction of corporations other than banks and insurance companies from holding stock in other corporations, and the amendment of the State prohibitory liquor law in such a way as to place control in the hands of the majority in cities and towns. The Republican State Convention was held at Concord on September 17, 1902. The platform indorsed the administration of President Roosevelt. Regarding the trusts the platform said: "While we favor legitimate combination of capital which will reduce the price of necessities to the people, we condemn any such combinations as will restrict business and throttle competition by unjust and tyrannical practices."

Elections.—At the regular State election, held November 4, 1902, the full Republican State ticket was elected. The vote for governor was: Bachelder (Rep.), 42,115, and Hollis (Dem.), 33,844, giving Bachelder a plurality of 8271. The State legislature for 1903 will consist of 21 Republicans and 3 Democrats in the senate, and 256 Republicans and 137 Democrats in the house.

State Officers.—For 1902: Governor, Chester B. Jordan; secretary of state, E. N. Pearson; treasurer, Solon A. Carter; attorney-general, Edwin G. Eastman; superintendent of education, Channing Folsom; secretary of the board of agriculture, N. J. Bachelder; commissioner of insurance, John C. Linehan—all Republicans. For 1903: Governor, N. J. Bachelder, elected for two years, term ending January, 1905; secretary of state, E. N. Pearson; treasurer, Solon A. Carter; attorney-general, Edwin G. Eastman; superintendent of education, Channing Folsom; secretary of the board of agriculture, N. J. Bachelder; commissioner of insurance, J. C. Linehan—all Republicans.

Supreme Court for 1903: Chief justice, Frank N. Parsons (Rep.); associate justices, William M. Chase (Dem.), Reuben E. Walker (Rep.), James W. Remick (Rep.), George H. Bingham (Dem.).

For congressional representatives, see UNITED STATES (paragraph Congressional Representatives).

NEW HEBRIDES, a group of islands lying west of Fiji, have an area of about 3000 square miles and a population of about 100,000. The status of the New

Hebrides rests upon the Anglo-French agreements of November 16, 1887, and January 26, 1888, whereby the protection of persons and property was entrusted to a joint naval commission of two British and two French officers and a president who in alternate months is the British or French commanding officer on the station. The British and French settlers are about equal in number, but Protestant propaganda among the natives has been more successful than Roman Catholic. Prejudicial to native and to British interests is the attitude of the French, who buy land from the natives at insignificant rates, making payment in "arms, ammunition, and alcohol." The French government seems indisposed to correct abuses by which its hold on the islands is being steadily strengthened. The action of the French has caused much irritation among the Australians.

NEW JERSEY, a Middle Atlantic State of the United States, has an area of 8815 square miles. The capital is Trenton. New Jersey was one of the original thirteen States. The population in 1900 was 1,883,669, while in June, 1902, as estimated by the government actuary, it was 1,978,000. The populations of the five largest cities in 1900 were: Newark, 246,070; Jersey City, 206,433; Paterson, 105,171; Camden, 75,395; and Trenton, 73,302.

Finance.—On November 1, 1901, the balance in the State treasury amounted to \$2,465,520.16. The total receipts during the year were \$7,150,165.50 and the total disbursements \$6,755,676.94, leaving in the treasury on October 31, 1902, \$2,880,008.72. The main items of revenue and their aggregate amounts were as follows: From the State fund, \$4,317,846.08; from the school fund, \$603,341.47; from the State school tax, \$1,486,806.75; from the local tax on railway corporations, \$400,784.47; from the allotment of taxes on railroad and canal property of the taxing districts, \$200,461.93. In the amount received from the State fund was \$149,576.74 from the collateral inheritance tax; \$150,000 from the repayment of loans to the school fund; \$130,966.90 from the commissioner of banking and insurance, and \$593,287.27 from the secretary of state, mainly on account of fees for incorporation. The last of the State debt, amounting to \$71,000 on war bonds, was paid during the year.

Agriculture and Industries.—The principal crops of New Jersey for 1902, as given by the *Crop Reporter*, were as follows: Corn, 292,770 acres, 10,100,565 bushels, value, \$4,598,739; hay, 408,081 acres, 497,859 tons, \$7,786,515. There was considerable growth of the industries of the State in 1902. Two new cotton mills, three woollen mills, twelve silk mills, and eight knitting mills were built. Only Pennsylvania built more silk mills. The production of pig-iron increased from 155,746 tons in 1901, to 191,380 tons in 1902, and the production of zinc oxide from 47,821 short tons to 46,500 tons. Nearly all of it was made at the works of the New Jersey Zinc Company. New Jersey was one of the foremost producers of Portland cement. Clay products, including brick, tile, and pottery, valued at \$11,681,878, were produced in 1901, an amount exceeded only by Ohio and Pennsylvania.

Conventions and Platforms.—The Republican State Convention was held at Trenton September 26, 1902. The course adopted by President Roosevelt in continuing the policy of his predecessor was approved and the support of the Republicans of New Jersey was promised. The party declared itself to be the friend of labor and pledged itself to maintain the rights and liberties of the working people and protect them from any encroachments thereon. The platform indorsed the administration of Governor Murphy and called attention to the fact that "under the policy inaugurated by the Republican party in this State, over \$800,000 was appropriated at the last session of the legislature toward the payment of the State school tax, every dollar of which is a contribution toward the reduction of local taxes. More than \$1,500,000 of the State's income is now annually disbursed to our various taxing districts as their dividend from a wise administration of State affairs."

The Democratic State Convention was held at Trenton October 1, 1902. The platform was taken up chiefly with State issues. It omitted all mention of Mr. Bryan and national finance. It denounced the Republican governor and legislature and asked for a thorough revision of the State tax laws. Concerning labor and capital it said: "Every attempt on the part of organized labor to secure legislation in its interest has been defeated by the Republican party. It has shown that it is hostile to the wage-workers of the State. Every important act on the statute books in the interest of labor was placed there by Democratic legislatures. We believe that the true interest of labor and capital lies in a complete comprehension of their respective rights and duties and a common desire to have a complete understanding between them. They are friends, and not foes. Great loss has fallen upon the industrial interest of the State by bitter struggles, which have resulted in strikes and discontent." The platform extended sympathy to the Boers and favored the election of United States senators by direct vote of the people.

Casualties.—Several serious casualties occurred in the State during 1902. In February the city of Paterson was flooded by the overflowing of the Passaic River. The factories were obliged to close, and the main part of the city, during the height

of the flood, was several feet under water; this was followed on the 9th of the month, by a fire that did damage to the amount of nearly \$10,000,000. The section consumed by the fire, which lasted a night and a day, was over a mile in length and one-third of a mile wide. There were no lives lost, but it was found necessary to call out the militia of the district to maintain order and prevent depredation. The rebuilding of the burned section was undertaken promptly, and at the end of the year many new buildings had been erected. In April, a great fire occurred at Atlantic City. Several large hotels were destroyed and a number of residences and business buildings were badly damaged. The total loss was estimated at more than \$1,000,000.

Labor Troubles.—Serious riots took place in Paterson on June 18, 1902. They had their origin in a strike of the silk dyers in the largest mills. The strike had been threatened for nearly two months. During the latter part of April the head of one of the dye mills was called upon by letter to revise his time-limit, making it 55 hours a week. A request was made at the same time for payment of 20 cents an hour and 30 cents overtime for the dyers' helpers, who had hitherto been receiving 16½ cents an hour, or \$9 a week. In the demand, a decision was called for within thirty minutes. As this was not forthcoming, the employees struck. They then visited the other silk mills in the city, and, during the day, strengthened their numbers to 3700, including dyers, helpers, and silk finishers. The strikers remained out for nearly eight weeks without creating any disturbance. During this time they formed a union which they termed the United Dyers, Helpers, and Finishers of America. The mill owners, on their part, organized the Silk Dyers' Association. When the rioting began in June the mob was led by two men prominent among the strikers. The mills were attacked and much property was destroyed. Prominent among the leaders of the strike was William MacQueen, an English anarchist. The police proved unable to control the crowds. The mayor of Paterson took a personal part in restoring order. He superseded the chief of police, and, with the aid of the fire department, quelled the rioters after ten had been wounded. The governor of the State responded to an appeal for help by sending troops promptly, but when they reached the city, order had been restored. The strike was declared off a week later. In connection with this disturbance, a vigilance committee to stamp out anarchism was formed by the citizens. On June 30, MacQueen was arrested. On the same day the dye-houses and nearly all the silk mills resumed operations.

Elections.—At the regular annual State election, held November 4, 1902, the entire Republican State ticket was elected. The State legislature on January 28, 1902, elected J. F. Dryden (Rep.) United States Senator to serve out the unexpired term of the late William S. Sewall (Rep.), ending March 4, 1907. In the Republican caucus, held January 23, Mr. Dryden was nominated after nineteen ballots, his chief competitors in the contest being ex-State Senator Edward C. Stokes, and ex-Attorney-General John W. Griggs. The State legislature for 1903 will consist of 14 Republicans and 7 Democrats in the senate, and 38 Republicans and 22 Democrats in the house.

State Officers.—For 1902 and 1903: Governor, Franklin Murphy, elected for three years, term ending January, 1905; secretary of state, George Wurts to April, 1902; S. D. Dickinson to April, 1907; comptroller, William S. Hancock to April, 1903; J. Willard Morgan to April, 1906; treasurer, Frank O. Briggs, to April, 1906; attorney-general, Samuel H. Grey to April, 1902; Thomas N. McCarter to April, 1907; superintendent of public instruction, Charles J. Baxter to April, 1903, reappointed for term ending April, 1906; commissioner of banking and insurance, William Bettle to April, 1903—all Republicans.

Supreme Court: Chief justice, W. S. Gummere (Rep.); associate justices, John F. Fort (Rep.), J. Dixon (Rep.), B. Vansyckel (Dem.), C. G. Garrison (Dem.), A. Q. Garretson (Dem.), M. Pitney (Rep.), Charles E. Hendrickson (Dem.), Gilbert Collins (Rep.).

For congressional representatives, see UNITED STATES (paragraph Congressional Representatives).

NEW JERUSALEM, CHURCH OF THE, comprises the General Convention of the New Jerusalem in the United States of America and the General Church of the New Jerusalem, the latter in 1897 having become an independent division of the New Church. In the United States the Church of the New Jerusalem, whose adherents are more commonly known as Swedenborgians, dates from 1792, when the first congregation was formed, and as an organized body, from 1817, the year of the establishment of the General Convention. The larger division of the church, the General Convention, for 1902, reports 6812 members, 108 ministers, and 108 societies. Under its auspices are Urbana University, Urbana, O.; the New Church School, Waltham, Mass.; and a theological school in Cambridge, Mass. The General Church of the New Jerusalem, with headquarters at Huntingdon Valley, Pa., has an approximate membership of 600. It maintains, at Huntingdon Valley, an academy including a theological department, and colleges for boys and girls. The General Church

is represented by *New Church Life*, and the General Convention by *The New Church Messenger*.

NEW MEXICO, a southwestern Territory of the United States, has an area of 122,460 square miles. New Mexico was organized as a Territory, December 13, 1850. The capital is Santa Fé. The population in 1900 was 193,510, while in June, 1902, as estimated by the government actuary, it was 203,000. The largest city in 1900 was Albuquerque with 6238 inhabitants. This population of the Territory is stated by the governor to be much below actual numbers, and in proof of this he brings forward the fact that in October, 1900, there were 59,297 registered voters, and that allowing for five persons to one voter, the total population could not be less than 296,000, an excess of 100,000 over the census returns.

Finance.—The assessed valuation of property in New Mexico in 1902 was \$41,108,745.07. The bonded debt on June 1, 1902, was \$1,123,300; sinking funds on hand for the redemption of bonded debt, \$89,246.26, leaving a net bonded debt of \$1,034,053.74. The Territorial tax levy for all purposes in 1902 was 13.99 mills on the dollar. During the fiscal year ending June 30, 1902, there were formed in New Mexico 110 corporations, with a total capitalization of \$73,017,630, for the purposes of mining, milling, and smelting; 63 with a total capitalization of \$4,796,500 for manufacturing and other industrial enterprises; 6 banking and loan associations with a total capitalization of \$4,830,000; 5 railway banks with a capital of \$6,200,000, and 10 irrigation and land improvement banks, with a capitalization of \$2,011,000. The gain in the number of industrial corporations organized in 1902 over those in 1901 was 53. The coal and coke industry gives employment to some 2000 persons, and the machinery and operating plants are valued at \$715,000. The net output of the coal mines for 1902 was 1,102,046 tons, valued at the mines at \$1,609,898.90. Coke production for 1902 amounted to 25,012 tons, valued at \$58,207. The gold, silver, lead, and copper output of the year was estimated at between \$6,000,000 and \$7,000,000, and the value of the turquoise mined in New Mexico was about \$138,000.

Agriculture and Industries.—The leading farm products of New Mexico as given by the *Crop Reporter* for 1902, were: Corn, 36,909 acres, 811,998 bushels, value, \$633,358; spring wheat, 45,624 acres, 780,170 bushels, \$670,946; hay, 72,077 acres, 172,985 tons, \$1,933,972. For the year ending June 30, 1902, no less than 133,835 head of cattle were inspected for removal from the Territory, and the income derived from these shipments amounted to nearly \$3,000,000. The number of sheep owned in the Territory was estimated at 5,000,000, and the wool clip for 1902 surpassed the 20,000,000-pound mark. Spring lambs in 1902 numbered about 1,000,000. Shipments for the year amounted to 406,908 head, selling as high as 3½ cents per pound and netting the grower as high as \$2.40 per head. A conservative estimate of the live stock on the ranges of New Mexico at the end of 1902 put the value at \$40,000,000.

Irrigation.—More than 3000 miles of irrigation ditches are now in operation in the Territory, the cost of which exceeds \$6,000,000. In the northwest is the Springer system of irrigation with 50 miles of ditches and five reservoirs, covering 22,000 acres. The Vermejo system, in the same region, controls 57 miles of ditches, having ten reservoirs, and supplies water for 30,000 acres. There are now in active operation 40 miles of canals and main laterals so arranged that at any time they can be extended in any direction. The annual water rent imposed by the irrigation companies is about \$1.25 per acre. No less than fifty companies have been organized for irrigation projects in the central portion of the Territory, and several plants were put in operation. There were, in 1902, about 125,000 acres under irrigation from wells, making the grand total of irrigated lands nearly 400,000 acres.

Land Conditions.—The work of the United States Court of Private Land Claims in settling titles to the Spanish and Mexican land grants continued throughout 1902. During the life of this court it has adjudicated title to about 24,000,000 acres of land claimed under various grants and titles, all of which, with the exception of about 1,000,000, has been determined to be public land and restored to the public domain. Cases involving about 141,760 acres are still pending. Within the last two years (1901 and 1902) a total of 1,112,551.54 acres of the public domain have been entered under the homestead and various other government land laws. Two-thirds of the area taken up is in the counties of Colfax, Union, Guadalupe, Santa Fé, Lincoln, Chaves, and Otero, contiguous to the new lines of railroad.

Under act of Congress June 21, 1898, donating a limited area of the public lands to the benefit of the Territory for educational and other worthy purposes, the United States Commission has selected and entered for the benefit of the various institutions 820,026.58 acres, including 79,693.25 acres of saline lands. In view of the present urgent needs for utilizing every possible available resource for advancing the Territory's educational development the governor urges that additional grants of public lands be made to New Mexico. There were in 1902 more than 50,000,000 acres of the public domain within the borders of the Territory, the area having been

increased through the operations of the United States Court of Private Land Claims during the past three years by about 6,000,000 acres, hitherto claimed as land grants.

The Territory, owing to its sheep and cattle interests, is especially concerned in the enactment of the proposed national lease law.

Educational.—The statistics for the school year 1900-01 showed a school population of 62,864, an increase over the previous year of 9856, or 18.6 per cent. The total enrollment in the schools was 42,925; the average attendance 29,825. The number of schools was 726; the number of teachers, 1046, drawing \$412,340.28 in salaries. The annual receipts for school purposes were \$838,018.70; the annual expenditures were \$723,048.32; the value of all school property was \$2,071,702.25; the amount expended in improvements on public school property during the year was \$242,617.60; the average annual cost of educating pupils enrolled in Territorial institutions was \$159.66 per capita.

Needs of the Territory.—The governor in his report for 1902 stated as the first requirement of the Territory, the need of capital to exploit and develop the mines of precious metals, coal, and iron, as well as to aid agriculture and stock growing. In view of the progress that the Territory has already made, its natural resources, its educational institutions, and all the elements constituting good citizenship, he alleged that there could be no good reason for longer refusing New Mexico admission to statehood. This question, indeed, was much discussed during 1902. The fact that the Spanish-speaking element, which forms a large part of the population, is to a great extent illiterate and lacking in knowledge regarding the principles and methods of government in the United States has introduced an element of grave doubt as to the advisability of granting the privilege asked for until educational and other developments become more satisfactory. The proportion of illiteracy among the native whites, which is greater than in any other State or Territory, is a most serious drawback. Again, the proportion of females to males is, it is contended by many, far too small to insure settled conditions. Only in the neighborhood of Santa Fé, is the proportion of the sexes at all equal. New Mexico was included in the area covered in November by Senator Beveridge's committee, sent from Washington to visit the southwestern Territories to study the entire situation with a view of making a report for the information and guidance of Congress. The general sentiment of the country in 1902 seemed to be against the admission of the southwestern Territories till they should have developed further in wealth, population, and education.

Territorial Officers.—For 1902 and 1903: Governor, Miguel A. Otero; secretary, J. W. Reynolds; treasurer, J. H. Vaughn; auditor, W. G. Sargent; adjutant-general, W. H. Whiteman; attorney-general, E. L. Bartlett; superintendent of education, J. F. Chaves—all Republicans.

Supreme Court in 1902 and 1903: Chief justice, William J. Mills; associate justices, John R. McFie, Frank W. Parker, Daniel H. McMillan, and Benjamin S. Baker—all Republicans.

NEW SOUTH WALES, a southeastern state of the Commonwealth of Australia. The capital is Sydney, with a population in 1901 of 111,801.

Area, Population, etc.—The estimated area of the state is 310,700 square miles. The population in 1901 was 1,359,537, which was an increase of a little more than 20 per cent. for the decade 1891-1901. In religious affiliation over 500,000 of the inhabitants are adherents of the Church of England and about 300,000 are Roman Catholics. Education, controlled by the state, is compulsory. The total enrollment in 2818 state schools in 1901 was 241,790. The enrollment for the same year in the 889 private schools and colleges was 60,282. The expenditure of the state on education in 1901 amounted to £918,819.

Government and Finance.—The executive power in the state is exercised by a governor appointed by the crown (Vice-Admiral Sir Harry Rawson, appointed 1902), and assisted by a responsible ministry of ten members. The legislative power is vested in a parliament consisting of a legislative council appointed by the crown and an elected legislative assembly. The revenues of the state government for the fiscal year ending June 30, 1902, were £10,612,422, as compared with £10,794,233 for the preceding year. The expenditure in the same years increased from £10,176,761 to £10,729,741. The public debt at the close of the fiscal year 1901-02 was £67,361,246, an increase from £65,332,993 in the previous year. The revenue is derived largely from taxation (customs, excise, land, stamp, and income taxes), the public lands and the income from public services (railways, posts, telegraph, water supply, etc.). The largest expenditures are for construction and maintenance of public works (largely reproductive), state railways, public instruction, and interest on the public debt.

Industries, Commerce, etc.—Of the total area of the state only a little over 1 per cent. was under crop in 1900-01. One-quarter of the area is covered with forests. The production of the principal crops for the year ending March 31, 1902, was as follows: Wheat, 14,808,705 bushels; maize, 3,844,903 bushels; potatoes, 39,146 tons;

sugar-cane, 187,711 tons; wines, 868,479 gallons; oranges, 604,546 cases. The hay crop for 1901 was estimated at 348,406 tons. There are valuable mineral deposits, including coal, copper, silver, gold, lead, platinum, and precious stones. The value of all minerals mined in 1901 was £5,854,150, of which gold amounted to £921,282. The number of persons employed in the mines and smelters in 1900 was 46,806. There were in 1901 3362 manufactories employing 66,135 persons. Stock-raising and sheep-farming are among the most important of the state's industries. At the beginning of 1902 there were 486,716 horses, 2,047,454 cattle, 41,857,999 sheep, and 263,730 pigs; but the continued drought probably reduced all these totals considerably by the end of the year. The wool clip in 1900 was stated at 237,659,726 pounds, valued at £7,676,805. In 1901-02 there was a considerable falling off in both the imports and exports, the value of the former having decreased from £27,561,071 in 1900-01 to £26,928,218, and the latter from £28,164,516 to £27,351,124. The principal articles of export (not including bullion) in order of value are wool, coal, wheat, hides and skins, tallow and leather. On June 30, 1902, there were 3,107.5 miles of railway in operation, all but 81.5 being owned and operated by the state. The construction cost of the state lines on that date was £40,565,073. The net profits from the state lines for 1900-01 were £1,530,578. There were 104 miles of state tramways constructed, at a cost of £2,829,578.

History.—The State Parliament opened on May 28, 1902. In his opening address the new governor, Sir Harry Rawson, who had been appointed in January, declared that the government would seek to curtail the loan expenditure on public works. The ministerial programme included a bill for the reform of municipal corporations, a bill for the extension of the suffrage to women, and proposals for a referendum to reduce the membership of the legislative assembly from 125 to 94. All of these measures were speedily enacted with little opposition. More important than any legislation of the year was the organization of the Industrial Arbitration Court provided for by an act passed late in 1901. By this act New South Wales actually surpasses New Zealand in taking from employers the right of managing their own business. The act is based on that of New Zealand, but differs from it in having no boards of conciliation. Like the New Zealand act, its critics declare, it will have the effect of creating disputes instead of preventing them. The act provides for the appointment of a registrar, who shall register as "industrial unions" any person or company or associations of persons or companies employing 50 workers, and any trade union or branch thereof. The judges of the court consist of a judge of the State Supreme Court as president, and one representative of the employers and one of the workers, all appointed for three years. It has full power to make inquiries, may call for evidence, legal or otherwise, determine its own procedure and summon before it any one it chooses. Its decisions are final, and a decision given in any single dispute becomes a common rule applicable to the whole industry. The court may determine the minimum wage, hours of employment, terms of employment or dismissal, and the interpretation of any industrial agreement.

NEW YORK, a Middle Atlantic State of the United States, and one of the original thirteen, has an area of 49,170 square miles. New York has a larger population than any other State in the Union, the number of its inhabitants in 1900 being 7,268,012, while in June, 1902, as estimated by the government actuary, it was 7,538,000. The populations of the largest cities in 1900 were: New York, the largest city in the United States, 3,437,202; Buffalo, 352,387; Rochester, 162,608; Syracuse, 108,374; Albany, 94,157; Troy, 60,651; and Utica, 56,383.

Finance.—The report of the comptroller of New York for the year ending September 30, 1902, showed that the balance on hand on October 1, 1901, was \$9,789,351.16; the total actual receipts during the year were \$23,660,775.43; the total actual expenditures \$23,220,272.68, and the balance on September 30, 1902, \$10,229,853.91. The main items of revenue were derived from direct taxes netting \$6,973,663.82; taxes on corporations netting \$6,606,750.29; an inheritance tax netting \$3,393,554.72, and a liquor tax netting \$4,221,671.99. The main items of expenditure were: State departments, commissioners, etc., \$2,350,354.08; charitable institutions, including hospitals for the insane, \$6,803,762.25; educational institutions, \$5,367,016.85; canals, \$2,263,092.29; legislature, \$615,195.22; legislative printing and advertising, \$724,664.90; judiciary, \$1,019,515.57; national guard, \$648,735.95; the maintenance of prisons, \$1,095,815.94, and highways, \$567,173.86. The total State debt at the end of the year, of which the entire amount was funded, was \$9,920,660, and the amount of the debt reduction during the year was \$155,000. Since 1880 New York legislation has been directed to devising a uniform system of indirect taxation sufficient for all the State's needs; and the extent of this movement may be judged from the fact that since the passage of the original corporation law of 1880, the receipts from indirect taxation have been steadily increased from \$141,127.03 to \$16,236,446.99. Further recommended changes in the indirect tax laws intended to

do away entirely with the necessity of direct taxation were: To amend the Ford franchise law so as to assess corporations upon their earning capacity; to tax mortgages; to levy a tax of 10 cents on each notary certificate, and to put a tax of 10 cents per hundred dollars on the recording of all transfers of real and personal property.

Agriculture and Industries.—The principal agricultural crops for 1902 as given in the *Crop Reporter* were: Corn, 645,230 acres, 16,130,750 bushels, value \$10,807,602; winter wheat, 278,196 acres, 8,033,693 bushels, \$6,346,617; oats, 1,324,564 acres, 52,982,560 bushels, \$19,073,722; barley, 117,867 acres, 3,359,210 bushels, \$1,847,566; rye, 164,815 acres, 2,884,262 bushels, \$1,672,872; buckwheat, 335,015 acres, 5,929,766 bushels, \$3,498,562; potatoes, 407,082 acres, 26,867,412 bushels, \$15,851,773; hay, 5,013,987 acres, 6,718,743 tons, \$70,748,364; tobacco, 8040 acres, 10,050,000 pounds, \$1,005,000.

Nine silk mills, three woolen mills, one cotton mill, and seventeen knitting mills were built in the State during 1902. Only Pennsylvania built more knitting mills. The production of pig iron increased over 40 per cent.—from 283,662 tons in 1901 to 401,369 tons in 1902. New York produced in 1902 10,467,784 barrels of malt liquors—about twice as much as any other State.

Railroads.—In 1902 there were in New York 8131 miles of main track and 15,033 miles of single track. In 1901 there were 14,807 miles of single track. The gross earnings from operation for the aggregate mileage of all systems in the State for 1902 were \$293,347,453; the operating expenses were \$204,775,365. In 1901 the figures were respectively \$276,676,101 and \$190,375,619. The total number of employees in 1902 on the several systems were 199,373; in 1901, 184,854.

Legislation.—The legislation enacted by the New York State legislature for 1902 was largely suggested by the governor in his annual message for that year. In two instances, however, the governor failed to carry out his programme. His recommendation to put a tax of 5 mills on mortgages, thus increasing the State revenue by \$3,000,000 per annum, was rejected by the legislature; as also his proposal to submit to the people the question of enlarging the Erie Canal. Yet in the main, the governor accomplished his purposes. In his message he estimated that the entire revenues derived from indirect taxation would probably make the gross income for the current fiscal year from corporations, banks, and insurance companies, \$6,100,000, as compared with \$2,981,286.66 for the preceding fiscal year. As the income from indirect taxes has been increased, State expenditures have been decreased. As a result direct taxes have been decreased until for 1903 they are estimated at \$748,000, as against \$10,704,153.39 in 1900. Another important measure was the Krum bill, greatly enlarging the field of investments for savings banks. Bills were also passed looking toward the construction of permanent good roads. The congestion of legal business in the courts of New York and Kings counties led to a law providing for the appointment of a commission of seven persons to examine into the condition of business in the above-named courts and to suggest such measures of legislation as they deem necessary to expedite such business. Provision was also made for the shortening of the term of appeal in case of a murder trial. On April 3, 1902, Governor Odell signed the bill for the repression of anarchy. The law imposes a penalty of not more than two years' imprisonment or a fine of not more than \$5000 or both on persons teaching anarchistic doctrines. It is made a misdemeanor punishable by a fine of not more than \$2000 or by imprisonment for not more than two years, or by both, to publish books, newspapers, etc., anarchistic in nature; and the same penalties are provided for owners, agents, or occupants of houses harboring avowed anarchists.

Legal Decisions.—On November 11, 1902, in New York City a verdict of acquittal in the Molineux case brought to a close one of the most remarkable murder trials in the annals of the American criminal bar. The trial, or more properly, the series of trials brought to convict the prisoner, had lasted from early in 1899, had as was estimated cost the State some \$400,000 and the defense \$100,000, and had caused a final ruling by the New York Court of Appeals on some vexed and important questions of criminal evidence. The Court of Appeals in July rendered a decision denying the right of privacy to a young lady of Rochester, who, in 1901, had brought suit against two firms for unauthorized use of her portraits as an advertisement on flour barrels. The court's decision was that "the so-called right of privacy has not as yet found an abiding place in our jurisprudence."

The Raines Law.—Early in the year State Excise Commissioner Cullinan made reply to a number of current criticisms regarding the Raines law and its administration. Summarized, his reply was that the law produces an enormous public revenue, aggregating in five years \$73,000,000; the number of liquor dealers at the beginning of 1902 was only 26,000, against 33,000 when the former law expired in 1896; granting licenses to all who pay the tax, unless they have previously violated the law, has stopped the "injustice, favoritism, corruption, partisanship" and other

evils which reigned when licenses were granted at the discretion of an excise board; furthermore "the act provides in explicit terms two means for the enforcement of the liquor tax law, one of which is the civil remedy to be exercised by the State authorities and the other is the criminal remedy, exclusively under the control of the local criminal authorities." In connection with the excise question in New York, an organization known as the Anti-Saloon League of New York State, in January made public a proposition offered with a view to the amelioration of existing conditions. The league proposed to extend the local option of the State to all cities by election districts and to take from hotels the privilege of selling on Sunday, with the object of closing resorts fictitiously called hotels. The Reform Club, of New York, after an exhaustive discussion of the subject, announced as their view that the best present solution of the problem would be the adoption of the local option scheme. Eminent clergymen of the city, including Bishop Potter and Dr. Rainsford, assumed a different attitude toward the question, demanding the legal opening of saloons during certain hours every Sunday. Dr. Lyman Abbott expressed an opinion to the effect that the question of Sunday opening should be made a matter of local option by wards. A majority of the clergy of Greater New York are strongly of the opinion that the Raines Law, which, if effectively enforced, requires absolute Sunday closing, should be strictly carried out. Mayor Seth Low and his commissioner of police, Colonel Partridge, by their publicly expressed opinions and their acts during the year conveyed the impression that they did not believe the Sunday closing law capable of complete enforcement. At the same time, they think it possible to hold the evil in check and to stop the levying of blackmail. Throughout the year, under the Low administration, the saloons kept their front doors closed on Sunday and maintained outward quiet and order.

Tunnel Franchises.—Mayor Low and the Rapid Transit Commission, after giving approval to a proposed ordinance granting a perpetual franchise to the Pennsylvania and Long Island railways for a tunnel under the North and East rivers connecting their lines and traversing Manhattan Island in New York City, discovered that the Board of Aldermen presented strong opposition to its passage. They gave as reasons, first, their unwillingness to grant a perpetual franchise which might establish a perpetual monopoly; secondly, their hostility to any franchise which did not stipulate that construction work should be performed under the eight-hour day and paid for at the prevailing rate of wages; thirdly, their wish that the subways should contain pipe galleries in which gas mains, water mains, electric wires, etc., might eventually be carried, and, fourthly, their anxiety lest the export business of New York City proper might suffer by the introduction of a system which might establish terminals at the extremity of Long Island. The Rapid Transit Commission, on their part, in reply to these objections, stated that the franchise proposed was not a perpetual franchise in reality, as it provided for a revaluation every 25 years and a readjustment at the expiration of those periods of the company's payment to the city. The commission announced that the railroad would not construct the proposed tunnel without such a franchise, and declared that the city could not construct it and lease it to the railroads as the municipal authorities could not obtain title to land on the New Jersey side of the North River. It was also pointed out that the courts had decided, with reference to the eight-hour system and the prevailing rate of wages, that the city contracts could not constitutionally be limited in such a way. The Board of Aldermen rejected the proposed ordinance and in December a revised ordinance was resubmitted. With it the mayor sent a message reinforcing his arguments on the measure and stating that the administration had made every effort to secure the changes in the charter desired by the board, with a result that somewhat better terms had been obtained. After considerable discussion and a plea for delay on the part of those who opposed the franchise, the ordinance was passed, December 16, by a vote of 41 to 36, four Tammany aldermen and several Brooklyn Democrats voting for it and only two Republicans against it. The preliminary work of the tunnel was taken up in earnest immediately after the decision of the Board of Aldermen had been announced.

New York and New Jersey Railroad Franchise.—During the consideration of the Pennsylvania Railroad tunnel project, the Board of Aldermen passed an ordinance granting to the New York and New Jersey Railroad Company the right to complete the tunnel begun several years ago by the Hudson Tunnel Railway Company. By the provisions of this franchise, electric cars will run every half-minute, connecting the New Jersey terminals of the Erie and Lackawanna roads with the elevated and surface railroad system in New York. The ordinance contained no restrictive clauses as to labor. It provided for a reassessment of the value of its privileges, at the end of 25 years, and stipulated that the city should receive from 3 to 5 per cent. of the estimated receipts. The ordinance was passed and was signed by the mayor late in December.

Assessments.—Mayor Low, in October, referred for the second time since his inauguration to the question of property assessment. In his second statement he defended the policy he had advocated, requiring property to be assessed at its true value, this being the letter of the law. According to the State Constitution the city of New York is prohibited from issuing bonds in excess of one-tenth of the assessed value of the property within it. The mayor pointed out that something must be done to meet existing conditions. "All public improvements except school buildings, and all local improvements, must shortly stop; or the State Constitution must be amended so as to enlarge the city's credit; or the city's real estate must be assessed at full value, as the law directs." The mayor's plan was adopted in connection with the assessment of property for 1903. Many took advantage of the rebate allowed to persons paying before January 1 and settled their 1903 taxes in December, 1902.

The New York City Budget.—The budget estimates for New York City, 1902, prepared by Mayor Low, show public expenditures for the year at \$98,600,000. The principal items are, in round figures, as follows: Interest on city debt and sinking fund payments, \$23,000,000; education, \$19,000,000; police, \$11,000,000; street cleaning and fire service, \$5,000,000 each; and charities, including hospitals, \$5,000,000. The aggregate is about \$600,000 more than the tentative budget prepared by Mayor Low's predecessor, but this is accounted for by items and arrearages running over from 1901. The appropriations were increased in Mayor Low's estimate for the fire department and for hospitals and other charities. To offset this increase deductions of nearly \$500,000 were made in salaries.

The Tammany Leadership.—Richard Croker, who led the Tammany forces during the campaign of 1901, declared his intention of retiring from politics shortly after the defeat of his plans. Lewis Nixon, a member of Tammany and a well known shipbuilder, was named by him as his successor. He began his administration by placing the control of Tammany's general committee in the hands of members elected by the voters in the several districts instead of members appointed by a clique. The announcement of this policy was greeted with applause by the better element of voters. In other directions Mr. Nixon demonstrated his desire to reform his organization thoroughly. Events proved, however, that the task he had undertaken was less hopeful than he had anticipated. Finally Mr. Nixon resigned, saying he could not retain his "self-respect and remain the leader of the Tammany organization; that his administration had been hampered by a 'kitchen cabinet'; that every important act of his was cabled to Mr. Croker before it became effective, and that he received orders to place certain men."

The members of Tammany received the resignation coolly and accepted it. Mr. Croker promptly denied, by cable, any interference with Mr. Nixon and declared his intention of remaining out of politics. Several changes were subsequently made in the organization of Tammany Hall, and a triumvirate consisting of Messrs. Murphy, MacMahon, and Haffen, was chosen as a sort of board of control. This experiment did not prove successful. After the election in November Charles F. Murphy, one of the triumvirate, gained recognition as leader of the organization and his sway promised to become almost as absolute as that of Mr. Croker.

Disasters and Casualties.—A storm of snow and rain swept over New York City February 21, 1902, flooding the streets and breaking down telephone and telegraph wires. Traffic was suspended and the street cleaners refused to work at night. The fall of snow was greater than in any winter since the blizzard of 1888. While the storm was still in progress, on the morning of the 22d, the armory of the Seventy-first Regiment took fire and, with its contents, was utterly destroyed. The sparks from this fire were alleged by witnesses to have started the fire at the Park Avenue Hotel, which caused the death of twenty-one persons and the injury, by burning and otherwise, of a much larger number. During an investigation which followed, there was much dispute and conflicting testimony as to the cause of the fire. According to the preponderance of evidence, the conflagration originated from sparks blown from the burning armory. This view was held by the fire marshal at the coroner's inquest, and was set forth in the verdict of the coroner's jury. On the evidence of guests of the hotel and of members of the fire department, the jury also found that the hotel was not properly equipped for the safety of its occupants. One result of this calamity was a widespread demand for better protection and more strict observance of legal requirements in the construction of so-called "fire-proof" buildings. On December 26 fire destroyed the Arbuckle sugar refinery in Brooklyn and several adjoining factories. Six firemen were buried beneath the walls. The estimated loss was \$500,000. On the night of November 4 a terrible explosion of fireworks occurred in Madison Square, where thousands of people had crowded to read the election returns and watch the fireworks. Twelve people were killed and more than eighty more or less seriously injured. On the

morning of January 8 a suburban train from New Rochelle on the New Haven road, filled with people on their way to business in New York City, while standing on the tracks near the lower end of the Park Avenue tunnel, was run into by another suburban train coming from White Plains over the Harlem road. The rear cars of the New Rochelle train were demolished, fifteen people were killed and thirty-six injured, two of whom died within a few hours. The verdict of the coroner's jury found the officials of the New York Central road responsible in neglecting to insure the proper measures for safety.

Dynamite Explosion.—At noon on January 27 a terrific explosion of dynamite occurred in front of the Murray Hill Hotel, Forty-first Street and Park Avenue, New York City. Five persons were killed, hundreds of others were injured, and damage to the amount of over \$1,000,000 was done to property in the neighborhood. The Murray Hill Hotel was partially wrecked, and windows were shattered in the Grand Union Hotel, the Grand Central Station, the Manhattan Eye and Ear Hospital, and many other buildings. People were thrown down in the street and the report was heard miles away. The dynamite had been stored for use in work upon the Rapid Transit Tunnel. No great damage was done to the subway, so that the contractors were able to resume work promptly. Major Ira A. Shaler, a sub-contractor, and two of his assistants were arrested, and were held responsible by a coroner's jury. Afterwards the grand jury indicted Major Shaler and six others for manslaughter. Major Shaler was killed by a falling rock soon after. None of the cases reached trial during the year.

Boycott of the Jewish Butchers.—In May, in the Jewish quarter of New York City, an agitation was carried on against the "Kosher" butchers, whose meat is inspected and certified by the rabbis in accordance with the Mosaic law. These retail butchers were accused by their customers of taking advantage of the fact that they practically had the orthodox Jews at their mercy and made their own prices. The agitation took place at the time when the price of beef and other meats had been increased throughout the country by the alleged operations of a trust. The "Kosher" butchers aroused the anger of the Hebrew community by increasing the retail price of certain meats to the extent of three cents a pound when the extra price paid by these dealers to the firms from which the meat was purchased was only one-quarter of a cent. The Jewish women led the movement against the butchers. They boycotted them, persuaded others to do the same, scattered pickets throughout the districts affected and issued circulars in which they urged those who sympathized with them not to buy meat themselves nor to let others buy. The women went so far as to seize the meat purchased by those who refused to join with them, and threw it into the streets or poured oil upon it. The agitation culminated in rioting, several thousand Jewish women taking part. The police found themselves unequal to the emergency on one or two occasions. During one disturbance six hundred arrests were made. No serious personal injuries were suffered, but a number of noisy demonstrations were continued until the agitators had gained concessions from the butchers.

Jewish Funeral Riots.—During the first week in August the funeral of Rabbi Joseph, well and favorably known among the Hebrews of the East Side in New York City, took place in the presence of many thousands of spectators, many of whom had known the deceased personally and mourned his death. It was estimated that fully 50,000 mourners followed the body in a procession through the thoroughfares most frequented by the Hebrew population. As the procession was passing the printing-press factory of Robert Hoe a disturbance began, said to have been started by some of the factory employees. Many of the factory windows were broken and the crowd attempted to force their way into the building with the intention of wrecking it. The factory workmen turned the fire hose on the assailants and drove them back. A number of persons were injured and it was with the greatest difficulty that the police restored order. During a subsequent investigation, made at the request of Mayor Low, it was ascertained that for a long time prior to the outbreak there had been a strong feeling of antagonism between the factory employees and the Jewish element residing and working in the neighborhood. The police commanders having the district in charge were severely criticised for seeming mismanagement and neglect in permitting such a large body of people as were present at the funeral to pass through the streets without a suitable escort of the uniformed force.

The New Primary Law.—In September, an election of district members of the party committees in New York City, under the new primary law, demonstrated the fact that illegal voting can be controlled when the proper authorities work in harmony. State Superintendent of Elections McCullagh, after the election, reported that 90 per cent. of the illegally registered voters lacked courage to offer their ballots. On the other hand there was ample evidence that the provision of the law, which requires a residence in a voting precinct of thirty days to gain the right

to vote, was unscrupulously violated by colonizers in the closely contested districts. In the Ninth district, in which three contestants, J. C. Sheehan, F. J. Goodwin, and W. S. Devery were candidates for the Democratic leadership, the campaign was the most picturesque and enthusiastic contest seen for many years. By a judicious application of beer, barbecues, and picnics to the voters of the district, their wives and children, Devery succeeded. It was reported that he spent \$50,000 in the contest. His attempts later to gain recognition in Tammany Hall were not so successful and he was denied a seat in the Democratic State convention. The results of the primaries indicated that at least a third of the legal voters did not take sufficient interest in them to vote.

Conventions and Platforms.—The Republican State convention was held at Saratoga September 24. Among the most important acts of the convention in State affairs was the changing of the candidate for lieutenant-governor, Mr. Frank W. Higgins being substituted for Mr. Sheldon, owing to the mention of the latter's name in connection with certain trusts with which he was said to have business relations. This caused some comment as indicating Governor Odell's dominance in the Republican party of the State, Mr. Sheldon being, it was said, the choice of Senator Platt. An important State plank in the platform was that urging canal improvements and good roads, but suggesting that expenditures therefor should be deferred until the constitution was amended to admit of the issuance of long-time bonds to pay for them. In national affairs the platform gave President Roosevelt the party's cordial support and favored his election to the presidency in 1904; condemned all combinations and monopolies that tended to destroy competition, limit production or increase cost of necessities, and favored such legislation as would suppress and prevent their organization; indorsed the administration policy in the Philippines; favored reciprocity with Cuba; declared that the integrity of the protective principle must be preserved, and praised the successful administration of Governor Odell, mentioning particularly the material reduction in the direct taxes.

The Democratic State convention, held at Saratoga on October 1, was under the control of ex-Senator David Bennett Hill and the conservative reorganizers. One of the most widely discussed acts of the convention was the refusal to recognize William S. Devery, former chief of police of New York City, as leader in the Ninth Assembly district of that city. The most conspicuous plank in the platform was the demand for government ownership of the anthracite mines, which, as indicating a "socialistic attitude" caused much comment. The platform condemned unsparingly the refusal to grant Cuba proper tariff concessions and demanded a substantial reduction of tariff, and not the mere 20 per cent. which the President professed a willingness to grant; condemned trusts, mentioning especially the beef and coal trusts; demanded the reduction of the tariff to a revenue basis; declared the policy of reciprocal trade to be the traditional Democratic policy; condemned the Philippine policy of the administration, saying that the purpose of the nation as to the ultimate government or disposal of the islands should be in harmony with American traditions and should be explicitly declared; favored the election of United States senators by the people; and arraigned in some detail the Republican administration of the State. The convention nominated Bird S. Coler for governor and C. N. Bulger for lieutenant-governor.

Elections.—At the State elections, held November 4, 1902, the entire Republican State ticket was elected except the attorney-general. The vote for governor was: Odell (Rep.), 665,150; Coler (Dem.), 656,398, giving Odell a plurality of 8803 votes. The election was of unusual interest, centering around the State policy of Governor Odell and the national policies of President Roosevelt. Resentment toward what was generally believed to be unwarrantable interference on the part of the Republican legislature at Albany with the affairs of the city exerted a tremendous influence over the result in New York City, which returned a plurality of 122,000 for Coler. Up the State the feeling was strongly in favor of Odell, largely because of his tax measures, which were expected to relieve the rural districts at the expense of New York City. The Democratic candidate for attorney-general, John Cunneen, the nominee as well of the Prohibition party, was elected.

State Officers—For 1903: Governor, Benjamin B. Odell, elected for two years, term ending January, 1905; lieutenant-governor, F. W. Higgins; secretary of state, J. F. O'Brien; treasurer, John G. Wickser; attorney-general, John Cunneen; comptroller, Nathan L. Miller; engineer and surveyor, E. A. Bond; superintendent of banks, F. D. Kilburn, three years, term ending May, 1905; insurance commissioner, Francis Hendricks, three years, term ending February, 1903; superintendent of public instruction, Charles R. Skinner, three years, term ending April, 1903; superintendent of State prisons, Cornelius V. Collins, five years, term ending April, 1903; commissioner of agriculture, Charles A. Wieting, three years, term ending April 29, 1904—all Republicans, except Cunneen.

Court of Appeals for 1902 and 1903: Chief justice, Alton B. Parker; associate

justices, John Clinton Gray, Denis O'Brien, Edward T. Bartlett, Albert Haight, Celora E. Martin, Irving G. Vann, Edgar M. Cullen, and William E. Werner.

For Congressional representatives, see UNITED STATES (paragraph Congressional Representatives).

NEW YORK PUBLIC LIBRARY, ASTOR, LENOX, and TILDEN FOUNDATIONS, was consolidated in 1895. It maintains two reference branches, at the Astor Building, 40 Lafayette Place, and the Lenox Building, 890 Fifth Avenue, and, in 1902, had thirteen circulation branches in various parts of the city, of which six occupy their own buildings. During that year the St. Agnes Free Library, with 10,027 volumes, and the Washington Heights Free Library, with 19,425 volumes and a fine building, were consolidated with the library as branches. The four reading rooms that had been opened in public school buildings in 1901 were closed on January 1, 1902, owing to lack of funds by which the board of education could continue their support, and their books and periodicals were distributed among the branch libraries. On March 26, 1902, the number of sites permitted to be selected for Carnegie libraries was increased from not to exceed 42 to not to exceed 50, in order to provide for additional libraries in the boroughs of Richmond and the Bronx, and the increase was approved by Mr. Carnegie. Of these sites eight had been acquired or contracted for up to October 1. From October 1, 1901, to October 1, 1902, 2,014,653 volumes were issued for home use, an increase of 151,685 over the preceding year. Of this increase, 99,920 were due to the traveling libraries, which circulated 248,791 volumes. The number of distributing agencies during the same period was 202, as against 156 the preceding year. The total number of books in the circulation department was 218,818, of which 15,986 were added during the year. The accessions to the reference department were 32,224 volumes, of which 16,464 were gifts, and 24,317 pamphlets, including 17,563 gifts. The total number of volumes on the shelves and available for use at the end of June, 1902, was 571,081, and of pamphlets 206,687. The number of readers and visitors at the two reference library buildings was 165,011, the Astor having received 111,199, and the Lenox 53,812, an increase of about 21,000 over the preceding year. The volumes and periodicals issued to readers in both buildings, not including the use made of the open reference shelves, were 411,883, an apparent decrease of 200,000, due to the change in the methods of keeping statistics in the Astor branch. There were added 12,512 prints to the collection. Among the gifts of the year were the Sterne collection of 2375 volumes and 2442 pamphlets, mainly on economic subjects, from library of the late Simon Sterne; the library *Americanus* given by Henry Baldwin, of New Haven, including 1000 volumes, 5000 pamphlets, and a series of scrapbooks; and a bronze bust of George William Curtis, the work of J. Q. A. Ward.

NEW YORK STATE SUNDAY SCHOOL ASSOCIATION. See SUNDAY SCHOOL ASSOCIATION, NEW YORK STATE.

NEW YORK UNIVERSITY, in New York City, founded in 1831. The attendance in 1901-02, excluding names counted twice, was 2101, distributed as follows: College 256, graduate school 187, applied science 115, pedagogy 358, commerce 126, summer school 113, law, 665, woman's law class 36, medicine 300, veterinary 55. The faculty was composed of 212 professors and instructors. The gross income for 1902 was \$467,839. During the year the school of commerce increased its curriculum from two to three years, the additional courses covering law, finance, administration, and practical accounting. In the graduate school a thesis was added to the requirements for the master's degree, and the hours for all degrees in the graduate school were doubled, making the requirements six hours of work and a thesis for the master's degree, and twelve hours of work and a thesis, which must be printed, for the doctor's. The new degree of Juris Doctor was added in law, to be given to college graduates only who complete a three-year course covering fourteen hours each week. The university in June, 1902, gave the honorary degree of L. H. M. to five of the women who serve on the advisory committee of the woman's law class. Twenty-four candidates in the school of commerce received the new degree of bachelor of commercial science.

NEW ZEALAND, a British colony in the Pacific Ocean, 1200 miles southeast of Australia. The capital is Wellington.

Area and Population.—The estimated area is 104,471 square miles. According to the census of March 31, 1901, the population was 815,820, of whom 43,101 were Maoris and 2857 Chinese. On March 31, 1902, the European inhabitants numbered 789,994. The Cook Islands, annexed to the colony in 1900, have a population of about 8000 natives and 200 Europeans. The majority of the inhabitants of New Zealand are Protestants. Primary education is free and compulsory. In December, 1901, there were 1677 public primary schools, with 131,351 pupils, 309 private schools, with 15,344 pupils, and 91 village schools for Maoris.

Government and Finance.—The colony is administered by a governor (the Earl

of Ranfurly since 1897), who is advised by a responsible ministry of eight members. The legislative power devolves upon a Parliament of two houses, the Council (45 appointed members) and the House of Representatives (74 elected members). Woman's suffrage obtains, but a woman is not eligible to a seat in either house of parliament.

The principal source of revenue is customs, and the largest item of expenditure interest on the public debt. Revenue and expenditure for fiscal years ending March 31 have been reported as follows: 1900, £5,699,618 and £5,140,127; 1901, £5,908,697 and £5,479,704; 1902, £6,152,839 and £5,895,915. The net public debt on March 31, 1902, was £51,837,631.

Industries, Commerce, etc.—The principal industries are agriculture and sheep raising. The leading crops are wheat, oats, and barley. Gold mining is important. In the fiscal year 1900 imports and exports were valued at £8,739,633 and £11,938,335 respectively; 1901, £10,646,096 and £13,246,161; 1902, £11,817,915 and £12,881,424. The larger part of the trade is with Great Britain. In the fiscal year 1901 the leading imports were: Clothing materials and clothing, £2,420,241; iron and steel goods, machinery, etc., £2,133,219; sugar, £451,522; paper, books, etc., £107,410. The principal exports were: Wool, £4,749,196; frozen meat, £2,128,881; gold, £1,439,602; grain, pulse, and flour, £1,049,399; butter and cheese, £969,731. In March, 1902, there were in operation 2235 miles of government railway and 88 miles of private lines.

History.—The New Zealand parliament was opened on August 1, 1902. The governor stated that in the Anglo-Boer war New Zealand had furnished 6700 officers and men and 6620 horses. He announced that the Commonwealth of Australia had agreed to admit New Zealand letters at the penny rate, thus making the penny system general within the empire. He announced that the legislation for creating a system of Maori councils had been favorably received and promised to be successful; that the administration of the Cook Islands was proceeding satisfactorily, and that the natives seemed perfectly contented; that the government contemplated appointing commercial agents in Great Britain, Africa, and Australia with a view to increasing the markets for the produce of the colony; that the state coal mine recently purchased would soon be in working order; that the Referendum Bill which passed one branch of the legislature at the previous session together with a new measure providing for a system of state fire insurance, would be introduced; and that the legislature would be asked to consider measures making provision for aged and retired officers in the railway service, and for preventing combinations by which the prices of food supplies are improperly raised. The governor stated that notwithstanding the heavy and unusual items of non-recurring expenditure and the large reductions made in railway charges, customs, and postage, there would be a substantial credit balance at the end of the year on account of the large increase of traffic and other business. The budget statement showed that the public debt had been increased during the year by £3,370,000, and that a new loan of £1,750,000 was proposed for public works. The total expenditures on public works for the year amounted to £2,143,200, while the estimates for the ensuing year amounted to £2,193,000. Some of the items under the latter head are £743,000 for railway construction, £335,000 for roads and bridges, and £288,000 for public buildings. In December, 1902, it was announced that the public-works policy had come to a standstill for want of funds, but relief was soon expected from the new loan which had recently been floated in London. Meanwhile the government discharged large numbers of laborers engaged on the public works, and otherwise pursued a policy of economy. It was admitted that the expenditure for public works had gone beyond legitimate bounds, and that much of it was wasteful. Dissatisfaction was expressed with the cooperative system, which, it was said, was proving a costly one to the colony by inflicting upon the taxpayers incompetent and inefficient workers. Evidence of this recently came to light in connection with a strike of government cooperative laborers—the only strike that has occurred in New Zealand for years. The affair grew out of the act of the government in putting cabmen and other incompetent employees from the cities in the railway service to work with competent men. Early in October, 1902, the parliament was prorogued. No important legislation was enacted during the session. The scheme of compulsory state fire insurance introduced by the government was regarded as impracticable, and the bill was dropped. The general elections, held November 25, 1902, resulted in a victory for the government, which secured 45 seats, the opposition gaining 25 and the independents 5. The question of continuing, reducing, or refusing licenses to sell liquor was submitted to the voters, and as a result of the women's vote the prohibitionists won in a number of districts. The total vote was: for continuing licenses, 146,291; for reducing the number of licenses, 130,145; for no license, 149,585.

Considerable dissatisfaction has been expressed with the workings of the compulsory conciliation laws. Many of the cases dealt with by the boards have been taken to the court of arbitration. It is asserted that valuable time is lost by suitors

before the conciliation board when there is an expressed determination by one party to disregard the recommendation of the board and proceed to the court. The friends of the measure admit that it has failed to lessen the previously existing antagonism between employers and employees, although they claim that it has banished strikes.

NICARAGUA, a Central American republic between Honduras and Costa Rica. The capital is Managua.

Area and Population.—The total estimated area is 49,200 square miles. The population, including uncivilized Indians, was estimated in 1900 at about 500,000. The inhabitants are mostly Indians, mestizos, mulattoes, and negroes.

Government and Finance.—The chief executive authority is vested in a president elected by popular vote for a term of four years. The president in 1902 was Señor José Santos Zelaya, who was inaugurated for his third successive term on February 2 of that year. The legislative power devolves upon a congress of one chamber elected for two years. The active army numbers 2000 men.

The monetary standard is silver, and the unit of value the peso, worth 42.8 cents on October 1, 1901, and 38.4 cents on October 1, 1902. The paper peso, the chief circulating medium, is depreciated. Revenue accrues chiefly from customs and excise. Estimated revenue and expenditure for 1900 were 6,408,000 pesos and 5,780,920 pesos respectively, and for 1901, 5,760,920 pesos and 5,758,923 pesos respectively. In July, 1901, the external debt stood at \$1,332,934.

Industries, Commerce, etc.—The principal industries are cattle-raising and agriculture, and the leading crops are coffee and bananas. The estimated coffee crop in 1902 amounted to about 30,000,000 pounds. Imports and exports for 1900 are reported at 5,516,523 pesos and 6,289,483 pesos respectively. Trade is chiefly with the United States, Great Britain, France, and Germany. The railway between Managua and La Paz, 35 miles in length, connecting the two sections of the Central Railway, was completed in June, 1902, at a cost of about 32,000 pesos a mile. This line does away with transshipment at Momotombo. The length of the entire line is 160 miles.

By a presidential decree of May 28, 1902, the raising of a fund was authorized, by direct taxation on male citizens, for the construction and repair of public roads, which have always been in bad condition. In August, 1902, the government put into effect a law of June 30, 1901, regulating and defining labor in its relations with capital. The purpose of the law was to enforce steady employment and thus prevent idleness and viciousness, and to do away with the custom of employers to advance wages to laborers on a contract.

During 1902 there was considerable friction, which even threatened serious hostilities, between Nicaragua and Colombia. The trouble came about by reason of the disposition on the part of Nicaraguans to lend aid to the Colombian rebels.

NICARAGUA CANAL. See ISTHMIAN CANAL.

NICKEL. See MINERAL PRODUCTION.

NIGERIA, comprising the two British protectorates, Northern Nigeria and Southern Nigeria, extends from the eastern part of the Gulf of Guinea northward to the French Soudan. Its area is variously estimated at from 350,000 to 500,000 square miles (probably about 380,000 square miles is most nearly correct), and its population at from 25,000,000 to 40,000,000. In the south the inhabitants are degraded pagan negroes, but in the north are the Mohammedan Hausas and Fulahs, of uncertain ethnology, but comparatively high civilization. The northern boundary of Lagos to the Niger has been delimited. About the end of 1902 the work of delimiting the frontier of Northern Nigeria between the Niger and Lake Tchad was begun by an Anglo-French commission, in continuation of the work begun by the commission of 1900 pursuant to the Anglo-French convention of 1898. In the fiscal year 1901 revenue amounted to £380,894. Imports and exports in that year were valued at £1,297,116 and £1,253,706 respectively. The principal exports are palm-oil, palm-kernels, and rubber. The leading imports are cotton goods, hardware, and spirits. The importation of spirits, however, into Northern Nigeria is prohibited.

Northern Nigeria.—Throughout 1902 the British continued to extend their effective influence in Northern Nigeria, especially in the Lake Tchad region. A force of about 1000 men under Col. T. L. N. Morland occupied Bautshi on February 16, and then proceeded to Gubja and Gajibu. After some sharp fighting he subdued a number of hostile chiefs and established garrisons at Gubja and at Maiduguri, near Lake Tchad and about 20 miles from the German boundary. As the British force advanced, the French, who were in the British sphere and had killed Fad-el-Allah in 1901, retired. It was thought that by this expedition the British occupation of Bornu was made effective, and that the international convention of 1898 would thereafter be more closely observed. Colonel Morland's expedition was noteworthy

for its rapid marches, one march of 108 miles having been accomplished in five days, another of 200 miles in ten days, and another of 200 miles in eight days.

In October, 1902, it became known that the emir of Kano was making extensive preparations for hostilities against the British. It will be remembered that the emirs of Kano, Sokoto, and Gando have not acknowledged British sovereignty, but in the fall of 1902 the emir of Gando openly professed his friendship for the British. At the same time it was necessary to send a British force against the chief of Zaria, whose unfriendliness towards the administration was being fomented by the emir of Kano, which is only about 60 miles distant from Zaria. The change in the attitude of the emir of Gando was particularly gratifying to the British, since he is one of the most powerful Mohammedan rulers in Nigeria, controlling practically one-third of the Hausa states; and since he is under the influence of the emir of Sokoto it was thought that he might persuade that powerful chief to acknowledge British authority. Peace in Northern Nigeria was particularly desired in the latter part of 1902, since the Anglo-French commission was soon to begin its work of fixing the boundary with the French Soudan. But at the end of the year hostilities seemed impending; and an expedition against the emir of Kano was in preparation. About this time word came that the emir of Sokoto had died in October, and that the new emir was better disposed toward the British than his predecessor. In 1902 the seat of administration in Northern Nigeria was established in the newly built town of Zunguru. In that year it was stated that the slave traffic had been reduced to a minimum.

Southern Nigeria.—In December, 1901, an expedition under Col. A. F. Montanaro was dispatched against the Aro tribes for their attack upon Obegu as well as for their inhuman practices. The expedition met considerable resistance and some sharp fighting was reported, but early in the spring of 1902 the campaign was successfully completed. Indeed, in 1902 affairs in the protectorate decidedly changed for the better. Besides subduing the Aros, the British abolished the slave trade and established several new administrative districts and a number of military posts.

NOBEL PRIZES, in accordance with the conditions of the fund left by Dr. Alfred Bernhard Nobel, the Swedish chemist and inventor, were awarded December, 1902, for that year for each of the stipulated objects. The prize in physics was divided between Professors Lorenz and Zeeman, of Holland, in recognition of their work on the subject of radiation; in chemistry, to Professor Emil Fischer, of Berlin, for distinguished researches; in medicine, to Major Ronald Ross, of the Liverpool School of Tropical Medicine, for his investigations in the mosquito-malaria theory; in literature, to Professor Theodor Mommsen, of Berlin, in recognition of his services in historical study; and in the work for the promotion of peace, to Professor Friedrich von Martens, of St. Petersburg, the eminent authority on international law, who was instrumental in bringing about the Hague Conference.

NORMAL SCHOOLS. During the years 1900-1901, the public normal schools of the United States numbered 170, a decrease of two from the previous year, while the number of students decreased from 47,421 to 43,372. Of the total enrollment in normal departments, 1632 were colored, as against 2707 in the preceding year. The number of instructors employed in 1900-01 was 2232, of whom 1269 were women. In the previous year 2171 teachers were employed, 1236 being women. Of the number graduated in 1901, 1583 were men and 7770 women, as against 1851 men and 7221 women for 1900. The amount appropriated by States, counties, and cities, for the support of normal schools during 1900-01 was \$3,068,485, as against \$2,769,003 for the previous year. The number of private normal schools decreased from 134 to 118, and the enrollment from 22,172 to 20,030. The colored students enrolled in private normal schools numbered 2250 in 1899-1900 and only 1293 in 1900-01. The following table shows the number, total attendance and total income of normal schools, public and private in the United States for the school year 1900-01:

NORRIS, FRANK, an American novelist, died October 25, 1902, in San Francisco, Cal. He was born in Chicago, Ill., in 1870, and in 1885 removed with his family to San Francisco. In 1887 he went to Paris to study art, but after two years decided to give up painting for literature; he then returned to the United States and pursued studies at the University of California and later at Harvard. *Yberville*, a story of Spanish life in old California, appeared in 1891, but his first story to attract general attention was *McTeague*, of which he wrote the greater part while at Harvard. It is a striking story of the ultra-realistic style, but is not so pleasing as the no less imaginative *Moran of the Lady Letty* and *Blix*, which shortly followed. At the time of the Uitlander insurrection he visited South Africa as war correspondent of the *San Francisco Chronicle*. During 1896 and 1897 he edited the *San Francisco Wave*, and then joined the staff of *McClure's Magazine* in New York, for which he acted as correspondent in Cuba in 1898. Upon the establishment of the publishing house of Doubleday, Page & Co., he accepted in it the position of literary adviser, which he held until his death. In 1901 appeared *The Octopus*, the first novel of a projected trilogy, the unifying theme of which was to be the course of the wheat through the battles waged over its growth, distribution, and consumption. *The Octopus* was highly praised by some critics and declared to be worthy of Zola, upon whose realism and that of Balzac and some of the Russians, the younger author

seems chiefly to have fed. *The Pit* (1903) is successful as a story of the market, but either because the theme does not offer equal opportunities, or because the author was less intimately acquainted with the ground, it does not quite maintain the level of *The Octopus*. *The Wolf*, if it had been destined to reach completion, although the scene in a famine-stricken town of Europe was yet further from the novelist's grasp, might well, as a powerful narrative, have proved an adequate climax to the trilogy.

NORTH CAROLINA, a South Atlantic State of the United States, has an area of 52,250 square miles. North Carolina was one of the original thirteen States. The capital is Raleigh. The population in 1900 was 1,893,810, and in June, 1902, as estimated by the government actuary, 1,950,000. The populations of the two largest cities in 1900 were: Wilmington, 20,976; and Charlotte, 18,091.

Finance.—The balance in the treasury of the State of North Carolina December 1, 1901, was \$53,786.57. The total receipts during the fiscal year were \$1,024,134.34, the expenditures \$1,866,640.32, and the balance on November 30, 1902, \$111,280.59. The main items of revenue and the amounts derived therefrom were the taxes on real and personal property, \$826,679.11; railroad taxes, \$129,035.01; dividends from railroad stock owned by the State, \$210,014. The total debt at the end of the year was \$6,527,770, of which \$6,289,150 was funded. Owing to the large appropriations made by the legislature in 1901, for the enlargement of insane asylums, and for bringing the public schools up to the constitutional requirements of four months in each district, the State revenue was inadequate to the disbursements, and pending the next meeting of the legislature, the council of State secured a temporary loan of \$200,000. To pay off this floating indebtedness and to continue the improvements begun, a bond issue of \$500,000 was recommended by the governor. The report of the State tax commission, appointed by the legislature recommended means for levies on personal property at its true value, a large amount of which escaped, and that a tax should also be levied for State purposes on distilleries, rectifying establishments, and saloons. Heretofore a tax on saloons had been levied for use of the school fund only. Since the enactment in 1899 of the law taxing insurance companies, there has been collected from the insurance department for 1899, \$92,851.21; for 1900, \$91,072.92; for 1901, \$132,034.03; and for 1902, \$140,000 (estimated).

Agriculture.—The principal field crops for 1902, as given by the *Crop Reporter*, were: Corn, 2,706,682 acres, 37,622,880 bushels, value \$22,573,728; winter wheat, 576,558 acres, 3,055,757 bushels, \$2,811,296; oats, 238,143 acres, 3,024,416 bushels, \$1,542,452; potatoes, 24,890 acres, 1,592,960 bushels, \$1,067,283; hay, 132,135 acres, 190,274 tons, \$2,330,856; tobacco, 219,263 acres, 142,520,900 pounds, \$15,677,304.

According to the Census Bureau there were 2683 cotton gins in the State, which up to December 13, 1902, had ginned 517,068 bales. The remainder of the crop was estimated at 28,232 bales. This would make a total crop of 545,300 bales, worth approximately \$24,538,500. No other State except Texas had so large a yield of rice per acre as North Carolina. The farm animals in the State January 1, 1903, as reported by the Department of Agriculture comprised 162,438 horses, valued at \$11,558,399; 138,048 mules, \$11,808,815; 201,460 milch cows, \$3,990,923; 307,772 other cattle, \$3,029,152; 220,682 sheep, \$395,749; and 1,071,154 swine, \$5,482,460. A notable movement was the investment of Northern capital in many of the textile mills. Seven cotton mills with 103,000 spindles and 3248 looms, and four knitting mills were built in 1902.

Conventions and Platforms.—The Democratic State convention was held at Greensboro on July 16. In the platform the people of the State were congratulated on the adoption of a suffrage amendment to the constitution, and the party pledged itself to secure a fair and just system of taxation, also the improvement of the free public school system and the main roads throughout the State. The Kansas City platform was reaffirmed, the trusts and the tariff were denounced, and a call was made for primary elections to nominate United States senators. The creation of an Appalachian park was urged.

The Republican State convention was held at Greensboro on August 28. The platform indorsed President Roosevelt, called for greater indulgence toward ex-Confederate soldiers, and denounced the Democratic State administration. It said, furthermore: "We declare that when the constitutional amendment was adopted by the people of North Carolina, two years ago, it passed out of the realm of politics, and that if Governor Aycock, Senator Simmons and others keep faith with the people in the pledges then made, there can be no such thing as a race issue in the present campaign."

Elections.—At the regular biennial State election, held November 4, 1902, the officers voted for were chief justice of the Supreme Court and superintendent of public instruction. The Democratic candidates were elected by a large plurality, the vote for justice of the supreme court being: Clark (Dem.), 132,239; Hill (Ind.), 71,275, giving Clark a plurality of 60,964. This was the first election held since the

suffrage section of the new constitution went into effect. A disagreement between the white Republicans and the negro Republicans tended to increase the Democratic majority, both by cutting down the Republican negro vote, and by driving negroes into the Democratic ranks. The negroes claimed that they had not had sufficient recognition at the Republican State convention, and gave a lukewarm support to the regular Republican nominees. One remarkable feature of the balloting was the evident growth of an independent sentiment, as shown by a considerable scratching of the ballots. The machine politicians look upon this latter development with considerable anxiety. The shrewdest of them see in it a warning that the doubtful men must be kept off the lists of nominees in future elections. The better element gave indications of a desire to strengthen the growing business interests of the State by supporting men of greater ability and character in politics than has heretofore been the case. A close observer of the political situation declared that, in North Carolina, the present aspect is "better than it has been for years," and that "the prospect of honest and decent politics in the future is good." The State legislature for 1903 will consist of 44 Democrats, 5 Republicans and 1 Independent Democrat in the senate, and 100 Democrats, 17 Republicans and 3 Independent Democrats in the house.

State Officers.—For 1902 and 1903: Governor, C. B. Aycock, elected for four years, term ending January, 1905; lieutenant-governor, W. D. Turner; secretary of state, J. B. Grimes; treasurer, B. R. Lacey; auditor, B. F. Dixon; attorney-general, R. D. Gilmer; superintendent of education, J. Y. Joyner; commissioner of agriculture, S. L. Patterson; commissioner of insurance, J. R. Young—all Democrats.

Supreme Court for 1902: Chief justice, David M. Furches; associate justices, Walter Clark, Walter A. Montgomery, Robert M. Douglas, and Charles A. Cook. For 1903: Chief justice, Walter Clark; associate justices, Walter A. Montgomery, Robert M. Douglas, Henry G. Conner, and Platt D. Walker—all Democrats.

For congressional representatives, see UNITED STATES (paragraph Congressional Representatives).

NORTH DAKOTA, a northwestern State of the United States, has an area of 70,795 square miles. The capital is Bismarck. The Territory of Dakota was organized March 2, 1861, and on November 2, 1889, was divided to form the two States of North Dakota and South Dakota. The population of North Dakota in 1900 was 319,146, and in June, 1902, as estimated by the government actuary, it was 346,000. The populations of the two largest cities in 1900 were: Fargo, 9589; Grand Forks, 7652.

Finance.—The balance on hand in the treasury of the State of North Dakota on January 1, 1902, was \$460,962.35. The total receipts of the treasury during the year were \$2,125,232.24. The main items of revenue were taxes from counties, \$832,319.10; sale of endowment lands, etc., \$598,264.29; fees of departments, \$293,013.23; interest on endowment funds, \$197,815.62; leaseings, etc., \$68,683.36. The total expenditures for the year were \$1,915,785.34, leaving a balance on hand on December 31, 1902, of \$670,499.35. The total debt of the State at the end of the year was \$682,300, all of which was funded. The debt was reduced during the year 1902 by the amount of \$153,000. A permanent sinking fund was established during the year for the retirement of the State debt as it shall become due. The taxes from counties was considerably smaller for 1902 on account of the sale of State lands having delayed the collections from counties. The assessed valuation of the State for the year 1903 was estimated at \$100,000,000.

Agriculture.—The principal field crops of North Dakota for 1902, as given by the *Crop Reporter*, were as follows: Corn, 82,700 acres, 1,604,380 bushels, value \$721,971; spring wheat, 3,954,229 acres, 62,872,241 bushels, \$36,465,900; oats, 766,599 acres, 29,437,402 bushels, \$7,948,099; barley, 501,948 acres, 15,861,557 bushels, \$5,710,161; potatoes, 23,725 acres, 2,491,125 bushels, \$822,071; hay, 135,420 acres, 224,797 tons, \$825,005; flaxseed, 2,160,000 acres, 15,552,000 bushels, \$16,018,560. The amount of flaxseed grown exceeded the yield for all the rest of the United States. According to the Department of Agriculture, the farm animals in the State, January 1, 1903, comprised 358,770 horses, valued at \$25,139,076; 7032 mules, \$567,056; 166,665 milch cows, \$5,478,279; 570,956 other cattle, \$12,788,267; 827,781 sheep, \$2,462,979; and 175,403 swine, \$1,783,849. One of the most notable features of the year was the opening of coal mines throughout the western part of the State. It was known that the entire western half of the State was underlaid with a bed of lignite, but it required the 1902 coal famine to stimulate the invention of profitable methods of extracting it. The production in 1895 was 38,997 tons; in 1901, 166,601 tons; in 1902, 296,800 tons. The value of the 1902 output was approximately \$500,000. It was thought that these beds would be of great value in the development of irrigation in the arid portions of the State. The production of clay products in 1901 amounted to \$76,708.

Conventions and Platforms.—The Republican State Convention was held at Fargo on July 23. The platform included a glowing tribute to President McKinley. The

State administration was indorsed, the attitude of State representatives in Congress was approved and a demand was made for a reform of the primaries.

The Democratic State Convention was held at Fargo on August 1. In addition to reiteration of the principles of the party and an indorsement of previous party platforms, the 1902 platform favored the direct election of United States senators, a primary election law, and equitable taxation of corporations. The Republican party was condemned for being dominated by railroad interests, and government by injunction was denounced.

Elections.—At the regular biennial State election, held November 4, 1902, a full Republican State ticket was elected. The vote for governor was White (Rep.), 31,621, and Cronan (Dem.), 17,566, giving the Republican candidate a plurality of 14,055. The State legislature for 1903 will consist of 117 Republicans and 23 Democrats.

State Officers.—For 1902: Governor, Frank White; lieutenant-governor, David Bartlett; secretary of state, E. F. Porter; treasurer, D. H. McMillan; auditor, A. N. Carlbloom; attorney-general, O. D. Comstock; superintendent of education, J. M. Devine; commissioner of agriculture, R. J. Turner; commissioner of insurance, Ferdinand Leutz; commissioner of public lands, D. J. Laxdal—all Republicans. For 1903: Governor, Frank White (elected for two years, term ending January, 1905); lieutenant-governor, David Bartlett; secretary of state, E. F. Porter; treasurer, D. H. McMillan; auditor, H. L. Holmes; attorney-general, C. N. Frich; superintendent of education, W. L. Stockwell; commissioner of agriculture, R. J. Turner; commissioner of insurance, Ferdinand Leutz; commissioner of public lands, D. J. Laxdal (term expires August, 1903)—all Republicans.

Supreme Court for 1902 and 1903: Chief justice, Alfred Wallin (in 1902), N. C. Young (in 1903); associate justices, N. C. Young (in 1902), J. M. Cochrane (in 1903), and D. E. Morgan—all Republicans.

For congressional representatives, see UNITED STATES (paragraph Congressional Representatives).

NORTHWEST TERRITORIES. A political division of the Dominion of Canada, composed of the following districts: Assiniboia, Saskatchewan, Alberta, Keewatin, Athabasca, Mackenzie, Ungava, and Franklin. The total area is 2,497,427 square miles, and the population, which, according to the census of 1901, was 158,940, is now estimated at 200,000, the influx of settlers during 1902 having been unusually large. Capital, Regina, in the district of Assiniboia. The revenue and expenditure for the year ending December 31, 1901, were \$545,215 and \$544,261 respectively. The trade and commerce of the territories, though as yet only beginning to be developed, were in a more prosperous condition in 1902 than ever before. The exports for the territories and Yukon for the fiscal year 1902 were \$15,267,135, as against \$15,435,612 in 1901; and the imports for the same fiscal year were valued at \$4,511,019 as compared with \$4,259,882 in 1901. The territories are administered by a lieutenant-governor and an executive council of three selected from the assembly, which consists of 31 members elected by popular vote. In the Dominion Senate the territories have two members, and six in the House of Commons. Stock raising and farming were, until 1902, unimportant; but the large increase of settlers during 1902 has changed prospects in this respect, especially in Alberta. In the northwest, including Manitoba, it is officially estimated that there are 570,000 square miles of wheat-growing lands, and 780,000 square miles fit for the growth of barley and oats. A considerable percentage of the 25,000 Americans who have entered Canada during the fiscal year 1902 have settled in the territories, yet the opinion of special inquirers is that 40 per cent. of the actual American immigrants are unrecorded, having trekked directly across the line without giving their names at ports of registry on the railway lines. Yukon, which at the close of 1902 was estimated to have a population of 30,000, had, in 1902, an estimated output of \$14,000,000, as compared with \$24,000,000 for the previous year, and industrial conditions of living in Dawson City are reported to be not so good as in 1901, owing to the overcrowding of the labor market. On May 14, it was announced in Winnipeg that American and Canadian capitalists had purchased 1,100,000 acres of farm lands in Assiniboia and Saskatchewan, and that through this the new Canadian Northern Railway was to run, thence to Edmonton and on to the Pacific Coast. The Haultain government was sustained at the general elections. The enlargement of the Canadian National Park at Banff, Alberta, was provided for at the last session of the Dominion Parliament, so that the entire area thus reserved is 5732 square miles, as compared with the American Yellowstone Park of 3000 square miles.

NORTHWESTERN UNIVERSITY, Evanston, Ill., chartered in 1851. The registration on November 1, 1902, deducting duplicates, was 2875, distributed as follows: College of liberal arts, 686; law, 171; medicine, 605; oratory, 102; dental school, 615; divinity, 152; music, 357; pharmacy, 206; graduate schools, 46. The faculty numbered 285. The total value of the college property was \$6,761,249, and

the income \$1,133,511. The library contained 68,325 bound volumes and 36,000 unbound. On January 21, Edmund Janes James was elected to the presidency, and he was formally installed on October 19-21. The law school, dental school, and school of pharmacy took possession of their new buildings in Chicago in October. During the year the courses of study leading to the baccalaureate degree were rearranged on a more liberal basis, reducing the requirements in languages and inserting a group of sciences and a group of studies including history, economics, and philosophy, from each of which the student is required to select one.

NORWAY, a kingdom of northern Europe, occupying the western portion of the Scandinavian Peninsula, has an area of 124,445 square miles, and a population, at the decennial census of December 3, 1900, of 2,239,880, an increase for the decade of 238,963. Christiania, the capital and largest city had a population (1900) of 227,626. The second city in size was Bergen, with a population of 72,251. The Evangelical Lutheran, the state church, receives an endowment from the state, and its clergy are nominated by the king. There is a well-organized school system, and education is compulsory. The University of Christiania was attended in 1899 by 1400 students.

Government and Finance.—The executive power is vested in the king, who is also sovereign of Sweden. He exercises his authority through a council of state, composed of two ministers of state and seven or more councilors, who are also responsible heads of departments. The legislative authority is vested in the *Storting*, composed of 114 members elected by indirect suffrage, which divides itself for legislative purposes into an upper and lower chamber, known respectively as the *Lagthing* and the *Odelsting*. The reigning sovereign, Oscar II., succeeded to the thrones of Norway and Sweden in 1872. There is a common secretary of foreign affairs for the two kingdoms, and common diplomatic and consular services, but otherwise the countries are entirely independent of one another.

The monetary standard is gold, and the unit of value the krone, valued at 26.8 cents. The revenue and expenditure balanced in 1901 at 99,641,070 kroner, and in 1902 at 97,300,000. The principal sources of revenue are customs (35,000,000), income and excise taxes, and railways. The largest items of expenditure are for state railways, church and education, and army and navy. The civil list amounts to 592,032 kroner. The national debt in 1901 was 228,734,200 kroner.

Army and Navy.—Military service is compulsory, and the army is raised chiefly by conscription, all able-bodied men over twenty-two years old being liable for service. The troops of the line number 900 officers and 30,000 men, although no more than 18,000 men are actually under arms at any one time. The navy, like that of Sweden, maintained solely for coast defense, consists of 4 modern iron-clads, 4 monitors, a number of gunboats, and an effective torpedo flotilla.

Industries, Commerce, etc.—Of the total area of Norway, 75 per cent. is unproductive, 22 per cent. consists of forest lands, and only 3 per cent. is under cultivation. Practically no agricultural products are raised for export, the production being insufficient even to supply the home market. Animal products, however, are important, and constitute the chief item of export. The total value of fisheries in 1899 amounted to 24,291,000 kroner. The forest products are of considerable value, and the recent activity in mining development promises to increase greatly the value of the mineral output, which has hitherto been of little importance. The imports in 1901, consisting largely of food-stuffs, coal, machinery, and textiles, amounted to 287,200,000 kroner, and the exports to 165,100,000 kroner (172,946,400 kroner in 1900). The principal items of export were: Wood and manufactures of wood, 62,400,000 kroner; live animals and animal products, 57,200,000 kroner; and paper and paper products, 10,800,000 kroner. The foreign trade is largely with Great Britain, Germany, Sweden, Russia, United States, and Netherlands. The total length of railways in operation in Norway in 1900 was 1230 miles, all but 111 miles of which were worked by the state. The tonnage of the Norwegian merchant marine, according to Lloyd's Register for 1902-03, was 1,632,757, being exceeded in extent by that of Great Britain, the United States, and Germany only.

A new railway which will run from Mo, 300 miles north of Christiania, to the iron ore fields 18 miles distant, was begun in the spring of 1902. It was planned and constructed by American engineers for a London corporation, and is said to be the first American-built railway in Europe.

History.—On April 16, 1902, Herr J. W. C. Steen, who had been premier of Norway since 1898, handed in the resignation of himself and his colleagues. The king at once called on Herr Berner, president of the Storting to form a new ministry, but he was unable to do so, and Herr O. A. Blehr was then called upon and succeeded in doing so. The ministerial crisis was precipitated as a result of the long existing trouble with Sweden over the question of a separate consular service. Norwegian merchants have for years declared that Swedish consuls were partial to Swedish commercial houses and that this constituted a serious impediment to the development

of Norwegian trade. Herr Steen, who had been the Liberal leader for a decade, was made premier in 1898 on the supposition that he would press Norwegian demands for a separate consular service. This he failed to do, and the dissatisfaction with his policy led to his downfall. In the spring of 1902 a joint Norwegian-Swedish commission, appointed on the initiative of Sweden, to consider the consular question began holding its sessions alternately in Christiania and Stockholm. Premier Blehr announced in October at the opening of the Storting that the joint commission had completed its work, and that negotiations based on its investigations had been opened between the two governments.

The activity of Russia in Finland—the "Russification" of that region—has created no little anxiety in both Norway and Sweden, as the enormous strategic importance it would be to Russia to possess northern Norway and thus obtain a foothold on the North Sea is very evident. That Russian statesmen entertain the hope of some day acquiring this region there can be little doubt. Mr. Edmund Gosse, writing in the *London Times*, says that it is now pretty universally realized in both Sweden and Norway that Russia's evident desire to foment dissensions between the two Scandinavian nations has this purpose, or a similar one in view, and that this realization of a common danger has brought the allied countries nearer together than ever before. They are not willing to allow Russia to play off their "family discords" to the detriment of Scandinavian sovereignty. During the year it was also announced that Björnstjerne Björnson, the leader of the radical political faction in Norway, that has been not only anti-Swedish, but even pro-Russian, had declared himself in favor of the movement looking toward pan-Scandinavian neutrality. His change of position was undoubtedly due to suspicion of Russia's policy in Finland. The movement which has already received the favorable vote of the Storting and the support of Premier Blehr, was thought to be greatly strengthened by the declaration of the Björnson party in its favor.

NOTRE DAME, UNIVERSITY OF, at Notre Dame, Ind., founded in 1842, had, in 1902, a faculty of 70 instructors and 872 students, including 524 in the collegiate and 348 in the preparatory department. The college property was valued at \$2,700,000. The library contained 60,000 volumes. During 1902 all the college buildings were equipped with a new heating system and electricity was substituted for steam power. An electric-light plant, a bakery, and a pharmacy laboratory were completed. The college courses were revised and preparations made for special work in chemistry. A branch was established at Portland, Ore., under the name of Columbia University.

NOVA SCOTIA, a province of the Dominion of Canada, with an area of 20,600 square miles, and a population, according to the census of 1901, of 459,574, as against 450,396 in 1891, an increase of less than 2 per cent. Capital, Halifax; population, 40,787 in 1901. The number of public schools at the end of the fixed year of 1901 was 2387, with a total enrollment of 98,410. The schools are maintained partly by government grants and partly by municipal aid.

Government and Finance.—The province is administered by a lieutenant-governor assisted by a responsible ministry. There are two legislative chambers, a council of 20 members, and an assembly of 38 members elected for five years. In the Dominion Parliament the province is represented by 10 members in the Senate and 18 in the House of Commons. The revenue and expenditure, respectively, for the fiscal year 1901, were \$1,090,229 (\$1,014,123 in 1900), and \$1,088,926 (\$937,261 in 1900) respectively. The liabilities of the province on September 30, 1901, were \$3771.

Industries, Commerce, etc.—Mining is the chief industry, and coal the largest mineral product, being far greater than that of any other Canadian province. In the fiscal year 1901 it was 3,625,365 tons of 2240 pounds each, as against 3,238,245 tons in 1900. The output of gold for the same year was 30,537 ounces, as against 30,399 ounces for 1900. The plant of the Dominion Iron and Steel Company at Sydney, Cape Breton, is rapidly approaching completion. The trade of the province for the fiscal year 1902 was in excess of that of the previous year, the exports being \$14,978,222, as compared with \$12,720,343 in 1901, and the imports \$12,510,752, as compared with \$12,146,882 in 1901. The Nova Scotia legislature was opened on February 13. Reference was made to the loyalty of the province, as manifested on the occasion of the visit of the Prince and Princess of Wales, and to the completion of the Midland Railway. A steamer service along the eastern shore between Halifax and Canso has been decided upon, the Dominion and provincial governments having agreed to subsidize it.

OATS. As stated by the United States Department of Agriculture the world's crop of oats for 1901 was as follows.

COUNTRIES.	Bushels.	COUNTRIES.	Bushels.
United States	736,809,000	Belgium	34,288,000
Russia	624,097,000	Roumania	16,540,000
Germany	485,716,000	Netherlands.....	16,000,000
France	213,604,000	Italy	15,000,000
Austria-Hungary	190,942,000	Spain	12,000,000
United Kingdom.....	175,816,000	Bulgaria	8,000,000
Canada	121,476,000	Africa.....	7,750,000
Sweden	56,971,000		
Denmark	30,000,000		
Australasia	32,110,000	Total.....	2,777,119,000

The crop of 1902 in the principal oat-growing regions of the United States was as follows:

STATES.	Acreage.	Bushels.	Dollars.
New York.....	1,324,564	52,982,560	19,073,722
Pennsylvania.....	1,233,368	45,036,182	15,312,302
Texas.....	896,869	20,837,361	10,195,607
Ohio.....	1,129,192	46,409,791	14,851,133
Michigan.....	1,011,031	40,340,137	13,312,245
Indiana.....	1,371,912	48,565,685	13,598,392
Illinois	4,070,303	153,450,423	42,966,118
Wisconsin.....	2,381,900	95,037,810	28,511,343
Minnesota.....	2,109,223	82,259,697	22,210,118
Iowa.....	4,063,138	124,738,337	31,184,584
Missouri.....	855,882	27,816,165	7,788,526
Kansas.....	941,168	31,529,128	9,458,738
Nebraska.....	1,795,422	62,121,601	15,530,400
United States.....	28,653,144	987,842,712	303,584,852

The division of foreign markets reports the exports of oats in 1902 as follows:

COUNTRIES TO WHICH EXPORTED.	Bushels.	Dollars.	COUNTRIES TO WHICH EXPORTED.	Bushels.	Dollars.
British South Africa.....	3,099,563	1,430,157	Netherlands.....	170,540	69,401
United Kingdom	2,708,394	1,021,288	Germany.....	69,979	26,643
France.....	1,787,712	649,645	Belgium.....	49,957	21,315
Philippine Islands.....	932,262	371,189	Other countries.....	133,117	63,563
Cuba.....	593,007	304,972			
Canada.....	249,795	99,035			
British West Indies.....	196,813	96,030	Total.....	9,971,139	4,153,238

The imports in 1902 amounted to 25,812 bushels (valued at \$12,085), principally from Canada. In studies on the composition of oats the Maine Experiment Station found that there is not so great a difference in the composition of light and heavy oats as has been usually supposed, and that their food value is about the same. Experiments with oats at the Kentucky Experiment Station led to the conclusion that varieties yielding 300 pounds or more of protein per acre and having a protein content of over 17 per cent., are the best for feeding purposes. It was observed that in general the percentage of protein in the dry matter, as well as the quantity of dry matter, increased as the plants reached maturity. In experiments conducted for five years in Germany by Wilfarth and Wimmer to study the effect of potash on oat plants, it was found that by the application of potash the quantity of water transpired per gram of dry matter produced was increased. This is explained by the checking of growth when the potash supply is exhausted while transpiration continues. It was found that under normal conditions 460 grams of water were transpired for each gram of dry matter produced by the entire plant. For each gram of potash taken up by the plant 29 grams of starch were elaborated. The average results show that for each gram of potash contained in the oat plant there were present 49 grams of starch. It is calculated that one kilogram of potash is required to produce 100 kilograms of dry matter in the entire oat plant. At the North Dakota Station it was observed that in 1899 oats required 89 days and 5525.9 heat units to mature, and in 1900, 92 days and 5847.3 heat units. The heat units are found by multiplying the mean temperature of the growing period by the number of days of the same period. The records of this station for a series of years show that oats require in that region from 88 to 102 days to mature. At the experiment station at Ottawa, Canada, the growing of oats after different crops, resulted in the best yields after horse beans. The smallest crops of oats were obtained after millet, flax, and soy beans. At the Ontario Station seed-oats obtained from varieties sent to the Missouri Station four years ago, were compared with seed from the same varieties grown continuously at the former station. The Missouri seed produced the largest

yield, and the Ontario seed the heaviest grain. The results of experiments in continuous seed selection were largely in favor of large, plump seed as regards both the yield and the weight of the grain. Von Seelhorst found that rolling oats about May 1 when the plants were about 15 centimetres high, had a tendency to prevent lodging by retarding the growth of the crop, due to the decrease in nitrification in the compressed soil, and by giving the roots a better chance to take a firm hold. Observations by the same investigator on the relation of different crops to the water content of the soil led to the conclusion that oats are not a suitable crop to be followed by winter cereals on account of the large quantity of plant food removed from the soil and especially on account of the heavy withdrawal of soil moisture. Huntemann, in Germany, found that in grading seed oats by means of a centrifugal machine, the second grade seed in a particular case gave the best returns. This was due to the fact that in the variety under test a large percentage of kernels had attached to them secondary smaller kernels and these combined kernels were thrown by the machine into the first grade (i.e., the heavier) seed, although they did not belong there. On the whole, the selection of seed oats with the machine was found profitable.

OBERLIN COLLEGE, Oberlin, O., founded 1833, had in 1901-02 a total student enrollment of 1492, distributed as follows: Preparatory, 340; college, 580; special, 36; theology, 33; music, 505. The faculty numbered 84. The number of bound volumes in the college library was 69,000, and of pamphlets 110,000. The endowment reached \$1,576,153, and the gross income for the year was \$135,122. Gifts received during the year included \$386,890 for endowment and equipment, and \$13,000 for immediate uses. Rev. Henry Churchill King, D.D., formerly dean of the college, was made president, and entered upon his duties in 1902.

OBOCK, a French colony in Somaliland (q.v.).

OCHILTREE, THOMAS P., a popular figure in American public life, died November 25, 1902, at Hot Springs, Va. He was born in 1840, in Nacogdoches Parish, Tex. At the age of fifteen he enlisted in the Texas Rangers and saw service against the Indians. He fought in the Civil War on the staffs of the Confederate generals, Sibley, Green, and Taylor, won a colonel's brevet, and was made confidential messenger of Jefferson Davis to the Confederate commanders west of the Mississippi. After the war President Grant appointed him United States Marshal of Texas, an office which he soon resigned, however, to manage the *Houston Telegraph*, of which he became editor and proprietor. His election to Congress as an independent candidate, falling as it did in a Democratic stronghold, which he canvassed mainly on horseback, making innumerable speeches, he won by sheer perseverance and strength of personality. Of late years his renown as a story-teller and the soul of geniality was as great in foreign capitals as in the United States. He was once characterized as "colonel by birth, warrior, statesman, journalist, diplomat, promoter, bon vivant, raconteur, and friend of the rich."

ODD FELLOWS, INDEPENDENT ORDER OF, organized in England in 1812, and in the United States in 1819, may be divided into the Encampment Branch, the Chevaliers of the Patriarchs Militant, and the Rebekah Lodges, the last-named being made up of both sexes. There were reported at the annual meeting held in Des Moines, Ia., September, 1902, by the grand secretary of the Sovereign Grand Lodge, 66 Grand Lodges in the United States and Canada; 55 Grand Encampments; 12,792 subordinate lodges; 2780 subordinate encampments; 1,002,272 lodge members; 40 Rebekah assemblies; 5756 Rebekah lodges; 273,653 Rebekah lodge members; of these latter, 139,827 were men, and 233,826 were women. Besides the Sovereign Grand Lodge there were six quasi-independent grand lodges in foreign countries. Total amount expended by the various bodies during the year 1901 was \$3,939,785, out of a total revenue of \$10,782,562. Total expenses, outside of payments on relief account, amounted to \$4,815,508, and the amount invested by subordinate lodges, encampments, and Rebekah lodges was \$29,952,769. The total amount of relief paid by the order up to December, 1901, including the relief payments of six quasi-independent lodges, was \$92,665,214.47. Total revenue for the same period was \$240,430,422.21; the number of initiations since 1830 was 2,544,120 in subordinate lodges; the number of members relieved, 2,565,905; number of widowed families relieved, 256,606, and the loss of membership by death within the same period, 252,354. The total amount expended in relief for the year ending December 31, 1901, was \$4,106,173.88; the number of brothers relieved, 122,276; the number of widowed families relieved, 5659. The amount paid for the relief of brothers, \$3,090,271.07; that paid for the relief of widowed families, \$147,291.16; for the education of orphans, \$86,818.84; and for burying the dead, \$781,792.81. The balance in the hands of the grand treasurer at the date of the annual meeting was \$70,888.42. The next meeting of the Sovereign Grand Lodge will be held at Baltimore, Md., September 21-26, 1903. Grand sire, John B. Goodwip, Atlanta, Ga.; grand secretary, J. Frank Grant, Baltimore, Md.

ODELL, BENJAMIN B., JR., was elected governor of the State of New York for a second term on November 4, 1902. He was born at Newburgh, N. Y., January 14, 1854, and was educated at Bethany College, W. Va., and at Columbia, where he was a member of the class of 1877, but left college before graduating. Settling in his native town he rapidly achieved success in business, and became a leading factor in its commercial and political life. As a political campaign manager, and as chairman of the Republican district committee, he converted his district, which had been considered doubtful politically, into a Republican stronghold. In 1887 he became a member of the Republican State Committee. In 1894 he was nominated and elected to the Fifty-fourth Congress, and in 1896 was re-elected, serving as chairman of the committee on accounts in the Fifty-fifth Congress. He declined a renomination in 1898, and two years previously, having become chairman of the Republican State Committee, he bent all his energies toward perfecting the party organization. It was as a "machine" politician that he was most widely known when, in 1900, he was nominated at the Republican State Convention, for governor of the State, and triumphantly elected. In his administration of the gubernatorial office he showed, instead of the blind partisan subserviency that many had expected of one who had been so closely identified with the "machine," a rather unusual degree of independence, and succeeded in securing legislation involving numerous reforms and economies in the administration of State departments and institutions. His own conception of his new responsibilities in office is well illustrated in the reply he is said to have made to a politician of his party who was expostulating with him for opposing a bill, which, as head of the Republican State Committee, he had strongly urged. "I was acting then," he is reported to have said, "as 'Ben' Odell of the Republican State Committee; I am acting now as Governor Odell, of the State of New York." In 1902 he was renominated, and in spite of the overwhelming Democratic majority in New York City, due largely to local conditions, which almost defeated him, he carried the State by increased majorities over 1900, in most of the counties of the State.

OHIO, an east central State of the United States, has an area of 41,060 square miles. Ohio was formerly a part of the Northwest Territory, and was admitted to statehood in 1803. The capital is Columbus. The population in 1900 was 4,157,545, and in 1902, as estimated by the government actuary, 4,262,000. The populations of the five largest cities in 1900 were: Cleveland, seventh largest city in the United States, 381,768, an increase of 120,415 since 1890; Cincinnati, 325,902; Toledo, 131,822; Columbus, 125,560; and Dayton, 75,333.

Finance.—The balance in the treasury on November 16, 1901, was \$1,226,664.46. The total receipts into the general revenue fund for the fiscal year were \$5,206,170.91; the expenditures were \$5,269,098.42; the receipts into the sinking fund, including the balance from the previous year, were \$804,781.72; expenditures, \$550,212.49; receipts into the State common school fund, including balance, \$2,111,735.80; expenditures, \$1,829,924; receipts to credit of university fund, \$374,720.47; expenditures, \$322,329.58; total expenditures of other State institutions, \$3,148,571.91.

Agriculture and Industries.—The principal farm crops of Ohio for 1902, according to the *Crop Reporter*, were: Corn, 3,200,224 acres, 121,608,512 bushels, \$51,075,575; winter wheat, 2,124,759 acres, 36,333,379 bushels, \$25,796,699; oats, 1,129,192 acres, 46,409,791 bushels, \$14,851,133; barley, 31,703 acres, 1,204,007 bushels, \$501,763; potatoes, 165,252 acres, 15,533,688 bushels, \$6,834,823; hay, 2,768,547 acres, 3,959,022 tons, \$40,382,024; tobacco, 62,949 acres, 55,709,865 pounds, \$3,899,691.

The output of the coal mines was much greater than ever before, largely on account of the demand created by the strike in the Pennsylvania mines. The year's production was approximately 24,700,000 short tons. The production of pig iron increased from 3,326,425 tons in 1901 to 3,631,388 tons in 1902—Pennsylvania alone producing more. Bessemer steel manufactured in 1902 amounted to 2,528,802 tons, against 2,154,846 tons in 1901. Steel works were crowded with orders months ahead. Traffic through the lake ports increased nearly 35 per cent. over 1901, largely on account of coal and iron shipments. Three new woolen mills and two new knitting mills were reported for 1902.

Railroads.—The report of the commissioner of railroads of Ohio for the fiscal year ending November 15 gives 9059 miles, represented by capitalization of \$325,515,901.28, as against 8719.62 miles, represented by a capitalization of \$314,871,305.03, in 1901. The total earnings in Ohio from all sources for 1902 were \$101,001,341.37, as against \$89,699,277.75 in 1901, showing an increase of 12.6 per cent. The percentage of net earnings to gross earnings was 42.42 per cent. The total operating expenses of the roads in Ohio were \$64,953,128.91 in 1902, as against \$61,241,913.91 in 1901, showing an increase of 13.01 per cent. The total number of passengers carried in Ohio during 1902 was 28,499,313, as against 26,510,292 in 1901, an increase of 1,989,021, or 7.5 per cent. The number of tons of freight transported during 1902 was 132,113,976, as against 117,628,852 tons in 1901, an increase of 14,485,124 tons, or 12.31 per cent. The average receipts per ton in 1902 were 54.5 cents, an

increase of 1 cent over 1901. The freight earnings per mile of road were \$6990.13, as against \$5971.35 in 1901.

Legislation.—The 75th biennial session of the legislature convened in regular session on January 6, 1902, and adjourned May 12. The following constitutional amendments were passed, to be submitted to the electors in November, 1903: (1) To change that provision of the constitution which prescribes that stockholders shall in all cases be liable over and above all the stock owned by them, substituting the following clause: "In no case shall any stockholder be individually liable otherwise than for the unpaid stock owned by him or her." (2) To change that clause of the existing constitution which provides that all moneys, stocks, real and personal property must be taxed by a uniform rule and according to their true value in money, so that the tax need be uniform only on all property of the same class. (3) To insert a provision in the constitution giving the governor the veto power usual in other States over bills passed by the assembly. It is provided that a bill may become law if it is passed by a two-thirds vote in each house over his veto; but "all votes for the re-passage of such bill shall in each house respectively be no less than those given on the original passage." The governor has also power to veto sections of bills and separate items in appropriation bills. (4) To amend the clause of the existing constitution providing for representation in the assembly in accordance with population, by providing that each county shall have at least one representative. In accordance with the act passed by the assembly on May 2, these proposed amendments, when they come before the electors, will all bear the mark of the approval or disapproval of the political party advocating or passing them; for by the law of May 2 it was provided that the action of any State convention of a political party for or against a proposed amendment might be certified and printed upon the regular ballot for the election at which the amendment was to be voted upon.

A State tuberculosis commission of seven members was created to report to the governor by May 3, 1903, on the desirability of establishing a State sanitarium for consumptive patients. A law for the suppression of anarchy provided that the penalty for attempting to kill the President, Vice-President or any cabinet officer, or the governor or lieutenant-governor of any State or Territory should be imprisonment for life, while that for the killing of any of these officers should be death.

A State board of embalming examiners was created to regulate the practice of embalming so as to prevent the spread of contagion and to provide for the better protection of health. A negotiable instruments law uniform with that of several other States was passed. The Ohio State Board of Uniform State Laws was also created, consisting of three persons, to collect data and report to the governor as to what laws of a general, commercial, charitable, and legal nature might be passed uniform with those of other States. An act providing that any municipal corporation might prohibit liquor traffic within its boundaries, was modified by stipulating that this could only be done after a local election held upon the demand of 40 per cent. of the qualified electors.

An act to protect creditors provided that the sale of merchandise in bulk or of an entire stock of merchandise should be void as against the merchant's creditors, unless the seller should have furnished to the buyer before the sale the names and addresses of his creditors and the amounts due them and a complete invoice showing the cost of the goods, and unless the purchaser also had before the sale given notification of his proposed purchase to the creditors.

Municipal Affairs.—The Supreme Court of Ohio rendered several important decisions concerning legislative control of municipal affairs. The constitution of Ohio expressly provides that municipalities shall be divided into but two classes. For many years, however, the legislature has entirely disregarded this provision, and has divided municipal corporations into numerous classes for purposes of special legislation under the guise of general enactments, which in reality could apply only to one or two cities. As a result, Cincinnati, usually a Democratic city, came under the government of city boards naturally Republican, while Cleveland, generally a Republican city, enjoyed home rule under what was known as the "Federal plan," whereby heads of departments were directly responsible to the mayor, and that official was directly responsible to the people. It was held that if Cleveland had home rule, Cincinnati was entitled to it also, as conditions in the two cities are practically identical. After the election of Tom L. Johnson as mayor of Cleveland, the local Republican politicians began agitations to deprive Cleveland of the charter granted in 1891, the legality of which had never been questioned. The act conferring the charter was applicable to "cities of the second grade of the first class," but Cleveland was the only city of that class. The politicians attacked the charter act on the grounds that it was special legislation. That the attack was political in character was evident from the fact that the charter was acknowledged to be

well drawn and in harmony with the best ideas on municipal administration. At the same time a clique of politicians succeeded in pushing a bill through the State legislature providing that the administration of the police force of Toledo should be transferred to a State board of police, its members, four in number, to be appointed by the governor. Immediately two Republicans and two Democrats were named by the governor, and the new police board formally demanded of Mayor Jones the transfer of the property of the police force. Mayor Jones refused to comply, saying: "If we once concede that there is some authority greater than the people that can, at will, remove or dismiss a public officer chosen by the people according to the terms of law, then it is clear that there is no hope for the survival of liberty or free government among men, and the provisions of the constitution guaranteeing a popular government are therefore valueless." The Toledo question and also that of the Cleveland charter were carried before the Supreme Court, which decided, on July 26, that the new Cleveland charter as well as all the other special charters granted by the legislature for the past 40 years were invalid. The State Police Board created for Toledo was later declared to be special legislation also. The court agreed not to enforce its decision until October or until the legislature could provide constitutional governments for the different municipalities of the State. A special session of the legislature was accordingly called by Governor Nash in August for this purpose, and a new municipal code enacted. The new code provides that the legislative function of every city shall be vested in a council consisting of but one chamber of not less than seven members, some of whom shall be elected by wards and some by the city at large. Executive responsibility is divided among boards of various origin, and the governor is given power to make appointments when the council refuses to ratify the choice of the mayor. By this provision the mayor's power is greatly curtailed, and it was alleged that the measure had been devised for the purpose of diminishing the influence of Mayor Johnson of Cleveland and of Mayor Jones of Toledo, who were strong advocates of municipal home rule and had large followings in their respective cities. The chief administrative authority of the city is vested in a board of public service, to consist of three or five members, elected by the people. A department of public safety, administered by two or four directors appointed by the mayor with the approval of two-thirds of the council, has full control of the police and fire departments. It is laid down in the code that appointive officers of the municipality shall be selected and protected by "the merit system." The value of this provision is lessened by a proviso that the members of the Board of Public Safety shall be appointed by the governor, if the council should after thirty days fail to ratify the choice of the mayor by a two-thirds vote. It is provided that no street railway franchises shall be granted without public notice, that the grant must be to the bidder agreeing to carry passengers at the lowest rates, and that the written consent of the property holders owning the majority of the property on the line of the proposed railroad must be secured. No franchise shall be granted for more than twenty-five years. Senator Hanna favored the granting of perpetual franchises, while Mayor Johnson urged the inclusion of a provision whereby franchises might be suspended whenever the voters might demand it. Many men of both parties supported the view that new franchises should not be granted by councils without referring the matter to the voters of the city. The worst feature of this complex and doubtful code is the subdivision and dispersion of responsibility, so that neither parties nor individuals can be called to account for maladministration.

Legal.—Petitions were filed, on February 28, in the Common Pleas Court of Cleveland, for indictment against the Cleveland Electric Railway Company and the Cleveland City Railway Company on the charge that these companies had used unlawful and corrupt means to prevent the new Three Cent Fare Railway Company from constructing and operating its road. The head of the new company filed a similar indictment, and a temporary restraining order was issued.

This law passed by the State legislature in 1896 extending all street railway franchises to 1946, or fifty years from the passage of the act, was declared unconstitutional by the Supreme Court in August. A suit was brought by a taxpayer to test the law, and the decision was given by the court on the grounds that the law arbitrarily and unreasonably classified street railway and municipal corporations, and that it was not of uniform and equal operation.

Conventions and Platforms.—The Republican State convention was held at Cleveland on May 28, with Senator Hanna in full control. The platform indorsed President Roosevelt; declared in favor of "proper and reasonable trade concessions" to Cuba in return for her concessions as to American products; approved the Chinese exclusion law; recognized the necessity of cooperation in business, but opposed all combinations that stifle competition, control prices, limit production, or unduly increase profit; upheld the policy in the Philippines; and favored the passage of laws against attempts on the life of the chief magistrate.

The Democratic State convention was held at Sandusky, September 3, with Mayor Tom L. Johnson of Cleveland as chairman. The platform reaffirmed the principles of the Kansas City platform; opposed imperialism and colonialism; declared against trusts and monopolies, and favored the nomination of United States senators by State conventions until the Federal constitution was so amended as to admit of their election by popular vote. The platform declared that all public service corporations should be required by law to make sworn public reports, and that the power of visitation and examination should be given to the proper auditing officers.

Elections.—At the regular annual election, held November 4, 1902, the only officer voted for was secretary of state, the vote being: Laylin (Rep.), 436,171; Bigelow (Dem.), 345,706, giving the Republican candidate a plurality of 90,465. The legislature of Ohio on January 14 elected Joseph B. Foraker (Rep.) United States senator, to succeed himself for the full term beginning March 4, 1903, and ending March 4, 1909. There was no contest in the Republican caucus over the senatorship, as Mr. Foraker had been indorsed by the Republican convention of 1901. The vote in the legislature was divided strictly along party lines. The legislature for 1903 will consist of 21 Republicans and 12 Democrats in the senate, and 68 Republicans and 42 Democrats in the house.

State Officers: For 1902 and 1903—Governor, George K. Nash, elected for two years, term ending January, 1904; lieutenant-governor, H. L. Gordon; secretary of state, Lewis C. Laylin; treasurer, Isaac B. Cameron; auditor, W. D. Guilbert; commissioner of common schools, Lewis D. Bonebrake; attorney-general, John M. Sheets; secretary of the State board of agriculture, W. W. Miller; commissioner of insurance, S. J. Vorys; secretary of the State board of health, C. O. Probst; commissioner of labor, M. D. Hatchford—all Republicans.

Supreme Court for 1903: Chief justice, J. F. Burkett; associate justices, John A. Shauck, William Z. Davis, W. B. Crew, J. L. Price, William T. Spear, Lawson E. Emerson—all Republicans.

For Congressional representatives, see UNITED STATES (paragraph Congressional Representatives).

OKLAHOMA, a southwestern Territory of the United States, has an area of 38,956 square miles. The capital is Guthrie. The Territory was organized May 2, 1890. The population in 1900 was 398,331; in June, 1902, as estimated by the government actuary, 461,000; and as shown by the county assessors' returns, 541,480, a gain of 143,149, or nearly 36 per cent. over 1901. The largest cities in 1900 were: Oklahoma City, with 10,037 inhabitants, and Guthrie, with 10,006 inhabitants.

Finance.—The amount of money received during the year ending November 30, 1902, was \$997,659.28; warrants redeemed during the year were \$745,006.71, and the balance November 30, 1902, was \$648,377.32. The expenses of the Territorial government proper were, for 1901, \$199,625; for 1902, \$154,276.09. The general revenue fund indebtedness on November 30, 1902, was \$462,440.23; the total amount of warrant indebtedness, including the above, was \$636,176.69. To this must be added the \$48,000 of school fund bonds, making a total Territorial indebtedness of \$684,176.60. If the balance in the treasury (\$648,377.32) be deducted the net debt remaining on November 30, 1902, would be \$35,799.37.

Agriculture and Industries.—The principal field crops of Oklahoma in 1902, as given by the *Crop Reporter*, were: Corn, 1,569,831 acres, 40,501,640 bushels, value \$15,795,640; winter wheat, 1,087,747 acres, 12,073,932 bushels, \$7,002,915; oats, 277,240 acres, 13,252,072 bushels, \$4,505,704; barley, 16,411 acres, 590,796 bushels, \$248,134; potatoes, 10,543 acres, 1,022,671 bushels, \$787,457; hay, 267,302 acres, 336,801 tons, \$1,786,045; flaxseed, 19,800 acres, 152,460 bushels, \$144,837.

Railroads.—The length of railroad track, as returned for taxation in March, 1902, was: Main track, 1,413.23 miles; side track, 181.67 miles, making a total of 1,594.80. More railroad was built in Oklahoma during the calendar year 1902 than in any other State or Territory of the United States. The amount constructed was 568 miles, raising the total mileage at the end of the year to more than 2000 miles.

Land Conditions.—During 1902, 3,068,502 acres of land were filed on and there were still vacant 3,777,883 acres, of which over 3,000,000 acres were in Beaver County. The system employed in leasing the Territorial lands in the latter, Wichita, Caddo, Kiowa, and Apache reservations proved eminently successful. All of these lands were leased, the amount of rentals received during the year ending June 30, 1902, being more than double the amount of the previous year. All of the 2,055,000 acres of school lands were leased and the income for 1902 was \$300,000. The present laws which regulate the distribution of the school fund do not allow the school districts in the new counties to participate in the distribution. It was estimated that \$22,000 would have gone to these counties at the last distribution in July.

Territorial Officers.—For 1903: Governor, James B. Ferguson; secretary, William Grimes; treasurer, Cassius Rambo; auditor, L. W. Baxter—all Republicans.

Supreme Court for 1902 and 1903: Chief justice, John H. Burford; associate justices, Bayard T. Hainer, Benjamin F. Burwell, Clinton F. Irwin, Frank E. Gillette, James K. Beauchamp, and J. L. Pancoast—all Republicans.

OLD-AGE PENSIONS. See PENSIONS FOR WORKINGMEN and BELGIUM.

OLEOMARGARINE. See UNITED STATES (paragraph Oleomargarine Bill).

OLPHERTS, Sir WILLIAM, English general, died in Norwood, England, April 30, 1902. He was born in 1822, was educated at the Addiscombe Military Academy, and began his military career in the Bengal Artillery in 1839. Serving first in the Burma war of 1841, he was engaged in many battles and campaigns in India, Turkey, and the Crimea, in all of which he displayed a reckless courage that gained for him the nickname of "Hell-Fire Jack." He attained especial distinction in 1857 during the Indian mutiny, participated in Lord Hyde's capture of Lucknow, and for his gallantry throughout was rewarded with the Victoria Cross. He held several important military posts in India, and in 1878 was made colonel-commandant of the Royal Artillery.

OMAN, a sultanate of Arabia (*q.v.*).

ONTARIO, a province of the Dominion of Canada, with an area of 222,000 square miles, and a population, according to the census of 1901, of 2,182,947, as compared with 2,114,321 in 1891. Capital, Toronto; population, 207,971, as compared with 181,200 in 1891. At the end of 1900 there were 5655 public schools, with 420,097 registered pupils; 355 Roman Catholic separate schools, with 42,397 pupils; 131 high schools, with 21,723 pupils; 120 kindergartens, with 11,234 pupils; and 76 teachers' institutes. Of higher educational institutions the province has 6 universities and 6 colleges, with a total of 4104 students.

Government and Finance.—The province is administered by a lieutenant-governor appointed by the governor-general in council and aided by a responsible ministry. There is one legislative assembly of 98 members elected by manhood suffrage. Ontario has 24 seats in the Dominion Senate and 85 in the House of Commons. The revenue and expenditure for the calendar year 1901 were \$4,466,043 and \$4,038,834 respectively. The largest items of revenue were the Dominion subsidy, \$1,196,872; crown lands, \$1,618,309; and licenses, \$376,372. The chief items of expenditure were the maintenance of public institutions, \$833,163; education, \$782,193; administration of justice, \$416,042; and civil government, \$281,135.

Industries and Commerce.—According to the final official estimate of 1902 there were 8,677,988 acres under crops, and the returns were as follows for the chief crops: Fall wheat, 20,033,669 bushels; spring wheat, 6,048,024 bushels; barley, 21,820,602 bushels; oats, 106,431,439. The area of cleared land devoted to pasture in 1902 was 2,879,967 acres, an increase over the previous year, and the area devoted to orchards and gardens was 356,251 acres, an increase over 1901. The total mineral production, which is rapidly growing in importance, was valued at \$11,831,086 in 1901, as compared with \$9,298,624 for 1900. The officially estimated value of the product of the fisheries for 1901 was \$1,428,078. The trade of the province for the fiscal year ending June 30, 1902, was largely in excess of that of the preceding year, aggregating \$134,830,040 as against \$109,980,407 for 1901. The exports were \$48,597,480, as compared with \$36,490,028, and the imports, \$86,232,560, as against \$73,490,379 for 1901. The mineral production, comparatively unimportant until recently, promises much in the development of the iron and steel industries at Sault Ste. Marie. During 1901 47 companies were incorporated for mining purposes with a nominal capital of \$27,716,000, and 13 foreign companies, with \$12,250 capital, were licensed. The output of metal minerals for 1901 was valued at \$5,016,734, as compared with \$2,565,286 in 1900.

History.—The three most important facts in connection with Ontario's politics and development during 1902 are the building of a new railway, the progress of settlement and opening up of new industries in sparsely inhabited districts, and the experiments in prohibitory liquor legislation. The general provincial elections were held on May 29, and the Liberal administration, of which the Hon. G. W. Ross, is the head, was sustained by the narrow majority of 2, the Liberal members returned being 50 and the Conservatives 48. This result left it in doubt for some time whether the Ross government would remain in power, and the result of several contested election returns was awaited. Charges of corruption were brought against the government, and the defection of a well-known Liberal, Hon. S. H. Blake, from his former political affiliations was believed by many to have brightened the prospects of the opposition. To offset charges of corruption against the government the statement was made that Mr. Blake and his friends were interested in obtaining control of rich mineral lands, for a company in connection with the Steel Trust, and public opinion became excited when this statement was widely circulated by the press. The result was that when the by-elections were held in December, the Ross government obtained sufficient additional support to make a substantial majority. In the speech

from the throne at the opening of Parliament in January, prohibitory liquor legislation was promised. The government had been pledged to the prohibitionists, and the decision of the Imperial Privy Council that the Manitoba prohibition law is constitutional, encouraged the hope that Ontario could have an equally drastic measure. When the act was introduced in the legislative assembly on February 19, it was found that, although its provisions were similar to those of the Manitoba Act, its final success depended upon a referendum. The condition was that if at this referendum a vote amounting to a majority of the votes cast at the general election in May should be recorded, the act, which had passed the assembly, would be enforced. Prohibitionists were intensely hostile, believing this to be a shelving of their favorite measure, which it proved to be. At the taking of the referendum in December, the vote cast was not sufficient, though it amounted to 160,000, about 30 per cent. of the votes of the whole electorate. The work of railway building and settlement in what is called New Ontario, made considerable progress in 1902. In January legislation was promised to authorize the construction of the first government railway in Ontario running through the district between Lake Nipissing and Lake Abitibi, and northwesterly from Lake Temiscaming. This district contains much arable land, timber, and mineral deposits. The road is now under construction. A plan for settling 2,000,000 acres in this region has been agreed upon between the government and an American syndicate, which has contracted to place 12,000 settlers there in a specified time and to resell the land to the settlers at a reasonable advance upon the price of purchase.

ORANGE RIVER COLONY, formerly the Orange Free State, lying south of the Transvaal and northeast of Cape Colony, has been since May 28, 1900, a colonial possession of Great Britain. Its area is estimated at 48,326 square miles, and its population at the outbreak of the war in South Africa was 207,503, comprising 77,706 whites, of whom 85 per cent. were Boers, and 129,787 Kaffirs. The capital and largest town is Bloemfontein, with 6500 inhabitants. The predominant religion is that of the Dutch Reformed Church. Education under the republic was neither free nor compulsory. During the war the British maintained instruction in the towns and refugee camps, and since the establishment of peace steps have been taken for the organization of a general school system for the colony. The country is not well adapted for agriculture, only about 1 per cent. of the area having been under cultivation in 1899. The extensive grazing lands, however, afford excellent opportunities for stock and sheep raising, which have been the chief industries of the country. There are valuable coal deposits in the north, and important diamond mines, the output from which in 1898 was valued at over £1,500,000. The government of the colony since the British occupation has been largely under military control, but there has been with the military a coordinate civil administration, and as far as possible civil magistrates have been appointed to supersede the military commissioners. The executive control has been vested in a governor (Lord Milner), who is also governor of the Transvaal, and who exercises his authority through a lieutenant-governor (Sir Hamilton Goold-Adams). The imports in the year 1901-02 were valued at £1,070,000 and the exports at only £16,979. The British administrators' estimates for revenue and expenditure, made early in 1902, were respectively £756,200 and £691,140, the latter amount including the sum of £300,000 for the maintenance of the South African constabulary. There are two main lines of railway in operation, one running from Norval's Pont, on the Orange River, through Bloemfontein to Johannesburg and Pretoria in the Transvaal; the other starting at Harrismith connects with the Natal system. During 1902 surveys were made for three new lines; (1) an extension of the Harrismith line via Reitz to Vereeniging; (2) a branch from Thaba Nehu on the Bloemfontein line through Modderport to Ficksburg; (3) an extension of the existing Springfontein-Fauresmith line from Fauresmith to Koffyfontein. Construction work on the first two extensions was being rapidly pushed at the end of the year. Martial law was repealed on November 19, 1902, and on November 28 it was reported that only 8000 remained in the burgher camps, over 33,000 having been sent back to their homes. For the Anglo-Boer war, see **TRANSVAAL**.

OREGON, a Pacific Coast State of the United States, has an area of 96,030 square miles. The capital is Salem. Oregon was organized as a Territory August 14, 1848, and was admitted as a State February 14, 1859. The population in 1900 was 413,536, and in June, 1902, as estimated by the government actuary, 434,000. In 1900 the largest city was Portland, with a population of 90,426.

Finance.—The balance in the State treasury of Oregon at the beginning of the nine months ending September 30, 1902, was \$944,623.40. The treasury receipts during the period were \$3,408,795.86, and the disbursements \$3,215,843.62, leaving on hand on September 30, 1902, \$1,137,575.64.

Agriculture and Industries.—The principal farm crops of Oregon for 1902, according to the *Crop Reporter*, were: Winter wheat, 398,845 acres, 8,774,590 bushels,

value \$5,878,975; spring wheat, 378,532 acres, 6,737,870 bushels, \$4,514,373; oats, 281,955 acres, 8,092,108 bushels, \$3,317,764; barley, 62,324 acres, 1,988,136 bushels, \$1,033,831; potatoes, 35,724 acres, 3,679,572 bushels, \$2,023,765; hay, 343,537 acres, 700,815 tons, \$5,242,096. There was an enormous increase in the lumber industry in 1902. According to the *Pacific Lumber Industry* the entire product for the year amounted to 236,902,143 feet, against 169,715,624 feet in 1901, nearly 40 per cent. increase. Of 51,973,220 feet exported in 1902, 24,254,347 feet went to China. The gold mines showed an increased and the silver mines a decreased product for 1902. The director of the mint reported \$1,860,465 of gold and \$63,600 in silver for 1902. Trade journals assert that the gold output was nearly twice that figure. The figures for 1900 were respectively \$1,640,000 and \$91,995.

Conventions and Platforms.—The Republican State convention was held at Portland on April 2. The platform favored the retention of the Philippines; trusts and combinations were strongly condemned; the principles of protection were upheld "in necessary cases of industries still in their infancy or unable to compete with foreign production." The exclusion of the Chinese was approved and the right of labor to organize was asserted. Concerning State matters, the convention advocated reasonable salaries for State officers; the opening of the Dalles to navigation; government aid and control of irrigation; the leasing of public lands; federal conservation of fisheries; the Grouse oleomargarine bill; the extension of the primary law throughout the State, and the passage of the amendment to the constitution providing for the initiative and referendum.

The Democratic State convention was held at Portland on April 10. The platform advocated a tariff for revenue only; Chinese exclusion; the speedy construction of the Nicaragua Canal; federal improvement of the Columbia River; irrigation of arid lands by the federal government; the giving of pensions to Indian war veterans, and the eight-hour day in public work. The convention condemned trusts, "government by injunction," and combinations of railroad interests. Concerning State matters, the platform declared in favor of non-partisan home rule in municipal government; fair payment for public franchises; extension of the principle of public ownership; the payment of fixed salaries to State officials; the enactment of laws to prevent railroad discrimination, and the right of labor combinations. The creation of a national department of labor was urged in connection with the general labor question.

The platform of the Socialist party demanded that all industries should be owned by the people; the limitation of official salaries to \$2000 a year, and the exclusion of the Chinese until such time as socialism shall prevail.

Other Events.—Harry Tracy, a convict, escaped from the penitentiary at Salem on June 9 with a fellow prisoner. Nearly \$6000 in rewards was offered for his capture, and about one thousand men went in pursuit. Though six times surrounded he fought or stole his way out, killing a number of his pursuers, and after a flight of 1500 miles, took refuge in a swamp in Lincoln County, Wash. Here, surrounded and wounded, on August 6 he shot himself. In several parts of the State during June there were encounters between cattlemen and sheep-herders, the former attempting to keep possession of the grazing lands. A number of herders were killed, and thousands of sheep were wantonly shot. Extensive forest fires on Clockamas River and Clear and Eagle creeks, September 14, did an enormous amount of damage. On Eagle Creek 24 villages were destroyed.

Elections.—At the regular biennial State elections, held June 2, 1902, a full State ticket was elected, all the Republican candidates being chosen with the exception of Furnish for governor, who was defeated by Chamberlain (Dem.) by a vote of 41,581 to 41,857. The contest was one of the most exciting ever held in the State, and factional feeling ran high. The chief issue, as set forth in the party platform was the question of imperialism, but the defeat of Furnish was the result of personal and factional feeling rather than any sentiment hostile to the administration's policy in the Philippines. The other Republican candidates were elected by pluralities of about 10,000. The State legislature for 1903 will consist of 21 Republicans, 3 Democrats, 3 Citizens' party, 1 Union, 1 Fusionist, and 1 People's Democrat in the Senate, and 48 Republicans, 11 Democrats, and 1 Citizens' party in the House. The voters decided in favor of an amendment to the constitution providing for the adoption of the initiative and referendum. The terms of the initiative are that, on petition of 8 per cent. of the voters, any proposed law or amendment to the constitution, must be submitted to the people for adoption or rejection, and on petition of 5 per cent. of the voters any bill enacted by the legislature must be submitted to the people for acceptance or rejection.

State Officers.—For 1902: Governor, T. T. Geer; secretary of state, Frank I. Dunbar; treasurer, C. S. Moore; superintendent of instruction, J. H. Ackerman; attorney-general, D. R. N. Blackburn—all Republicans. For 1903: Governor, G. E. Chamberlain (elected for four years, term ending January, 1907); secretary of state,

F. I. Dunbar; treasurer, C. S. Moore; superintendent of public instruction, J. H. Ackerman; attorney-general, A. M. Crawford—all Republicans except Chamberlain, Democrat.

Supreme Court for 1903: Chief justice, Frank A. Moore; associate justices, Charles F. Wolverton, and Robert S. Bean—all Republicans.

For Congressional representatives, see UNITED STATES (paragraph Congressional Representatives).

ORGANOTHERAPY is the use of animal glands, or extracts made from them, as medicines. According to Dr. Davies, an English physician, whose address on this subject before the Hunterian Society in February, 1902, is abstracted in the *Philadelphia Medical Journal*, for May 10, 1902, the use of animal substances in medicine dates back to 1500 B.C. William Salmon's work, published in 1677, gives an enormous number of preparations of extracts from the human body and animals. Modern organotherapy dates from the lectures of Brown-Séquard in 1869. He pointed out that all glands, with or without excretory ducts, elaborate an internal secretion, which is of great importance in the animal economy. Recent experiments have confirmed this view. The effect of the testicular extract is proved negatively by the results of castration. When testicular extract is injected subcutaneously it produces an increase of hemoglobin, the cardiac force is strengthened, the vascular tone is exalted, and the mind becomes more active. It has been used in insanity with indeterminate results. Ovarian extract has a similar, but less powerful effect. It has been found useful in amenorrhoea, with chlorosis, in the menopause, in the symptoms following oophorectomy, and in allied conditions. Overdoses may cause death. The thyroid gland is probably the most useful of all these preparations. In cretinism and myxœdema it is of undoubted value, and in goitre not of the exophthalmic type. Certain skin affections have been benefited by thyroid extract such as lupus, psoriasis, ichthyosis, and alopecia. Suprarenal extract has been used in Addison's disease with a certain proportion of cures. In other conditions, however, brilliant results with this drug have been achieved. It is a valuable vaso-constrictor and cardiac tonic and it has a certain value in heart diseases. When applied locally it is a powerful astringent and relieves the pain of cancer of the breast or of the œsophagus, and in tuberculous laryngitis. Its most important use is in checking hemorrhage. This it does whether used locally or given internally. Thymus gland has been employed in cases of exophthalmic goitre with no result except improved general condition. Extract of the pituitary body also has been used in this disease with negative results. Hepatic extract was given in diabetes mellitus due to functional debility of the liver and in alcoholic cirrhosis with good effect. Pancreatic extract has been given for diabetes mellitus. Extract of the intestine has been employed with considerable success to combat stercoræmic poisoning occurring in cases of strangulated hernia and invagination of the bowel. Renal extract has been used in cases of uremia and nephritis with temporary benefit. Favorable results are claimed for splenic extract in exophthalmic goitre and typhoid fever, and pulmonary extract acts well in pleuropulmonary suppuration. Nerve extracts are recommended in locomotor ataxia, epilepsy, chorea, and neurasthenia. Shober has found mammary gland extract of value in uterine fibroids. It controls the hemorrhage, inhibits the growth of the tumor up to a certain point, and renders the patient more amenable to operation. Parotid gland extract has been found useful in controlling pain in uncomplicated ovaritis.

ORNITHOLOGY. As in 1901, bird protection has been a leading topic in the ornithological world during 1902, and it is now regarded as the natural object of ornithological organizations. The most notable single event during the past year in the way of caring for birds was the signing at Paris, March 19, of an international agreement for the protection of birds useful to agriculture. The contracting parties were Austria-Hungary, Belgium, France, Greece, Lichtenstein, Luxemburg, Monaco, Portugal, Spain, Sweden, and Switzerland. A number of species are listed to receive unconditional protection, the destruction of the nests or eggs, as well as of the birds themselves being prohibited. It is greatly to be regretted that Italy was not one of the signers, as probably more song-birds are destroyed there for food than in any other European country, and she forms a large part of one of the principal migration lines. The committee on bird protection of the American Ornithologists' Union had a very successful year, and at its close published a voluminous report on the work done and the present needs of the birds in the way of friendly legislation. The committee has had at its disposal rather more than 2200 dollars contributed by private subscription, and this has been spent for warden's salaries and for necessary expenses connected with securing favorable legislation. Maine, Virginia, and Florida, have been the scenes of the most work, the expenditure in those three States amounting to nearly one-half the entire sum, but more or less money has been spent in eighteen States. The report is most emphatically a report of progress, and the prospects for the preservation of our native birds are better than

ever before. But if bird protection is steadily gaining ground, the scientific study and collecting of birds is not lessening its sway, as a glance at the literature mentioned below will promptly show. Two collecting trips demand a word; one was that of the well-known ornithologist, Dr. Hans Gadow, who has been in Central America and returned to England in the early fall; the other was that of Capt. Boyd Alexander, who left England late in the summer to study and collect the birds of Fernando Po and other places in the Bight of Benin, and to explore the country around Lake Tchad, especially to determine so far as possible the relationship between the East and West African faunas. In this connection, it may be mentioned that the Carnegie Museum at Pittsburg has purchased the collection of the birds of Holland, belonging to the Baron Snouckaert van Schauburg and mounted by Tar Meer, the celebrated Dutch taxidermist. It is an unusually well selected collection of some 800 specimens, representing 300 species.

Organizations.—The year has been a good one for organizations, so far as any reports have been made. The different ornithological societies of Europe have apparently enjoyed a satisfactory season, while the Australasian Union has had a most successful initial year. In America the Audubon societies and the various local and State clubs seem to have prospered and many of them have held successful meetings. The third annual conference of Audubon societies was held in Washington, November 19 and 20, in connection with the gathering of the American Ornithologists' Union. Delegates were present from sixteen State societies. The principal business transacted was the appointment of a committee to examine the sample stock of wholesale millinery dealers, with a view to a systematic and intelligent cooperation between the wholesale millinery trade and the Audubon societies. The educational side of bird protection work was emphasized and arrangements were made for the exchange of lantern slides for use in lectures on bird protection. A public appeal for suitable negatives for such slides was issued. The twentieth congress of the American Ornithologists' Union convened in Washington, Monday evening, November 17, and was in session until Friday, November 21. The secretary reported the membership as 753, and 90 new members were accepted, nearly all of whom were in the class of associates. Of the 22 papers on the programme, 6 dealt with the habits of birds, 4 with the plumage, and 4 with questions of history and nomenclature. The subject of bird protection occupied a large part of the discussions and the report of the committee on that subject was received with much interest. A committee on International Bird Protection was chosen, and two delegates were elected to the forthcoming congress. The next meeting of the union, in 1903, will be in Philadelphia.

Literature.—The ornithological literature for 1902 has been unusual in volume if not in value. The journals devoted to the science are apparently prosperous and have contained numerous articles of interest and importance. Perhaps the most interest centres in the *Emu*, the organ of the Australasian Ornithologists' Union, which has just completed its first year. The illustrations are one of its best features, but the various articles have been of great importance and very readable, especially those dealing with the natural history of Australian and Tasmanian birds. The *Auk*, the American organ, and the *Ibis*, the British organ, have both been extremely interesting and are ably edited and well illustrated, and *Bird Lore*, the organ of the Audubon societies, has fully maintained its own high standard. Turning now to the papers, pamphlets, and books which have been issued, we find such a wealth of material that it is hard to select those most worthy of mention. Among those dealing with birds of a definite area, the most important work is undoubtedly the second volume of Ridgway's *Birds of North and Middle America*, the first part of which was issued in 1901. This second part includes only four families, the tanagers, troupials, honey-creepers, and wood-warblers, but the book contains over 850 pages and has 22 plates, illustrating details of the external morphology. There are 112 tanagers, 111 troupials (including what are known in the United States as black-birds, orioles, meadow-larks, and bobolinks), 29 honey-creepers, and 181 warblers, a total of 433 species and subspecies, but it is only fair to state that a very large proportion of these are what to the non-specialist are, to say the least, questionable species. Though not so important to ornithologists, Mrs. Bailey's *Handbook of Birds of the Western United States* is of more general interest to the public, at least to those who live west of the Mississippi Valley. It is a volume of over 600 pages, with 33 full-page plates, and over 600 cuts, planned along the same lines as Chapman's well-known handbook of the birds of the eastern United States. It will undoubtedly prove one of the most useful of American books on birds. A somewhat similar work, though much simpler in form and style is Henshaw's *Birds of the Hawaiian Islands*, a volume of 146 pages, with notes concerning and descriptions of 125 birds, of which no less than 60 are endemic woodland passerines, peculiar to the islands. It is sad to learn that one-sixth of these are approaching extinction. A very valuable paper on the ornithology of an out-of-the-way place is Brewster's *Birds of the Cape Region of Lower California*, a volume of 241 pages, treating of 255

kinds of birds, though 88 are subspecies. The region included is an isolated mountainous section about 120 miles north and south by 85 east and west. Another valuable paper of the same kind is Berlepsch's and Hartert's *On the Birds of the Orinoco Region*, a volume of 134 pages, based on a collection of several thousand specimens, representing 468 species and subspecies. There are many valuable notes on questions of nomenclature and distribution. Of systematic works, Dubois's *Synopsis Aënum* is now completed through the first volume, and it consists of about 740 pages, with 12 plates. It treats of 9417 species and 2477 additional subspecies, and covers most of the land birds. Any working ornithologist will welcome Richmond's *List of Generic Names Proposed for Birds During the Years 1890 to 1900 Inclusive*, a report of 66 pages, including 475 names. As a striking example of the abuse of the trinomial system of nomenclature, Oberholser's *Review of the Larks of the Genus Otocoris* affords the opportunity for an attack on that system. Of the common American horned lark no less than 23 subspecies are recognized and named. Of strictly morphological papers, Shufeldt's contributions to our knowledge of the osteology of birds have continued to appear, and are of the greatest value, while Strong's publications regarding the development, structure, and color of feathers are of unusual importance. Before passing on to popular books, mention should be made of the second volume of Oates's *Catalogue of the Collection of Birds' Eggs in the British Museum*. This is a book of over 200 pages, illustrated with 14 beautifully colored plates. Among the numerous books intended to interest the general public, first place may perhaps be assigned to Job's *Among the Waterfowl*, a volume of nearly 250 pages, with numerous illustrations from photographs by the author. In an entertaining manner, and fortunately with due accuracy, Mr. Job tells of the natural history of auks, murre, grebes, gulls, ducks, and other aquatic birds, with especially good accounts of the breeding habits, based on the author's observations in Dakota, the Magdalen Islands, Bird Rock, and on islands off the New England coast. Another American book of great merit is Sandys's and Van Dyke's *Up-land Game Birds*, a volume of 438 pages treating of the birds most sought by sportsmen. Most of the book is by Mr. Sandys, who is gifted with a real love for his subject and a charming style. A much more expensive volume of a similar sort is *The Natural History of the British Surface-Feeding Ducks*, a magnificent quarto by the artist Millais, who here shows himself as well an author and observer of the first class. Although only ten species are included in the book, it is a quarto volume, weighing nearly nine pounds, and has numerous illustrations, including 41 colored plates of exceptional merit. Still another volume of special interest to sportsmen is Witherby's *Bird Hunting on the White Nile*, a small book of 117 pages, very interestingly written, and full of valuable information regarding the human, as well as the avian, inhabitants of the regions traversed. Finally, we may mention Keyser's *Birds of the Rockies*, a beautifully prepared volume of nearly 400 pages with a fair number of illustrations, including four colored plates. The book is especially intended for the bird-loving amateur, and is a valuable addition to that class of literature.

OSBORNE, WILLIAM MCKINLEY, United States consul-general at London, England, died there April 29, 1902. He was born April 26, 1842, in Girard, O., studied at Poland Seminary in Ohio, entered Alleghany College, and when the Civil War broke out joined the Twenty-third Ohio Regiment. In 1862, his military career being ended by an attack of typhoid fever, he studied law, was admitted to the bar in 1864, and began practising in Youngstown, O., where he was elected mayor in 1874. In 1880 he removed to Boston; in 1883 was elected to the Boston board of police, but was removed in 1893 on account of allegations made by Mayor Matthews. In 1896 he was secretary of the national Republican committee, and in 1897 was appointed consul-general in London. He was a cousin of President McKinley.

OSMUN, THOMAS EMBLEY, an American orthoëpist, elocutionist, and critic, better known by his pseudonym of "Alfred Ayres," died in New York City, October 26, 1902. He was born in Montrose, Summit County, O., February 26, 1834, and was educated first at Cleveland, O., and then at Oberlin College. After six years of advanced study in Berlin and Paris, he returned to the United States, and began to contribute extensively to periodicals, especially to the *Dramatic Mirror*, *Werner's Magazine*, and the *New York Clipper*. His writings, which are, in the main, expositions of his theories of elocution, attained considerable circulation and provoked much journalistic criticism. They had much to do, however, with the correction of many prevalent mispronunciations and of errors in the use of words, though the constant critical attitude of their author made him personally unpopular. He was an editor of the *Standard Dictionary*, and wrote *The Orthoëpist* (1880); *The Verbalist* (1881); *Acting and Actors* (1894); *The Mentor* (1897); *The Essentials of Elocution* (1897); *Some Ill-Used Words* (1901).

OSTEOPATHY. The osteopaths have made determined efforts during 1902 to obtain official recognition in several States with varying success. The Brackett bill to regulate and legalize the practice of osteopathy in New York State provoked much discussion. Several United States senators were said to have "faith" in osteopathy, but the medical societies throughout the State organized a determined opposition, and the bill was defeated in January. In Massachusetts the bill authorizing the Boston Institute of Osteopathy to grant the degree of doctor of osteopathy has been defeated in the house of representatives, being opposed by the State board of education, the board of medical registration, and by the heads of other educational institutions in that State. In Iowa the legislature has passed a bill in recognition of the osteopaths, and authorized the State board of medical examiners to issue certificates to graduates of osteopathic colleges and to others who pass examination, and has authorized the choice by the governor of an osteopath to become a member of the State board of health and State board of medical examiners.

OTEY, PETER JOHNSTON, American financier and politician, died in Lynchburg, Va., May 4, 1902. He was born in Lynchburg, December 22, 1840, and graduated at the Virginia Military Institute in 1860. He then took up railroad engineering work, and at the outbreak of the Civil War joined the Confederate army, participating in the western campaign that ended with the capture of Fort Donelson and the battle of Shiloh. From then until the end of the war he was with the Army of Northern Virginia, and was in command of a brigade under General Early. He became interested in railroad and banking affairs in 1869, and prominent in Virginia politics. In 1894 he was elected member of Congress from the sixth Virginia district.

OTHOPLASY. See BIOLOGY.

PACIFIC CABLES. The year 1902 was a notable one in the history of submarine cable laying, witnessing the completion of the All-British cable from Australia to Canada, and the beginning of the All-American cable which is to connect the United States and the Philippines. The All-British cable, the laying of which was begun in 1901, was completed on October 31, 1902, and opened for public messages on December 8. Its total length is about 7800 miles, and its total cost, including the expense of surveying and installation will amount to £1,999,000 (\$9,728,133). It was constructed and laid by the Telegraph Construction and Maintenance Company, a London corporation. The expense was borne by the British government, and the governments of Canada and some of the States of the Australian commonwealth, and New Zealand in the following proportion: Great Britain, five-eighteenths; Canada, five-eighteenths; and New South Wales, Victoria, Queensland, and New Zealand, one-ninth each. The line runs from Vancouver, British Columbia, via Fanning (or Palmyra) Island and Fiji, to Norfolk Island, where it branches to Queensland and New Zealand respectively. On November 13 it was announced that the rate per word for cable messages between England and Australia had been set at 3s., the tariff by previous routes having been 9s. 4d. a word.

On August 10, 1902, the conditions were made public, upon the acceptance of which the President would give his assent to the proposition of the Pacific Commercial Cable Company organized by John W. Mackay and associates in September, 1901, for the laying of an All-American cable via Hawaii to the Philippines and thence to some point on the coast of China. These conditions, based partly on the Post Roads act of 1866, were in effect: that the company should enter no arrangement debarring other American companies from landing cables in China or connecting with island or coast lines there; that the company's line should touch at no other than American points between San Francisco and China, and that the line from the Philippines to China should be wholly independent of all foreign lines, thus rendering the United States independent of the existing English line from Manila to Hong Kong; that the rates charged should not exceed one dollar a word from San Francisco to Manila or China, nor more than 35 cents from San Francisco to Honolulu from the time that that line had been in operation two years, and till then not more than 50 cents; that after the completion of the line all operators and employees of the company above the grade of laborer should be American citizens; that government messages should have a priority over all others, the rate for these to be fixed annually by the postmaster-general; that at any time the United States should have a right to buy the cable at a fair appraised value; that in the event of war the United States should take full control of the cable in its discretion, sever branch lines at will and declare void any contracts entered into with foreign governments by the cable company. Upon the acceptance of these conditions, which may be revoked or modified by the President at any time, the United States agreed to turn over to the Pacific Commercial Cable Company the right to use the exhaustive soundings in the Pacific, made by the United States navy at a cost of over \$200,000. In October, although it had not signified its acceptance of the government's terms,

the company proceeded to contract for a cable. After a conference between agents of the company and Attorney-General Knox on November 24 the company finally announced its acceptance of the conditions; on December 16 the American end of the cable was landed at San Francisco, and the steamship *Silverton* started for Honolulu with the cable on board. On December 26 the cable was landed near Honolulu, in the Hawaiian Islands, and the first message transmitted. From Honolulu the cable will be laid via Midway Island and Guam to Manila, it being expected that the complete line to the China coast will be in operation by the summer of 1903.

PAINTING. The year 1902, especially in the United States and Great Britain, was singularly devoid of interest, at least in the production or exhibition of notable works. The record for the year is little more, for the most part, than a catalogue of local exhibitions and a necrology. In the United States the original scheme for the painted decoration of the Louisiana Purchase Exposition buildings at St. Louis placed the matter in charge of a committee of ten leading painters who were to do a great part of the work themselves. This plan created so much opposition that a single commissioner has been substituted, and Mr. F. D. Millet appointed to that position. The usual exhibitions of the National Academy, the Social of American Artists and the Water-Color Society were held in the Fine Arts Building in Fifty-seventh Street, New York City. The Clark prize of the National Academy was won by Mr. Charles Schreyvogel, a painter of Western life in the style of Remington. Albert Bierstadt, an American landscape painter of the old school, died March 6.

In England the Royal Academy winter exhibition of old masters made a specialty of Claude Lorrain, showing a fine series of his paintings and drawings. At the regular exhibition of the Royal Academy there were several important portraits by the American painter, Sargent, and many good landscapes. The exhibition at the New Gallery was devoted to portraits and relics of the monarchs of Great Britain. There was an important exhibition of landscapes at the Dudley Gallery in London. The English artist, Sidney Cooper, died February 7, 1902.

The two Salons, as the exhibitions of the Société des Artistes Français and the Société Nationale des Beaux Arts are called, were both held in the larger of the two art palaces built for the Exposition of 1900 in Paris. In the first, especially interesting works were: "The Glorification" of Colbert, a design for Gobelines tapestry, by J. P. Laurens, and large decorations for the Hôtel de Ville by Détaille, representing scenes from the French Revolution. In the second, especially noticeable were the "Île heureuse," by Besnard, and the "Jour de paix et de joie," by Victor Prouvé. In the Prix de Rome competition the first prize in painting was won by Mr. Sieffert, a pupil of Gérôme; the second by M. Guétin, a pupil of Lefebvre, Benjamin Constant, and Tony Robert-Fleury. The subject was the "Raising of Jairus's Daughter."

The Thomy-Thiery collection, which is rich in French paintings, especially of the Fontainebleau school, and in Barye bronzes, has been presented to the Louvre. Tadamas Hayashi, commissary general for Japan at the Exposition of 1900, who published a large folio on that section, has sold his collection of Japanese pictures and art objects in Paris. The atelier of the painter Gustave Moreau, with an extraordinary collection of his paintings and drawings, has been presented to the minister of public instruction as a museum. The arrangement of this collection has excited much comment. The painter Benjamin Constant died May 26, 1902. There was an important sale of his works by Christie, Manson, and Wood in London on July 14. The religious painter, James Tissot, whose remarkable paintings of the Life of Christ were acquired by the Brooklyn Institute, died August 3, 1902. Louis Deschamps died August 8. M. Eugene Müntz, the learned historian of the Italian Renaissance and librarian of the Ecole des Beaux-Arts, died October 30. J. G. Vibert died in July.

An extremely interesting exhibition of early Flemish painting was held at the provincial palace in Bruges, Belgium, in May.

In Germany the movement called the Secession, which includes the large body of younger and more independent artists, becomes stronger each year, and holds exhibitions in all the larger cities. The most important of these is in Vienna, which in 1902 contained a fine series of works by Boecklin, Franz Stuck, Max Klinger, and Rudolf Alt, who recently completed his ninetieth year. At the Berlin Secession, notable pictures were: Max Liebermann's "Delila," Max Slevogt's "d'Andrade as Don Juan," and "A Spanish Company," by Zuloaga, who works in the manner of Goya. The great summer exhibition in the glass palace in Munich occurred as usual. All the larger German cities hold regular annual art exhibitions. A notable collection of the works of Boecklin was shown in Dresden.

The most important incident of the year in Italy has been the purchase by the Italian government of the superb Borghese collection of paintings. The price was 3,600,000 lire in annuities. The chief picture in this collection is the "Sacred and

Profane Love" by Titian. A considerable quantity of decoration has been discovered in the Sala delle Asse of the Castello in Milan, which is undoubtedly the work of Leonardo da Vinci done in the time of Lodovico il Moro. A picture has been found in the church of the village of Affori, near Milan, which is either the original or an early replica of the Madonna of the Grotto by Leonardo da Vinci.

PALMER, ALICE FREEMAN, former president of Wellesley College, died in Paris, France, December 6, 1902. She was born in Colesville, N. Y., February 21, 1855, and in 1876 graduated at the University of Michigan. After teaching for a while in Michigan and Wisconsin schools she was appointed in 1879 to the chair of history in Wellesley College, and in 1882 she succeeded Miss A. L. Howard as second president. During the five years that she acted as the head of Wellesley she established important relations with secondary schools, coordinated the courses of study and raised the standard of scholarship, and was very successful in securing the endowments and financial patronage of which the young institution was in great need. She resigned in 1887 to become the wife of George Herbert Palmer, professor of philosophy at Harvard, but continued to serve on the board of trustees; and her subsequent services in the interests of many institutions made her an international influence in educational affairs. In 1889 she was made a member of the Massachusetts Board of Education, in 1892 a member of the Massachusetts Board of Managers at the World's Fair, and advisory dean of the women's department of Chicago University, and she was long a trustee of the International Institute for Girls in Madrid.

PARAGUAY, an interior South American republic, lying between Bolivia, Brazil, and Argentina. The capital is Asunción.

Area and Population.—The area of Paraguay is not known, and the widely varying figures given—from 89,000 to 157,000 square miles—are hardly accounted for by the still undetermined boundary with Bolivia. An estimate published in 1902 placed the area at about 121,000 square miles. According to the enumeration of 1899 the population was about 635,000, of whom about 100,000 were Indians and most of the remainder mestizos. The war of 1865-70 almost exterminated the male inhabitants, but in 1899 males comprised about 47 per cent. of the whole population. The population of Asunción on July 1, 1902, was 51,719. Roman Catholicism is the state religion. Primary instruction is free, secular, and nominally compulsory. In respect of public instruction, Paraguay, as compared with other Latin-American countries, is remarkably progressive.

Government.—The executive authority rests with a president, who is chosen by an electoral college, and is assisted by a responsible ministry. The legislative power devolves upon a congress of two houses, the senate (50 members), and the chamber of deputies (100). The presidential office in 1902 was occupied successively by Señores Aceval, Carvallo, and Ezcurra (see paragraph Events of 1902). The army numbers about 1600 men.

Finance.—The gold peso is worth approximately one dollar in United States money; but Paraguayan finance is on a paper basis, and the value of the paper peso, the chief circulating medium, which was about 14 cents in 1900, has since declined to something less than 12 cents. In the fiscal year 1900 revenue and expenditure in currency amounted to 9,856,063 pesos and 8,122,139 pesos respectively. In the following year the revenue was 11,412,747 pesos (1,342,676 pesos gold), of which 9,930,348 pesos were derived from customs and 1,220,247 pesos from internal taxation. The revenue in 1882 was 810,506 pesos (having the same value in gold), and in 1890, 1,736,113 pesos (1,157,409 pesos gold).

According to a publication of the Asunción chamber of commerce, the outstanding foreign debt on December 31, 1901, was 4,787,077 pesos gold, and the internal debt 11,043,471 pesos paper (including 10,566,171 pesos of notes in circulation). The government, however, is debited with other amounts—to the Paraguayan Central Railway, Argentina, Brazil, etc.—which aggregate, in face value, nearly \$26,000,000.

Industries, Commerce, etc.—Cattle raising is the most important industry, and yerba maté, or Paraguay tea, the most important agricultural product. According to the Paraguayan bureau of statistics, the values in gold pesos of imports and exports have been respectively.

	1882	1890	1899	1900	1901	1902
Imports.....	1,320,326	2,721,443	2,147,837	2,655,741	3,003,657	2,050,000
Exports.....	1,650,679	2,900,729	2,500,000	2,707,074	2,529,306	3,232,652

The leading imports are textiles, wines, and rice; the chief exports, yerba maté, hides, timber, oranges, and tobacco. About one-half of the imports in 1901 were German, and one-fourth British. In 1902 the import trade was unsatisfactory, since in many instances the exceptionally high premium on gold—about one thousand per cent.—had rendered business impossible.

There is one railway, 156 miles in length, connecting Asunción with Pirapó. In 1900 the post-offices numbered 142.

Events of 1902.—In January, 1902, a political crisis at Asunción, growing out of the question of the presidential succession, resulted in the overthrow of the government and the resignation of President Emilio Aceval, who, in 1898, was elected for the term ending November 25, 1902. The trouble came about over the refusal of Señor Aceval to support the cause of Señor Guillermo Rios, the military, or "revolutionary," candidate for the presidency. On January 9 several "generals," leaders of the military group of the Republican party, threw the president into prison, where he remained until he resigned a few days later. As the congress hesitated to accept this enforced resignation, the generals hastened matters by opening fire on the legislators, killing one and wounding several, among the latter "one of the most renowned of Paraguay's Napoleons." But the promising ambitions of Señor Rios were not fulfilled, for at the election held about October 1, and afterwards ratified by the congress, Señor Juan Ezcurra, the minister of war, was raised by the Republican party to the post of chief magistrate. A competitor of Señor Ezcurra, Dr. Cecilio Baez, represented the Liberal party. Señor Manuel Dominguez, the minister for foreign affairs, was elected vice-president. The inauguration took place on November 25, 1902. At the end of the year the military oligarchy—Señor Ezcurra, who is himself a colonel, had a prominent part in the proceedings of the "generals"—was in full administrative control, but the political situation was anything but settled and it seemed quite possible that the new president, or, more properly, dictator, would not hold office throughout the constitutional term. From the resignation of Señor Aceval to the inauguration of Señor Ezcurra the chief executive, upon vote of the congress, was Señor Hector Carvallo, who had been vice-president.

A general arbitration treaty between Paraguay and Argentina was concluded November 6, 1899. Subsequently the treaty was amended, and on June 5, 1902, ratifications were finally exchanged. The treaty provides for the arbitration of "all controversies of whatever nature" which may arise between the two countries and "which do not affect the provisions of the constitution of either country."

PARALLAX, STELLAR. See ASTRONOMICAL PROGRESS.

PARKER, FRANCIS WAYLAND, an American educator, died on March 2, 1902. He was born in Bedford, N. H., October 9, 1837, worked on a farm, was a New England school teacher, became principal of a school at Carrolton, Greene County, Ill., and, unable there to enlist in the Federal army, entered the Fourth New Hampshire Infantry as a private. During his military service, wholly in the east, along the lower seaboard and in Virginia and North Carolina, he rose to the colonelcy of his regiment, and in August, 1865, was mustered out. On leave in 1864, he stumped New Hampshire for Lincoln. After the war, he resumed teaching, from 1872 to 1875 studied at the University of Berlin, and from 1875 to 1880 was superintendent of schools at Quincy, Mass., in the administration of which office he aroused wide interest, and, it is said, attracted to the inspection of the institutions under his charge more than 30,000 visitors. He was a supervisor of schools in Boston in 1880-83, and principal of the Cook County (later the Chicago) Normal School from 1883 to 1899. In 1899 he was elected the first president of the Chicago Institute, a school of pedagogy founded in that year. He was known for his individual application to educational problems of the methods of Pestalozzi and other theorists. In addition to his administrative work, he lectured much, and published *Talks on Teaching* (1883); *The Practical Teacher* (1884); *How to Study Geography* (1889); and other volumes.

PARKER, JOSEPH, an English clergyman, died November 28, 1902, in London. He was born April 9, 1830, at Hexham, Northumberland. Tutoring by private instructors was supplemented by a course at University College, London, and at the age of twenty-three years he became minister of a Congregational chapel in Banbury. The parish was in debt and he refused to leave it in that condition, when, after a few years, he received a call to a wealthy church in Manchester, but in 1858 the Manchester church proposed to pay off the debt and the call was accepted. He went to the old Poultry Chapel in London in 1869, and in 1874 the City Temple was

completed and opened to his growing congregation. One of the most remarkable features of his ministry was the noon-day service on Thursdays, which was often attended by 1000 people, mostly business men, who took the keenest interest in his eloquent discussions of questions of the hour. While at Manchester he received the honors of the chairmanship of the Lancashire Congregational Union and of the Manchester Congregational board, later filled corresponding offices in London, and was twice chairman of the Congregational Union of England and Wales. He was a voluminous writer, his *People's Bible* alone containing something like 750,000 words, and he was regarded as "almost a prophet" even by those who did not care for his striking style of extemporaneous speaking. Some of his works which demand mention are: *Ecce Deus*; *The Paraclete*; *To-Day's Bible*; *To-Day's Christ*; *Christian Profiles in a Pagan Mirror*; *A Preacher's Life*; *An Autobiography and an Album*.

PAUL, CHARLES KEGAN, an English publisher and author, died July 19, 1902. He was born at White Lackington, near Ilminster, Somerset, March 8, 1828, and studied at Eton and at Exeter College, Oxford. Influenced by the teachings of Frederic Maurice and Charles Kingsley, he took orders, becoming curate of Great Tew and later of Bloxam. In 1853 he was appointed master at Eton, and in 1862 assumed the vicarage of Sturminster in Dorsetshire. Twelve years later his Anglican opinions having given way to Positivist doctrines, he resigned his living, went to London, and engaged as a publisher's reader. He translated *Faust*, wrote the life of Godwin, and edited the *Letters* of Mary Wollstonecraft. In the publishing business, his high intellectual standards and keen literary taste were rather a hindrance to large pecuniary success. He showed a friendly disposition toward younger writers, published some of the early works of Stevenson and *The Egoist* of George Meredith. He also published Bodger's *English-Arabic Lexicon*, Hake's *Journals of Chinese Gordon*, and launched the *Nineteenth Century*. After his withdrawal from active life, his growing tendency toward the Church of Rome received an impetus from the reported miracles at Lourdes, and he formally entered that communion. During his leisure he translated Huysman's *En Route* and wrote a volume of *Memories*. His other works not already mentioned are: *Maria Drummond, a Sketch*; *Faith and Unfaith*; and *By the Wayside*.

PAUNCEFOTE, Right Hon. Sir JULIAN, First Baron Pauncefote of Preston, British ambassador to the United States, died in Washington, D. C., May 24, 1902. He was born in Munich, Bavaria, September 13, 1828, was educated in Paris, Geneva, and at Marlborough College, and was called to the bar in 1852. In 1865 he received his first important official appointment, that of attorney-general of Hong Kong, and in 1869 was made chief justice. His subsequent career, in which his legal abilities and large knowledge of British colonial affairs played an important part, was mostly divided between official service in London and the ambassadorship at Washington, in which latter position he had, according to unbiased judges, more to do with promoting friendly relations between the United States and Great Britain than any other ambassador to this country. After a short term as chief justice of the Leeward Islands (1873-74), he was appointed, in 1874, legal assistant under-secretary of state for the colonies, and in 1876 was made legal assistant under-secretary of state for foreign affairs. In 1887 he succeeded Lord Tenterden as permanent under-secretary of state for foreign affairs. After the enforced departure in 1888 of Lord Sackville-West, British minister at Washington, Pauncefote succeeded him and remained in that office for fourteen years, under conditions which for a large part of the time called for exceptional tact, insight, and large political views. In 1893 he was promoted to the rank of ambassador extraordinary and plenipotentiary. The issue of President Cleveland's Venezuelan message to Congress in 1895 aroused ill-feeling between Great Britain and this country, and it is within bounds to say that Lord Pauncefote's high personal character and official influence, especially the confidence reposed in him by the British government, were important factors in effecting a satisfactory and peaceful result. Afterwards, during the sittings of the Anglo-American Joint High Commission, as well as during the negotiations concerning the isthmian canal, whose friendly settlement was assured by the Hay-Pauncefote Treaty in 1901, his influence was potent for conciliation. In 1899 he was raised to the peerage, and in the same year was a delegate to the International Peace Conference at The Hague. To his efforts and to those of the American delegates was largely due the establishment of the permanent arbitration tribunal.

PAUPERISM. See CHARITY ORGANIZATION.

PAVEMENTS, STREETS, and ROADS. Recent notable features of street paving are the increasing use of bituminous macadam, and also of wood blocks carefully treated to prevent decay and to lessen disintegration by traffic. Asphalt continues in favor in many sections of the country, but its adoption has been retarded by the belief of engineers and municipal officials that an unduly high price was being maintained by a combination of the asphalt interests, and by unwarranted attempts

to prevent the use of asphalt from deposits not controlled by the combination. During 1902 the price of asphalt in a number of cities was reduced by competition or the fear of it, and perhaps by the financial embarrassments of the big asphalt companies. Thus far asphalt has been used but little in New England, nor has brick been extensively employed for pavements there. Nearer the paving brick producing centres that material is still the chief one employed for permanent work. Macadam is hardly classed with the permanent pavements, like asphalt, brick, wood, and stone, but it is hoped that the bituminous macadam will prove far more durable than the ordinary macadam, in which the binding material is powdered stone or clayey loam. Bituminous macadam is formed by thoroughly mixing broken stone of graded sizes and carefully prepared gas-works tar. The successively finer grades of stone are designed to fill the voids between the separate particles, while the tar coats each piece of stone and binds the whole together. The wood blocks for the more permanent wood pavements are treated with creosote or some other antiseptic, and in one process resin is added to decrease the porosity and increase the hardness of the hard pine blocks. Brick for paving use is a vitrified product, tough, hard, and of as uniform a composition as possible. Extended investigations of the manufacture and testing of paving brick have been carried on for a number of years past by and in behalf of the National Brick Manufacturers' Association (permanent headquarters, Indianapolis, Ind.). The association now has a committee on technical research which has submitted some valuable reports on paving brick.

Street Cleaning.—Bacterial studies of street dust in New York City show the beneficial effects of smooth pavements and thorough street cleaning. Agar culture plates were exposed for fifteen minutes at the curb level and six feet above it, and bacterial counts were made of the growths on the plates. The results were thus summarized by Dr. John M. Woodbury, commissioner of street cleaning, in his report for the third quarter of 1902:

"In places where there was a large amount of traffic, where pushcarts were in large numbers, in a tenement district densely populated, as many as 9600 colonies appeared in a fifteen-minute exposure. In another part of the city, where the pavement was asphalt, although the traffic at this point was quite heavy, the location residential and the avenue well flushed, only 54 colonies were found on a fifteen-minute exposure, while in another portion of the city, upon a well-cleaned, flushed asphalt pavement, where traffic is extremely light, and where the surrounding property is entirely residential, at six feet above the curb line but five colonies were found."

In all, there were seven series of observations, at six stations. Dr. Woodbury favors washing streets with hose to prevent street dust.

A paper on "The Sanitation of Road Traffic" was read before the Sanitary Congress at Manchester, England, in 1902, by Mr. E. G. Mawbey, an engineer of Leicester, England. (The lecture will probably appear in the *Journal of the Sanitary Institute*, 1903.) Mr. Mawbey took an extreme view of the dangers from street dirt and dust, but much that he said is doubtless justified by experimental and practical knowledge. Thus he says of street dirt:

"In dry weather, and with only moderate breezes, notwithstanding good ordinary scavenging and watering, this dry, complex, and more or less foul matter is blown about in the air we breathe, both indoors as well as in the open, and upon the cooked foods, sweets, fruits, etc., exposed for sale, and also into the milk served in open vessels. It is well known that the dust from street surfaces contains bacteria generated from the excretal and other organic and vegetable matters which are more or less injurious to the throat, lungs, and stomach, and also to the eyes as well as other organs, and perhaps to this foul matter is due the existence of many of the flies which are known to be carriers of infection."

To lessen the street dirt Mr. Mawbey wisely suggests the extension of hard, smooth, well-jointed, and readily cleansed pavements; the extension "of the system of thoroughly washing street pavements"; street sweeping at night, preceded by sprinkling; frequent sweeping in densely populated districts; and copious watering and deodorizing of certain streets and public places in hot weather.

The street cleaning department of the city of Detroit has a reputation for good work. Its methods and results were described by Mr. D. W. H. Moreland, commissioner of public works, in a paper before the League of American Municipalities (see *Proceedings* for 1902, Des Moines, Ia.). In brief, the work in the centre of the city is done by about 100 men in white uniforms, with brooms, shovels, and pushcarts, while the remainder of the city is cleaned largely by machines. During the year ending June 30, 1902, a total of \$158,000 was expended for street cleaning, including new sweeping machines and hand tools.

Road improvements in suburban and rural districts are being pushed forward in many sections of the country. Either ordinary macadam or gravel is used for this purpose, the former being more permanent and also more expensive than the latter.

State road construction, or, at least, State aid with more or less State supervision, still continues in Massachusetts, Connecticut, New York, and New Jersey, and some other States are directly or indirectly furthering highway improvements. In Maryland important investigations of the conditions and needs of the roads of the State and valuable studies of road-making materials, have been entrusted by the legislature to the State Geological Survey. Convict labor is extensively employed on road work in the South. An important study of this practice has been made by Mr. J. A. Holmes (*Year Book of the United States Department of Agriculture*, Washington, 1902). In this paper, "Road Building with Convict Labor in the Southern States," Mr. Holmes describes the management of the convict road force, and also roads built by convicts in Georgia, Tennessee, and the Carolinas. He states, at the outset, that the belief prevails in the Southern States, "that perhaps the best way in which a criminal can benefit the community he has injured is in helping to improve its public highways." In most of the Southern States the employment of convict labor on the roads has been practiced for a number of years, and its desirability is accepted as beyond question, particularly as this class of work is said to be unattractive to hired labor in the South. The extent of the practice, and also some interesting financial statistics relating thereto, are shown by the accompanying table from Mr. Holmes's paper.

EMPLOYMENT OF CONVICT LABOR ON ROADS IN THE SOUTHERN STATES.

(From *Year Book*, Department of Agriculture, 1902.)

STATES.	Number of Counties.	Counties Using Convicts on Public Roads.	Average Number of Convicts on Public Roads During 1900.	Average Cost Guard, Inc and Maintenance per Convict per Day on Roads.	Average Cost of Prisoner per Day for Keeping in County Jails.	Number of Prisoners Usually Kept in County Jails, and Not Used on Roads.	Average Cost of Hired Road Labor Per Day. Virginia.....	100	5	23	.38	.30	329	.80	5,000	72,380
Total or average.....	1,138	287	4,377	\$0.33‡	\$0.35‡	7,361§	\$0.85	\$985,823	\$1,739,807

* In estimating the value of this convict labor the per diem paid ordinary laborers in the respective States as shown in the column giving the average cost of hired road labor per day is taken as a basis; and it is assumed that 275 work days may be reasonably counted upon for these States.

† In determining this average the figures for Alabama and Arkansas were omitted, owing to the probability that certain expenses connected with the maintenance of the teams have been, by mistake, included in the figures reported from these States.

‡ In determining this average the figures for Arkansas have been omitted as being abnormally high.

§ Concerning this total number of prisoners in the county jails of these 12 States, it should be stated that an unknown proportion, probably in some States at least 50%, of these are persons awaiting trial and unable to give bond. This situation may continue for from a few days to several months. The remainder of these prisoners have already been tried and convicted, but remain in jail idle, at the expense of the county, for the reason that no employment is provided for them.

PEARCE, CHARLES EDWARD, former congressman from Missouri, died in St. Louis, Mo., January 30, 1902. He was born in Whitesboro, N. Y., May 29, 1842, and in 1863 graduated at Union College. He then enlisted in the Union army and served as captain and major of the Sixteenth New York Heavy Artillery. He was present at the battles before Petersburg and Richmond and the capture of Fort Fisher, was on the staff of Major-General Terry, and acted for a time as provost-marshal-general of the Eastern District of North Carolina. In 1866 he removed to St. Louis, was admitted to the bar in 1867, was commander of the St. Louis National Guard in 1875, and was organizer and first colonel of the First Regiment (militia) in that city. In 1888 he was a delegate to the Republican National Convention, served as chairman of the Sioux Treaty Commission in 1891, traveled extensively in China, Japan, and India to study economic conditions, and from 1897-1901 was Republican Congressman from the twelfth Missouri district.

PELEWS. These islands are treated under CAROLINE ISLANDS.

PENNOYER, SYLVESTER, ex-governor of Oregon, died at Portland in that State on May 30, 1902. He was born at Groton, N. Y., July 6, 1831, and graduated at the Harvard Law School in 1854. Removing soon afterwards to Oregon, he taught school, and in 1862 became a lumber merchant in Portland. A few years afterwards he attracted attention by his articles in the *Oregon Herald*, and from that time was recognized as an able writer on current political topics. In his articles and speeches he adopted a very sympathetic attitude toward workmen, and by that means became their spokesman in the agitation against Chinese immigration. In 1886 he was elected governor of Oregon as a Democrat, although all the other successful State candidates were on the Republican ticket. He held the governorship for two terms, and in office showed great decision of character, occasionally offending against official propriety, as in the case of his message to President Cleveland warning him against interference when the latter proposed a plan to end railroad strikes in Oregon. He vetoed laws for the issue of non-taxable bonds for certain purposes, showing his friendship for the workman in this and other public acts, and winking officially at the riots of the Oregon Pacific Railroad employees. He was not so strict in fulfilling his ante-election promises regarding Chinese immigration as was expected of him. His popularity after his retirement from the governorship was attested by his election as mayor of Portland in 1896.

PENNSYLVANIA, an eastern State of the United States, has an area of 45,215 square miles. The capital is Harrisburg. Pennsylvania was one of the original thirteen States of the Union. The population, in 1900, was 6,302,115, and in June, 1902, as estimated by the government actuary, 6,522,000. The populations of the five largest cities in 1900 were: Philadelphia, the third largest city in the United States, 1,293,697, an increase of 246,733 since 1890; Pittsburg, 321,616; Allegheny, 129,896; Scranton, 102,026; and Reading, 78,961.

Finance.—The balance on hand, December 1, 1901, was \$7,708,022.18. The total receipts of the treasury during the year were \$22,947,890.65. The total expenditures during the year were \$17,787,106.19, leaving a balance on hand, November 30, 1902, of \$12,868,806.64. The total debt on December 1, 1902, was \$4,806,649.02, of which \$4,672,500 was funded and \$134,149.02 was unfunded. The debt was reduced by the amount of \$2,008,650 during the year.

Agriculture and Industries.—The principal field crops of Pennsylvania for 1902, according to the *Crop Reporter*, were: Corn, 1,486,383 acres, 53,658,426 bushels, \$31,121,887; winter wheat, 1,558,745 acres, 24,628,171 bushels, \$17,978,565; oats, 1,233,868 acres, 45,036,182 bushels, \$15,312,302; buckwheat, 247,250 acres, 5,475,225 bushels, \$2,729,887; potatoes, 246,619 acres, 20,469,377 bushels, \$11,667,545; hay, 3,103,363 acres, 3,693,002 tons, \$51,702,028; tobacco, 17,269 acres, 22,017,975 pounds, \$1,761,438.

Notwithstanding the practical cessation of anthracite mining from May until October on account of the strike of the United Mine Workers of America (see **STRIKES**, paragraph Anthracite Coal Strike) the State of Pennsylvania easily maintained its place as the first producer of coal. The output in 1902 was approximately 45,000,000 short tons of anthracite and 95,000,000 short tons of bituminous coal. The Pittsburg district increased its production from 82,099,906 tons in 1901 to about 100,000,000 tons in 1902—over one-third the entire production of bituminous coal in the United States. About one-half the coke produced in the United States was made in this district. Coke and coal together were worth at the ovens and mines over half a billion dollars. There were about 35,000 coking ovens in operation in the Connellsville district. The Pittsburg Coal Company opened a number of new mines, and the mines along the Pennsylvania Railroad increased their output about 30 per cent. Iron and steel works were crowded with orders months ahead. Pig-iron production amounted, in 1900, to 7,343,257 tons, and in 1902 8,117,800 tons, equal to 45.5 per cent. of the total production of the United States. Bessemer steel production increased in the same period from 4,293,437 tons to 4,379,516 tons. The production of petroleum was 31,201,165 barrels—a slight decrease. Wells producing numbered 7722. At end of the year 582 new wells were being drilled. More new textile mills were built in Pennsylvania than in any other State. Seven cotton mills, 7 woollen mills, 16 silk mills, and 27 knitting mills were built. Freight traffic on the railroads was enormous. More than 1,929,000 cars were moved over the middle division of the Pennsylvania Railroad—a world record for freight handling. Between Pittsburg and New York traffic average was 23,764,530 tons per mile of road. Average freight earnings were \$116,479 per mile. Wages of the employees were advanced 10 per cent. in December.

Conventions and Platforms.—The Republican State convention was held at Harrisburg on June 11. It was under the control of Senator Quay, who brought about the nomination of Judge Pennypacker for governor, and secured the defeat of Attorney-General Elkin, who was supported by Governor Stone and the "ripper" politicians of Pittsburg and Allegheny. The hope of the Democrats that the bitter-

ness of the fight between Quay and his former henchman, Elkin, would lead to an open rupture in the Republican party was not realized. The platform endorsed the President, recommended his re-election, favored reciprocity with Cuba, and suggested reforms in the State suffrage plan. The administration policy in the Philippines was indorsed. Reference was made to the policy of protection in the following manner: "We demand that this policy in so far as it protects and tends to develop the industries and interests of the American people shall be firmly adhered to." Concerning trusts and combinations the platform expressed approval of the President's efforts to "check the growth of unlawful combinations intended to raise the price of commodities at the expense of the consumer," and recommended that such action be taken in similar cases. The platform also contained the following: "We place ourselves on record as favoring the passage of wise immigration laws to the end that anarchy may be forever driven from this country, and that the American workingman shall be protected against unfair labor from abroad."

The Democratic State Convention was held at Erie on June 25. The nominee for governor, ex-Governor Pattison, received the honor for the third time in twenty years. National politics were purposely omitted from the platform, State issues being considered paramount. The Republican State administration was unqualifiedly condemned. Promises were extended to the effect that in the event of Democratic success, there would be a clean sweeping away of legislative corruption. It was also promised that, if the party came into power, there would certainly be equal and just laws, pure and economical administration, ballot reform brought about by a uniform primary election law, personal registration in all cities, a secret ballot, and the appointment of overseers, ballot boxes being made available for public inspection on demand. Regarding the coal strike, the platform declared that: "We deplore the existence of the labor trouble now affecting important industries and a large portion of the people of our State, and express the earnest hope that, through concession, moderation, and fair dealing, an early adjustment may be reached."

The Union State Convention was held on September 3. There was a lively discussion regarding the merits and demerits of the Republican and Democratic candidates for governor. Two tickets were nominated, but both were declared invalid by a legal decision. The gubernatorial candidate of the Socialist-Labor party was William Adams; of the Prohibitionists, S. C. Swallow.

Elections.—At the regular biennial State election, held November 4, 1902, the officers voted for were governor, lieutenant-governor, and secretary of the commonwealth, the Republicans, of course, securing them all. The vote for governor was Pennypacker (Rep.), 592,867; Pattison (Dem.), 436,457, giving Pennypacker a plurality of 156,410. The campaign was essentially an anti-Quay contest, and the success of his candidate, Pennypacker, meant an endorsement of Quay's control. The Democrats attempted to win over the more liberal Republicans by assuming an attitude in strong opposition to the "ripper" legislation, passed by the previous legislature, as well as the corrupt manipulation of municipal government, and giving away of valuable franchises and the administration of public offices for private profit. The truth of the assertion that Quay exercises as complete control over the Democratic party as over his own Republican cohorts was amply proven by the results of the contest. The very name of reform has become odious in Pennsylvania, because so many times reformers themselves have proven to be merely disgruntled satellites of Quay, who aimed to improve not the public service, but their own condition. Though Mr. Pattison has twice served with honor and distinction as governor of the State, his deserved popularity was not sufficient to carry the election in the face of such tremendous odds. The State legislature for 1903 will consist of 40 Republicans and 10 Democrats in the senate, and 159 Republicans and 45 Democrats in the house. The people of Pittsburg resented the interference in local affairs by the "ripper" legislation of 1901, and defeated the regular Republican organization under the leadership of Senator Flinn, by about 8000 votes. The recorder, J. O. Brown, will hold over by appointment, however, until April 1, 1903.

State Officers.—For 1902: Governor, William A. Stone; lieutenant-governor, J. P. S. Gobin; secretary of the commonwealth, William W. Griest; treasurer, Frank G. Harris; auditor, E. B. Hardenbergh; attorney-general, John P. Elkin; superintendent of public instruction, N. C. Schaeffer; insurance commissioner, Israel W. Durham; secretary of agriculture, John Hamilton; secretary of internal affairs, James W. Latta—all Republicans except Schaeffer. For 1903: Governor, Samuel W. Pennypacker, elected for four years, term ending January, 1907; lieutenant-governor, William M. Brown; secretary of the commonwealth, William W. Griest; treasurer, Frank G. Harris, term two years, ending January, 1904; auditor, E. B. Hardenbergh, term three years, ending May, 1904; attorney-general, John P. Elkin, until January 20, 1903; superintendent of public instruction, N. C. Schaeffer, until January 20, 1903; insurance commissioner, Israel W. Durham, until January 20, 1903; secretary

of agriculture, John Hamilton, until January 20, 1903; secretary of internal affairs, Isaac B. Brown, until May, 1907—all Republicans except Schaeffer.

Supreme Court: Chief justice, J. Brewster McCollum; associate justices, James T. Mitchell, D. Newlin Fell, John Dean, J. Hay Brown, William P. Potter, and S. Leslie Mestrezat—all Republicans except McCollum and Mestrezat, Democrats.

For congressional representatives, see UNITED STATES (paragraph Congressional Representatives).

PENNSYLVANIA, UNIVERSITY OF (founded as a college in 1755), had an enrollment for 1901-02 of 2573, the same number as that of the previous year. Of this number the college enrollment was 1019, which is a larger proportion than with most of our larger universities. The department of law enrolled 386; of philosophy, 179; of medicine, 542; of dentistry, 305; of veterinary medicine, 78. Pennsylvania has taken a prominent part in raising the standards of medical education, and during the past year the requirements of admission to the medical school have been raised, with a consequent increase of tuition charges and decrease of attendance. More than 50 per cent. of medical students are now college graduates. The university authorities are now requesting that the State raise the standards of admission to the medical profession, and that it also set standards of admission to the various schools of medicine as in the case of law. In the previous year the university adopted the policy of allowing the last year of undergraduate work to be elected in the professional schools, with the result that in September, 1901, nineteen students had thus entered the medical school. During 1902 the policy of allowing a three-year A.B. course was definitely adopted, though at the opening of the fall term 90 per cent. elected the full four-year course. At the same time an effort is being made to increase the length of the college year by elimination of holidays and prolongation of the term. During the scholastic year the university had received in gifts \$936,851, the largest amount ever received in a single year. Half of this was in real estate bequeathed by Joseph M. Bennett, a portion of it for the Wharton School of Finance from its founder, who has also donated land and given pledges for the erection of a new building. New medical laboratories have been added and new dormitories are being planned. The total teaching staff was increased by seven during the year and now numbers 272. Prof. Martin T. Brumbaugh, of the department of education, returned from his work as the first commissioner of education for the island of Porto Rico, and his place was taken by Prof. Samuel McCune Lindsay of the chair of sociology. The student registration for the new scholastic year was 2549 in November, 1902.

PENSIONS. The report of the commissioner of pensions for the fiscal year ending June 30, 1902, shows a total enrollment of 999,446 pensioners, an increase over the preceding year of 1711. There were added to the rolls during the year 43,952 pensioners, and there were dropped 42,241. The annual value of the pension roll on June 30, 1902, exclusive of accrued first payments and administrative expenses, was \$132,152,800, as against \$131,568,216 the year previous. The total amount paid for pensions, including accrued first payments, was \$137,504,267.99 in 1902 and \$138,531,483.84 in 1901. Administrative expenses were \$3,831,378.96 in 1902 and \$3,868,795.44 in 1901. There were pending on June 30, 1902, 339,436 claims of all classes, as against 403,569 in 1901. Of these claims, 34,433 were on account of the war with Spain, 63,227 were original Civil War claims, and 182,367 were for increase of Civil War pensions. Special pension grants were passed by Congress, with an annual value in 1901 of \$120,192 and in 1902 of \$182,825. The present average value of each pension is \$132.23 annually. The States having the greatest number of pensioners are: Ohio, 104,060, to whom \$15,104,092.54 was paid in 1902; Pennsylvania, 103,697, drawing \$13,322,286.95; New York, 88,269, drawing \$11,680,011.79; Illinois, 72,026, drawing \$9,746,062.12; and Missouri, 52,813, drawing \$7,081,492.02. On June 30, 1902, there were on the pension rolls four daughters of soldiers of the Revolutionary War, and also four widows pensioned by special act. There was at the same time one surviving soldier of the War of 1812, Hiram Cronk, of Oneida County, N. Y., 102 years of age. The following amounts have been paid to soldiers, their widows, minor children, and dependent relatives on account of all wars in which the United States has been engaged: Revolutionary War, \$70,000,000 (estimated); War of 1812 (for service only), \$45,025,297.09; Indian wars, 1832-42 (service only), \$5,814,206.53; war with Mexico (service only), \$31,861,337.57; the Civil War, \$2,744,878,276.16; war with Spain, \$3,275,184.10; or a total of \$2,900,854,301.45. From the figures given for the Civil War should be deducted \$16,000,000, estimated to have been paid for disabilities, incurred in the Indian and Mexican wars and the War of 1812, thus leaving as a total paid on account of the Civil War, exclusive of expenses for administration and soldiers' homes, \$2,728,878,276.16. The following table shows the amounts paid for army and navy pensions and for administrative expenses for the fiscal years 1900, 1901, and 1902, and shows also the total disburse-

ment for pensions since 1790. It will be noted that the present yearly payments are greater by over \$40,000,000 than the aggregate pensions paid between 1790 and 1865.

	Army Pensions.	Navy Pensions.	Administrative Expenses.	Total.
Fiscal year 1900.	\$134,700,597.24	\$3,761,533.41	\$3,841,706.74	\$142,303,837.39
Fiscal year 1901.	134,743,790.81	3,787,693.03	3,868,795.44	142,400,279.28
Fiscal year 1902.	133,655,245.75	3,849,022.24	3,831,378.96	141,335,646.95
From July 1, 1790, to June 30, 1865	96,445,444.23	96,445,444.23
From July 1, 1865, to June 30, 1902	2,741,659,504.38	62,749,352.84	91,654,717.92	2,896,063,575.14
From July 1, 1790, to June 30, 1902	2,992,509,019.37

Pension Administration.—The continued criticism of the administration of the pension bureau, led, early in the year, directly or indirectly, to the resignation of Henry Clay Evans, appointed commissioner by President McKinley April 1, 1897, and to the appointment in his stead, on May 10, 1902, of Eugene F. Ware, of Kansas. The methods of Mr. Evans, had, it was understood, met the approval of President McKinley during his lifetime, and that President Roosevelt also approved them appeared evident from his immediate appointment of Mr. Evans, upon his resignation, to the important office of consul-general at London. For this reason the press generally considered that the executive had yielded, or permitted Mr. Evans to yield, to political pressure, and without any advantage accruing to the public. The criticisms that had been brought against Mr. Evans, during his incumbency of the office, by pensioners, would-be pensioners, and by the Grand Army of the Republic, were in effect that he was over suspicious, made unwarranted accusations of fraud, and interpreted the pension laws narrowly and gingerly instead of sympathetically and liberally.

PENSIONS FOR WORKINGMEN. The German imperial government compels every wage-earner receiving not more than \$500 per annum, to pay a certain part of his wages over to the proper government officials to be administered as a benefit fund. The employers are required to make similar payments for each one of their employees. This law affects about 12,000,000 persons. In return for the contribution workers are guaranteed (1) a pension for disability; (2) an old-age pension to begin at seventy; (3) medical attendance; (4) in certain cases the repayment of the contributions paid in. No one can draw the old-age pension unless he is seventy years old and has paid contributions for 1200 weeks. It consists of a payment of \$12.50 per annum from the state besides the sum which is the result of the worker's contributions. The latter sum depends upon his wages. Workmen are divided into five classes as follows:

CLASS.	Annual Wages.	Yearly Sum Drawn From Contributed Fund.	Total Annual Pension.
I.....	\$37.50	\$15.00	\$27.50
II.....	\$37.50 to \$137.50	22.50	35.00
III.....	\$137.50 to \$212.50	30.00	42.50
IV.....	\$212.50 to \$287.50	37.50	50.00
V.....	Above \$287.50	45.00	57.50

The pension for incapacity to go on working is granted only at the end of twenty-seven weeks of sickness and then only when a speedy recovery seems unlikely. The worker must have paid his contribution for 200 weeks if it is compulsory, and for 500 weeks if it is optional. The pension is withdrawn if the worker's disability arises from any crime or misdemeanor or voluntary mutilation. The disability pension also has two parts, the one fixed, and the other varying as in the case of old-age pensions. The minimum is \$36.25 per annum; the maximum, \$163.75. Pensions are paid at post-offices on orders issued by the insurance officers appointed to watch over the health of the workers and to impose medical treatment upon them when they deem it necessary, whether to effect a cure or to prevent disease. The officials are trying to eradicate tuberculosis, and to have made some progress, it is thought. The system is worked by means of cards upon which the worker or his employer places special stamps purchased at the post-office. When a card has reached a certain face value it is turned over by the police to the insurance officers to be placed to the credit of the worker, whose name it bears. The measure is unpopular, and could the workmen express their will, they would amend it so as to do away with the compulsory contributions from the employee, and compel the State and the employer to bear all the burden. The grand duchy of Luxemburg enacted a similar law in 1901, and in France an attempt was made in 1902 to put through a pension

law but without success. Statistics show that in spite of official watchfulness the law tends to increase sickness and disability "for revenue only."

The Metropolitan Street Railway Company of New York inaugurated a system of pensions taking effect July 1, 1902, "to preserve the future welfare of aged and infirm employees, and to recognize efficient and loyal service." The system affects all employees whose maximum wages have not exceeded \$1200. Seventy years is the age for compulsory retirement, and those between sixty-five and seventy who become unable to work may retire with a pension. The allowances are as follows: For thirty-five years or more of continuous service, 30 per cent. on the same basis; and for twenty-five years of continuous service, 25 per cent. The fund from which these payments are to be made is approximated by the company, and no contributions are required of the men. The company employs about 15,000 men, nearly all of whom come under the provisions of the plan. This is the first example in this country of a pension system for street railway employees, and has brought out favorable comments from all sides. In December, 1902, the Standard Oil Company board of directors voted to grant old-age pensions, beginning January 1, 1903, to the employees of the company. High-salaried officials are affected as well as unskilled laborers. The general plan is that followed out by the various railroad companies in pensioning superannuated employees. A new feature is added which allows any employee sixty-four years old having served the company twenty-five years, to retire on half pay for one year, after which the regular pension will be paid. The regular pension is one-fourth of the salary received at the time of retirement, and will be paid to all sixty-five years old who have served the company for twenty-five years. Every employee, whether president or day laborer is included. One of the high officials immediately gave notice that he wished to take advantage of the rule. This is the first case in the United States of a "trust" giving pensions to its employees. Many of the industrial corporations of Germany and France give old-age pensions, but they invariably confine them to low-salaried workers, and require the men to contribute a certain percentage of their wages toward the fund. The inclusion of high-salaried officials in the Standard Oil scheme has called out sharp criticism. As indicated, all the more important railroad companies in the United States give old-age and disability pensions. In the beginning the pension system was based on contributions from the employees. The later schemes have been somewhat more liberal in the provision for payments and in the age and service requirements. On the first of January, 1901, the Chicago and Northwestern set aside \$200,000 for a pension fund. On July 1, 1901, the Illinois Central followed suit with an appropriation of \$250,000. Most roads put the age limit at seventy years and the service limit at thirty or forty years, but make provision for retirement at sixty-five at the discretion of the pension board. The Delaware, Lackawanna and Western appropriated \$50,000 for a pension system on March 1, 1902. Its terms are somewhat more liberal in that only twenty-five years' service is required, and some employees may be retired between the ages of sixty and sixty-five. On May 21, the Philadelphia and Reading Company followed with a similar plan. Generally the amount of the pension is one per cent. per year of service of the average monthly wage for the last ten years of service. The granting of old-age pensions is regarded by most people as a liberal and benevolent policy on the part of great corporations. Mr. W. J. Ghent, in *Our Benevolent Feudalism*, is much inclined to doubt. He says: "The chances of a railway employee reaching the age of sixty-five or seventy years are about equal to the chances of winning a large sum at policy. Discharges are frequent and arbitrary and usually there is no appeal. Aside from this the casualties are enormous. Of the 181,198 railroad workers classed as trainmen employed throughout the country in 1900, 1396 (or one in every 138) were killed, and 17,571 (or one in every 10.8) injured. The corrected figures for 1901 show about the same percentages. Of the 209,043 trainmen, 1537 (or one in 136) were killed, and 16,715 (or one in every 12.5) were injured." Accidents are few on the Metropolitan Street Railway, but discharges are so frequent that it is estimated that not more than a dozen men now employed are entitled to pensions. Statistics bear out the opinion that few employees meet the rigid requirements of age and service. Mr. Ghent says: "The pension system is not a conspicuously expensive one, for the numbers of workmen who live long enough to avail themselves of its benefits are but scant. The sums paid out by the Baltimore and Ohio Railroad Relief Department in eighteen years average \$31,185.75 yearly—about the salary of a first vice-president—and the employees themselves have borne a considerable part of the expense. A total of 697 pensions has been granted during this time, but 365 of the beneficiaries have considerably died, and thus reduced the expenses." Some object that a pension, no part of which is contributed by the beneficiary, will tend to pauperize him. So long as the securing of a pension is so uncertain, and the amount going to the workman so small, there appears no reason for apprehension on that score.

PERKINS, WILLIAM OSCAR, an American musician, well-known in England and America as conductor, composer, and bass-singer, died in Boston, Mass., January 13, 1902. He was born in Stockbridge, Vt., May 23, 1831, and was educated at the Kimball Union Academy from which he graduated in 1854, and at Harvard University. He entered the Boston Music School in 1854 to improve his remarkable inherited musical talents, organized in 1855 the Mendelssohn Vocal Quartet which made a successful concert tour through the New England and Middle States, and after two years' labor as teacher in the high school of New Brunswick, N. J., returned to Boston and engaged actively in teaching vocal and instrumental music. He became distinguished as a choral conductor, was made director of the choir of the Boston Music Hall in 1858, and conducted at many conventions and musical festivals in the United States and Canada. After two years' study and travel in Europe he returned to Boston in 1872, where he lived until his removal to New York City in 1882. From 1886 to 1894 he resided in London, where he was constantly busied with literary and musical work. His pupils include many vocalists well known on the concert and operatic stage. He lectured on musical and political topics, and contributed widely to periodical literature. His first published work, *The Choral Harmony* (1859), was succeeded by over sixty volumes of musical writings.

PERSEUS, NEW STAR IN. See **ASTRONOMICAL PROGRESS.**

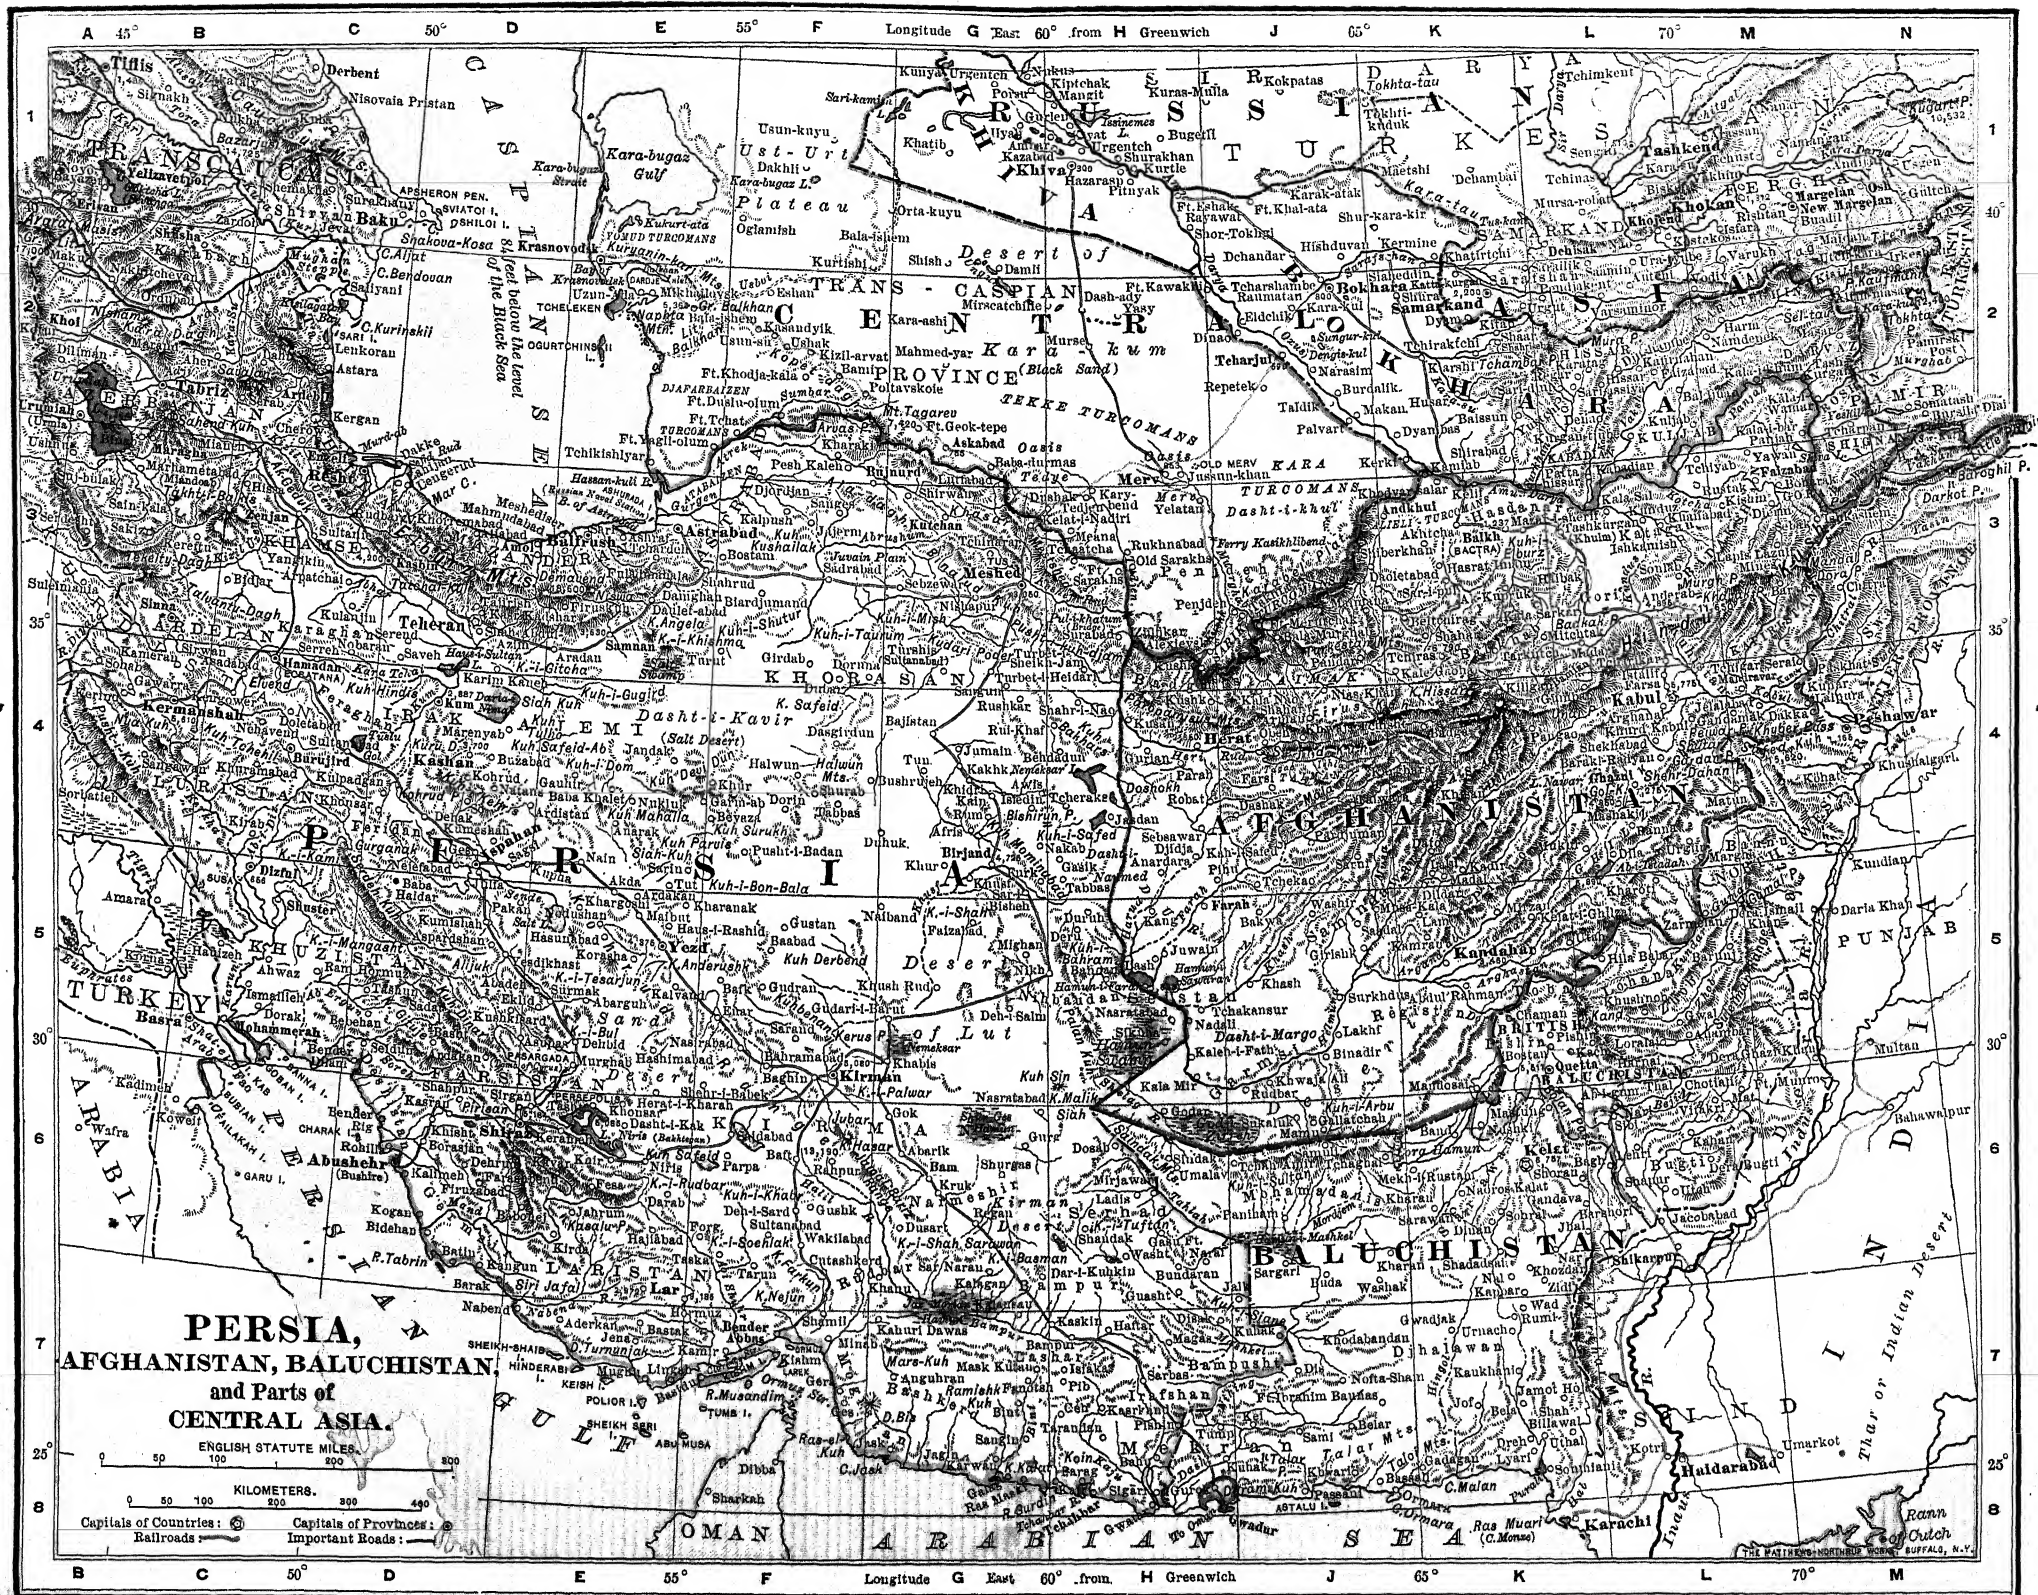

PERSIA, an Asiatic monarchy extending from the Caspian Sea to the Gulf of Oman. The capital is Teheran.

Area, Population, etc.—The estimated area is about 628,000 square miles and the estimated population between 9,000,000 and 9,500,000. The largest cities are Teheran with a population of 250,000, Tabriz 180,000, Ispahan 80,000. Nearly 90 per cent. of the inhabitants are Mohammedans of the Shiah sect; the rest are Sunnites, with the exception of 45,000 Armenians, 25,000 Nestorian Christians, 35,000 Jews, and less than 10,000 Parsees. Education is in a backward condition, and though there are a large number of schools where instruction is imparted in religion, literature, and a modicum of science, a reading knowledge of the Koran is the exclusive training for the great majority of the people. The administration of justice is in the hands of the imperial governors and the priesthood.

Government, Finance, etc.—The shah rules as absolute monarch in accordance with the spirit and precepts of the Koran. There is a ministry after the European model, but the real power rests in the hands of the grand-vizier. This official since 1898 has been Mirza Ali Asghar Khan, an astute and resourceful politician. The country is divided into thirty-three provinces under governors-general appointed by the shah, but it is estimated that there are nearly 2,500,000 nomads living under their own chiefs, whom, however, the central government recognizes and holds responsible for the collection of the tribal tribute. More than 80 per cent. of the revenue is derived by direct taxation, the burden falling most heavily on the lowest classes of the population. In 1898-99 the public income was about £1,500,000; in 1899-1900 the revenue was estimated at a somewhat smaller sum, owing to the depreciation of silver. The public debt consists of two Russian loans, one of 22,550,000 rubles in gold, negotiated in 1900, and payable in seventy-five years, the loan being secured by the customs duties of the entire country with the exception of the province of Farsistan and the ports on the Persian Gulf; the other of 10,000,000 rubles in gold, also for seventy-five years, was contracted in March, 1902, through the agency of the Discount and Loan Bank of Persia, an institution under Russian control. In the sharp conflict that is now in progress between Russia and Great Britain for supremacy in Persia, the field of public finance has been practically monopolized by Russia, which in return for its loans has been careful to secure adequate remuneration, as in the case of the latest loan, when the Discount Bank was granted concession for the construction and control of a railway from the Caucasian frontier through Tabriz to Kazvin, about 150 miles west of Teheran. Late in 1902 the government entered upon a scheme of financial reform with the assistance of a large number of Belgian administrators. One of their first measures was to reorganize the customs in the Persian Gulf in such a way as to interfere seriously with British trade, and it soon became apparent that the Belgian commissioners were controlled by foreign influence practically, if not openly, anti-British.

The strength of the army is placed at 105,500 men, but the regular army does not exceed 24,500. Even the latter are poorly trained and poorly equipped and have little fighting value. The only really effective Persian regiment is under the command of a Russian military officer, who is not responsible to the Persian war office.

Industry and Commerce.—The agricultural products comprise cereals, cotton, sugar, opium, and tobacco. The country possesses valuable mineral resources, including petroleum, coal, iron, copper, and lead, but any considerable development of

mining is prevented by the lack of transportation facilities. Mining operations were commenced in the winter of 1900-01 by a Russian company in the northern part of the province of Azerbaijan, and in April, 1902, it was reported that the Persian government had granted to a British subject a concession to work the oil beds of the Kerkhah Valley, in Khuzistan, western Persia, and to lay a pipe line to tide-water. The development of petroleum in this region, it was stated, would probably expose the Russian oil companies to dangerous competition. The most important manufactures are silk and carpets. The pearl fisheries in the Persian Gulf centre about Bahrein and Lingah, and the value of the annual output is estimated as ranging from \$1,000,000 to \$1,500,000. The principal articles of import are textiles, hardware, petroleum, sugar, tea, coffee, and drugs. The exports consist principally of opium, pearls, fruits, gums, horses, cereals, wool, and tobacco. In 1901 the commerce of the Persian Gulf comprised imports to the value of £2,770,964 and exports £1,420,759. Of the total amount of imports, the British, including under that term merchants of Great Britain and native Indian traders, contributed more than 73 per cent. In the north the ascendancy of the Russians is just as marked, so that of the total trade of the entire country, amounting in 1901-02 to £5,584,000 for imports and about £2,400,000 for exports, Russia contributed about 55 per cent. and Great Britain 25 per cent. An agreement between the Persian and Russian governments covering the ten-year period from the accession of the present shah (May 1, 1896) gives to Russia the exclusive right to construct railroads in the country. Russia so far has not availed herself of the opportunity, but the railway concession to the Discount Bank of Persia mentioned above may be regarded as the beginning of Russian enterprise in that direction.

Political History.—During 1902, as during the few years preceding, British influence in Persia seemed to be on the wane. Indeed, from the point of view of the British, Persian history for a number of years has been for them a long record of lost opportunities. On the other hand, Russian influence is constantly advancing: Russia controls Persian finance; she controls the commerce of northern Persia, and is constantly extending southward; the only good roads in northern Persia were built and maintained by Russia, and the only regiment in the Persian army that seems to be of any real military use has been developed and is commanded by a Russian general who is not even under the command of the Persian war office. Little by little Russia is approaching India, and when she reaches the waters of the Arabian Sea, as indeed it seems she must, if the policy of Great Britain in the Middle East is not soon strengthened, another Port Arthur or Dalny will rise up as a menace to British commerce and British power, and perhaps to the peace of the world. More than a century and a half ago the author of the apocryphal testament of Peter the Great wrote: "Hasten the decadence of Persia; penetrate to the Persian Gulf; re-establish the ancient commerce of the Levant, and advance to the Indies, which are the treasure house of the world." This plan seems ever since to have existed in the minds of Russian statesmen, and it is now that its consummation begins to seem possible. On the other hand, the policy of Great Britain, the policy of peace, seems to have been unwise. For years the British have sought to strengthen and centralize the Persian government, although the existing dynasty is essentially foreign and is hated by many of the tribes, especially in the south and west. In seeking to strengthen and guarantee the independence of the central government, Great Britain has alienated these tribes, who might now stand against Russian invasion had the British in some degree assisted them in obtaining a certain amount of self-government. The central government which Great Britain has helped to strengthen is now apparently being bought over bodily by the Russians, and so Great Britain's good offices are turning against her. Of late, however, public men in England have come to realize the danger that threatens British interests in Persia. So long as Russian ambition was directed towards gaining control of the central government, the peril to Great Britain was deemed distant and problematic, but the advance of Russia into southern Persia, the peculiar sphere of Great Britain, and the endeavor of the former nation to obtain an outlet on the Persian Gulf, brought the question nearer home. The establishment in 1901 of a line of steamships between Odessa and the gulf, with a government subsidy, could not but prepare the way for the demand by Russia of a harbor on that coast. In regard to this question of the Persian Gulf, Sir Edward Grey, the well-known authority on foreign affairs, and Lord Cranborne, the British under-secretary of state for foreign affairs, have pronounced that Great Britain's policy should be that of maintaining the *status quo*. The former said "we ought to consolidate our influence by the extension of our trade interests, and these, after all, become a great vested right;" while Lord Cranborne declared that British interests in Persia are "of the highest political order—vast commercial interests which it is our wish and our duty to maintain." Neither believed that such a policy would lead to unfriendly relations with Russia, but Lord Cranborne said that such relations were "not to be

sought at the cost of any treaty rights we possess;" he added in regard to the policy for the integrity of Persia, upon which Great Britain and Russia mutually agreed in 1888, "there are limits to that policy . . . we are anxious for the integrity of Persia, but we are anxious far more for the balance of power." Unofficial but weighty opinion pointed out in 1902 that Persia is being rapidly reduced to the position of a Russian vassal state, and that soon probably the St. Petersburg government will control the foreign relations of the shah. While it is unwise, therefore, and indeed hopeless for Great Britain to attempt to wrest from Russia her commercial and political influence in northern Persia, she nevertheless ought strongly to protest against the concession to Russia of a port on the Persian Gulf. Such a concession would mean the necessity of making a similar one to Germany as an outlet for her Bagdad railway, and with these two powers on the coast the British defence of India would have to be greatly strengthened. The Russian view of the matter is expressed by the *Novoe Vremya*, which declared that "southern Persia and the shores of the Persian Gulf are of vital importance to Russia, on account of her aspiration to obtain an opening into the Indian Ocean on the flank of the international highway, which is the Suez Canal. The acquisition of that outlet would have for Russia such vast importance that she cannot make any concession in the Persian question, and it is only on the ground of an agreement regarding that question that it would be possible to establish an understanding between herself and Great Britain."

In the summer of 1902 the Shah Muzafar-ed-din visited Europe, and carried away with him many of the latest inventions of the West, more for his own delectation than for the improvement of his country. He landed at Portsmouth, England, on August 17, reached Paris on the 25th, and on the 17th of the following month was received by the czar at Kursk, whence he departed on the 19th for Persia. His arrival at Resht and his journey thence to Teheran afforded a series of oriental holidays, marked by the usual extremes of splendor and poverty.

PERTH, GEORGE DRUMMOND, fourteenth Earl of. See DRUMMOND, GEORGE.

PERU, a republic on the Pacific coast of South America between Ecuador and Chile. The capital is Lima.

Area, Population, etc.—The area has been estimated at about 695,000 square miles, but there are unsettled boundary disputes with Bolivia, Brazil, and Ecuador, and this figure is probably too large. The population has been estimated at about 4,700,000. Immigration, especially to the lands along the central route from Lima to Iquitos, is encouraged by the government. The Roman Catholic is the only religion having a legal status.

Government.—The executive authority is vested in a president, elected by popular vote, and assisted by a cabinet of six members who hold office at his pleasure. The president in 1902, for the four-year term beginning September 8, 1899, was Señor Eduardo López de Romaña. The legislative power devolves upon a congress of two houses, the senate and the house of representatives. The regular army consists of 375 officers and men; the navy, aside from the *Lima*, a cruiser of 1700 tons, is inconsiderable.

Finance.—The monetary standard is gold, and the unit of value the sol, worth one-tenth of a British sovereign, or 48.665 cents. Revenue is derived chiefly from customs and direct and indirect taxation. In 1900 the revenue was 12,989,828 soles. According to President Romaña's message to the congress (July 28, 1902), the revenue and expenditure in 1901 amounted to 14,988,181 soles and 13,450,420 soles respectively. Estimated revenue and expenditure for 1902 were 15,396,680 soles and 15,767,540 soles respectively; for 1903, 15,396,682 and 15,797,470 soles respectively. In 1890 the government was released from its foreign debt in consideration of extensive concessions to the bondholders, who constitute the Peruvian corporation. The internal debt amounts to about 46,000,000 soles.

Industries and Commerce.—Agriculture and mining are the principal industries. The leading products include sugar, wools, cotton, coffee, silver, and copper. It is estimated that 40 per cent. of the capital of the country is invested in cane sugar plantations; so that the general prosperity of the country varies to a great extent with that of the sugar producer. In 1902, in consequence of the decline in the price of sugar, business conditions in the country were unfavorable as compared with those of the previous year, and in June a commission was appointed to devise measures of relief. Also from a decline in prices the copper industry suffered in 1902, but it was expected that a certain degree of prosperity would be restored by the efforts and ability of Americans, who have established some of the largest plants in Peru.

The general commerce, exclusive of the trade of Iquitos, the eastern river port, has been reported in soles as follows.

	1899	1900	1901
Imports	18,734,949	23,171,506	27,582,239
Exports	30,725,911	44,979,996	42,983,789

The leading imports are cotton and woolen textiles, iron and steel goods, and foodstuffs. Minerals and sugar are the most important exports. The decrease in exports in 1901 was principally in sugar, and to a less extent in borax, coffee, cottonseed, and gold. The mineral export in 1901 was valued at 17,508,485 soles; sugar, 10,300,000; cotton, 3,685,411; wool, 2,780,000; hides and skins, 1,770,000. Nearly half of the foreign trade is with Great Britain; next in order are the United States, Germany, and France.

Tacna and Arica seem destined to remain Chilean territory. In his message of July 28, 1902, President Romoña stated that Chile's disapproval of the Billingshurst-La Torre protocol had not permitted further negotiations; all of Peru's suggestions for settlement of the question, including arbitration, had been rejected by Chile.

PETROGRAPHY. See GEOLOGY (paragraph Petrography).

PETROLEUM. The output of petroleum in 1901 was the largest ever recorded, amounting to 69,389,194 barrels, valued at \$66,417,335, an increase of 5,768,665 barrels or about 9 per cent. over the total for 1900. This increase was due almost entirely to the remarkable development of the Texas and California fields, as the Appalachian States—New York, Ohio, Pennsylvania, and West Virginia—which produce about 80 per cent. of the total, showed a slight falling off, and there was only a small gain in the Lima field. The output was distributed among the principal States, as follows (in barrels): Ohio, 21,648,083; West Virginia, 14,177,126; Pennsylvania, 12,625,378; Indiana, 5,757,086; New York, 1,206,618; California, 8,786,330; and Texas, 4,393,658. The number of new wells drilled in 1901 was 14,250. In the Appalachian field the most important development of the year was the finding of a series of large pools in Monroe and Washington counties, Ohio. The discovery of oil in the Beaumont region of Texas early in 1901, which created a profound sensation in the petroleum trade, has been followed by rapid and substantial development. By the close of the year 138 wells were drilled on Spindle Top, and of this number 55 were active producers, 77 were closed down for want of a market, and the remaining 6 were dry. Some of the wells yielded from 10,000 to 70,000 barrels a day, while their persistent flow showed a reservoir of unusual capacity. The output was limited by the lack of storage and shipping facilities, yet it reached a total of about 5,000,000 barrels—a remarkable record. The physical properties of the Beaumont petroleum are as follows: Specific gravity at 60° F., 0.922 or 21.97° Beaumé; flash point, 170° F.; viscosity, 188 seconds; carbonaceous residue on distillation to dryness, 4.40 per cent.; sulphur, 1.33 per cent.; calorific value, 19,388 British thermal units. Owing to its density the oil is better adapted for fuel purposes than for refining to obtain illuminating and lubricating oils; a large and constantly expanding market has been opened, however, and the future success of the industry seems assured. Among the large consumers are the railroads which have found it to be an ideal fuel for firing locomotive boilers, steamships, and steam plants generally. The location of the field within easy reach of tide-water is a great commercial advantage, affording cheap transportation to the interior of the country, through the Mississippi River, and to the Atlantic Coast States and to Europe. Three pipe-lines have been completed to the gulf, two 19 miles long to Port Arthur and one 24 miles long to Sabine Pass. Oil was found early in 1902 about 20 miles northwest of Beaumont, and other productive wells were opened in Bexar, Brazoria, Caldwell, Concho, Nacogdoches, Robertson, and Young counties. The great extent and productiveness of the oil-bearing territory as revealed by these developments will soon place Texas first on the list of producers in this country.

The California fields more than doubled their output in 1901, a result that was followed by a market depression which reduced the prices of the heavy fuel oils to very low figures. The rapid development of means of transportation, storage, and refining, however, greatly increased the consumption in 1902, and there is little doubt that the enlarging markets will absorb the future production unless it expands at an abnormal rate. The Standard Oil Company completed a pipe-line from the Kern field to San Francisco Bay, where it has erected a large refinery. In San Francisco the oil is now largely used in power plants replacing coal which is imported from British Columbia; it is also used by smelting plants, steamships, and railroads. It is estimated that the railroads alone consumed about 7,000,000 barrels of California petroleum during 1902.

PHILIPPINES, a group of islands lying east of Indo-China, with an area of approximately 143,000 square miles and a population of perhaps 8,000,000. Sovereignty of the Philippines was acquired from Spain by the United States in virtue

of the Treaty of Paris ratified on April 13, 1899. The civil government of the islands has been built up in accordance with (1) the instructions of the President, given under his military authority, on April 7, 1900, to the Philippine commission appointed by him; (2) the Congressional act of March 2, 1901, expressly vesting in the President, for the time being, plenary civil and judicial powers in the Philippines; (3) the Congressional act of July 1, 1902, ratifying and continuing the *de facto* government and its enactments, and providing an organic Philippine law.

Revenue and Expenditures.—The following table shows the revenue and expenditure in the Philippines (except military expenditures) from the date of the American occupation, August 20, 1898, to June 30, 1902:

	Fiscal Year Ended June 30—				Total.
	1899	1900	1901	1902*	
REVENUES.

*The revenues and expenditures are estimated for the year 1902.

†The city of Manila was incorporated by an act of the Philippine Commission of July 31, 1901.

The large surplus of revenues over expenditures has in a large measure been allotted to the payment of various contracts for public improvements, so that the actual cash surplus is comparatively small. All the figures given are in American money, and are computed from the official exchange value of American and Mexican money; that exchange value has been \$2 in Mexican for \$1 in United States currency up to January 1, 1902; \$2.10 in Mexican for \$1 in United States through March, 1902, and \$2.27 Mexican for \$1 in United States through June, 1902. The insular treasury lost, in 1902, owing to the shrinking value of silver, a sum of over \$1,000,000.

Agriculture.—Both natural contingencies and conditions of trade and currency prevented any substantial beginning from being made in 1902 in developing the great agricultural wealth of the Philippines. The prohibition imposed by the Congressional act of July 1, 1902, against any one corporation in owning more than 2500 acres of land, not only prevented the investment of capital in such industries as tobacco and sugar culture, but also deterred investments of capital in railroad enterprises, and discouraged existing landholders from increasing their crops in the hope of better transportation facilities. Again, the fluctuating standard of value caused by the Mexican dollar crippled agriculture as well as other industries, and finally the lack of adequate and efficient labor was felt everywhere. But beyond these general trade drawbacks was the loss, principally through the rinderpest, of 90 per cent. of the carabo or water-buffalo, upon which the cultivation of rice, sugar, and hemp was largely dependent. At the same time the rice crops in China and Saigon suffered from the drought, and the price of rice in the Philippines rose from \$4 to \$7 Mexican per picul (137.9 lbs.). Moreover, while rice was being imported at these high prices, cholera swept over the land, causing, it was estimated, 100,000 deaths. The hard conditions, however, did not apply to the provinces where, as in Albay, hemp was the principal product, or in the northern provinces of Luzon, which depend largely upon the crops of corn and tobacco. See AGRICULTURE (paragraphs Agriculture in the Philippines and Agricultural Experiment Stations).

Forest Lands.—The forest area of the Philippines, including public and private woodlands, was estimated in 1890 at 48,112,920 acres. Far less than 1,000,000 acres are under private control. There are fourteen sawmills in the Philippine Islands using steam or water power, eight of which are in Manila and six in the provinces. The Manila mills have a total daily capacity of 3660 cubic feet. There were taken from the public lands in the Philippines during the fiscal year ending June 30, 1902, 3,637,392 cubic feet of timber; 3,808,870 cubic feet of fire-wood; 247,947 cubic feet of

charcoal; 20,685 pounds of rattan; 2,256,458 pounds of dye-woods; 312,154 pounds of tan bark; 1,082,235 pounds of gum mastic; 282,996 pounds of rubber (superior grade); 373,331 pounds of gutta percha (low grade); 9181 gallons of vegetable oils; 113,905 pounds of pitch; and 20,685 pounds of cinnamon. The total revenue derived from these products was \$348,073.08 (Mexican); government charges on timber were a little more than 6 cents (Mexican) per cubic foot, which was between 5 and 10 per cent. of the market price of the timber at Manila. See FORESTRY (paragraph Forestry in the Philippines).

Commerce.—The commerce of the Philippine Islands with the United States expanded rapidly during 1902, in spite of many adverse conditions, especially the unstable currency. The total imports (exclusive of army supplies) from the United States were \$4,728,555, as against \$4,158,699 in 1901; the total exports to the United States were \$10,211,303, as against only \$3,737,071 in 1901. The following table gives the principal imports of domestic merchandise from the United States to the Philippines for 1901 and 1902:

IMPORTS INTO THE PHILIPPINES FROM THE UNITED STATES.

ARTICLES.	Value.	
	1901	1902
Breadstuffs.....	\$276,031	\$375,729
Cotton, manufactures of.....	113,753	377,586

Spirits, wines and malt liquors.....	874,255	641,784
Wood, and manufactures of.....	260,941	269,202
Total.....	\$2,575,433	\$2,994,923
All others.....	1,583,266	1,783,632
Grand total.....	\$4,158,699	\$4,728,555

Unmanufactured Manila hemp fiber constitutes the only important export to the United States, amounting in 1902 to 50,361 tons, valued at \$10,003,954, as against only 23,948 tons, valued at \$3,478,580, in 1901—an increase of nearly 200 per cent. in value of the trade. This item made up more than 99 per cent. of the exports to the United States in 1902. While the trade in articles free of duty expanded greatly during 1902, the trade in dutiable merchandise fell off from \$233,293 in 1901 to only \$170,167. Sugar was the most important single item among commodities subject to duty, amounting to 5,440,000 pounds, valued at \$73,277, in 1902, as against 11,424,000 pounds, valued at \$188,159, in 1901, a decrease of over 61 per cent. Of the total commerce between the United States and the Philippines, American vessels carried imports into the islands amounting to only \$741,957 and exports amounting to only \$135,190, as against \$3,849,408 and \$10,021,651, respectively, carried in foreign ships. Judging from the peculiarities in the growth in the exports of free commodities and the decline in exports of dutiable commodities, it is evident that what the islands need more than anything else is a greater measure of free trade. With this must be coupled the establishment of a stable and usable currency if commercial conditions in the Philippines are to be made at all tolerable.

No figures were available relating to the trade of the Philippines with foreign countries during 1902. The following table gives the official figures of the foreign trade, as published by the War Department, for 1900 and 1901:

COUNTRIES.	1900		1901	
	Imports.	Exports.	Imports.	Exports.
France.....	\$978,095	\$2,533,607	\$1,907,074	\$1,323,513
Germany.....	1,631,816	126,729	2,205,695	81,432
Spain.....	1,989,235	1,566,972	1,934,281	1,263,150
United Kingdom.....	5,576,931	8,106,220	5,692,579	11,126,226
Chinese Empire.....	3,127,569	238,827	3,584,966	118,003
British India.....	1,745,124	1,009,368	3,384,065	728,163
French India.....	760,064	596	2,359,039	1,622
Kongkong.....	4,610,913	3,870,994	1,165,738	2,924,974
Japan.....	441,319	794,453	1,061,131	1,584,218
Total.....	\$20,631,086	\$18,246,586	\$23,594,538	\$19,151,301
All others.....	\$1,879,493	1,778,646	3,033,072	800,203
Grand total.....	\$22,710,581	\$20,025,232	\$26,627,610	\$19,951,504

Banks.—According to the report of the treasurer of the Philippine archipelago for the year ending June 30, 1902, there were eleven banks, including branches,

operating in the islands, with a total capital of \$1,400,086. The deposits amounted to \$18,122,866, and the total resources to \$29,914,489. The cash holdings were as follows: United States gold, \$407,825; other gold coin, including bullion, \$22,886; United States silver dollars, \$38,680; United States fractional silver and other money not classified, \$73,027; United States notes, \$1,390,112; Mexican pesos, \$4,364,066; Spanish-Filipino pesos and half pesos, \$1,531,106; and other Mexican and Spanish-Filipino currency, \$84,251. The larger part of the banking of the islands is conducted by the Hongkong and Shanghai Banking Corporation, the chartered Bank of India, Australia, and China, and the Spanish-Filipino Bank. Since 1901 the following banking corporations have engaged in business in the islands: The North American and Philippine Loan and Trust Company, the American Bank of Manila, the International Banking Corporation, and the Guarantee Trust Company of New York.

Public Works and Improvements.—The bureau of coast guard and transportation contracted for ten vessels, five of which were completed during 1902, for use in the service of the bureau. It is estimated that \$200,000 will be needed to complete the construction of lighthouses. The commission has not yet passed a general railroad law or a general corporation law, but a law was passed in 1902 for granting franchises for electric street railways in the city of Manila, inviting competitive bids upon three points: The duration of the franchises, the fare to be charged, and the percentage of gross receipts to be paid for the franchises. Bids were advertised for in Manila, New York, Washington, and Chicago.

Report of the Commission.—On November 1, 1902, the Philippine commission submitted its report for the year ending October 1, 1902. It urged the following recommendations: "(1) The establishment of a gold standard in these islands, upon the plan recommended by the commission in its report of last year, and of banking corporations empowered to issue circulating bank notes under proper safeguards; (2) a reduction of at least 75 per cent. of the Dingley rates of duties upon goods imported from the United States to the Philippine Islands; (3) an amendment to the Philippine act, so that the limit upon lands which may be sold to or held by individuals or corporations from the public domain shall be increased from 1024 hectares (2530.304 acres) to 25,000 acres, or in the alternative, so that the government shall be given the power to lease for sixty years upon competitive bidding tracts from the public land aggregating in any individual or corporate lessee not more than 30,000 acres; (4) that the Philippine act be amended by repealing the limitation which forbids an individual or corporation from holding an interest in more than one mining claim; (5) that all bonds issued by the insular government under the authority of the Philippine act shall be free from State, county, and municipal taxation in the United States; (6) that an amendment be made to the Chinese exclusion act, giving power to the government by law to admit a fixed and limited number of Chinamen into the Philippine Islands, who are certified to be skilled laborers, on the bond of the employer that for every Chinese skilled laborer employed, he will employ a Filipino apprentice, and that he will return the Chinese skilled laborer thus introduced within five years after his admission to the country, and that he shall pay a head tax not exceeding \$50 for each Chinaman so admitted, to the insular government, to meet the expenses incident to the enforcement of these restrictions."

Education.—The difficulties confronting the Philippine government in the matter of public education are threefold, namely: the differences in the races, the lack of transportation, and the inhibiting influence of religious orders and affiliations. In view of the great difficulties in the way, great progress has been made since the establishment of civil government on July 1, 1901. Seventeen school divisions have been established, comprising an area of 114,792 square miles. The total number of public schools in the archipelago on September 30, 1902, was 1835, employing 2623 native teachers and 783 American teachers. The number of children enrolled in day schools was more than 200,000, and the enrolment in night schools exceeded 25,000. The expenditures from July 1, 1901, to February 1, 1902, were: Salaries and wages, \$450,889; furniture, books, etc., \$92,363; transportation, \$43,853; support of provincial schools, \$1857; miscellaneous contingent expenses, \$26,370, making a total of \$615,333. The report of the normal school in Manila on January 1, 1902, showed a total enrolment of about 350, with an average daily attendance of about 202. In the nautical school at Manila the total enrolment was 83, and the average daily attendance was 83. The trade school at Manila showed a total enrolment of 148. An agricultural school was established at Negros. The teachers employed in these four special schools number four, thirteen, five, and one, respectively. Industrial education is the great want among the Filipinos, and it is the aim of the government to supply the necessary training to make the people self-supporting and intelligent workmen. Grammar and high schools are being established as rapidly as the need demands, and a school of fine arts, music and painting, a technical school, and a university are definitely planned.

Monastic Orders.—The friars of various orders hold much of the agricultural and other lands of the islands. In 1902 the valuation of their real estate in Manila alone was 5,901,978 Mexican dollars. In view of the intense hostility of the people toward the friars, and the necessity of throwing open their lands for settlement and cultivation, the Philippine commission decided that the only feasible settlement would be to purchase their lands and persuade them to leave the islands. But this solution must depend entirely upon the voluntary cooperation of the friars, as no warrant for compelling them to dispose of their lands or to emigrate can be found in Anglo-Saxon jurisprudence, quite apart from the protection afforded by the Treaty of Paris. Upon the recommendation of the commission, a clause was inserted in the Philippine civil government bill (see paragraph Temporary Government), and became law on July 1, 1902, authorizing the Philippine government to issue bonds for the purchase of lands held in such large tracts or in such a manner, "as in the opinion of the commission injuriously to affect the peace and welfare of the people of the Philippine Islands." Governor William H. Taft was instructed by the secretary of war on May 9, to go to Rome, and enter into negotiations with the Holy See for the sale of the friars' lands and the withdrawal of the friars from the islands. The proposals were: (1) The Philippine government would buy all the agricultural lands to which the orders held title either by themselves, by contract, or by a majority of company stock; the price to be determined by an arbitration tribunal of five, of whom the President should appoint two, the Holy See two, and a disinterested person one; (2) the Philippine government would make over to the representatives of the Holy See the land and inclosures, formerly held by Spain, occupied by Catholic churches and convents; (3) the Philippine government and the Holy See would endeavor to reach an agreement as to which of the various established educational and charitable trusts should be administered by each of them; and failing to agree, the subject would be referred to the arbitration tribunal appointed; (4) subject to the favorable action of Congress, the United States government would pay such compensation as the arbitration tribunal determined was due for churches and convents occupied and injured by American troops during the insurrection. On its side the Holy See should undertake that all friars except those outside of Manila, should withdraw from the islands within two years, and only secular priests or non-Spanish members of religious orders, whose presence would not disturb peace or order, should hereafter be appointed as parish priests. To these proposals, the Holy See, through Cardinal Rampolla, agreed in substance, except as to the immediate withdrawal of the friars. In that matter he stated that their violent recall "would be contrary to the positive rights guaranteed by the Treaty of Paris," and would place him "in conflict with Spain, who would have every reason to protest." The government then arranged to treat with the new apostolic delegate to the Philippines for a settlement, and the plan of buying the friars' land piecemeal instead of *en bloc* was adopted. The Holy See assented to this and promised to do everything possible "to ameliorate the religious situation of the archipelago and to cooperate in the pacification of the people under the American sovereignty." Negotiations between Governor Taft and the apostolic delegate, Archbishop Guidi, were begun at Manila November 28, but at the end of 1902 no conclusion had been reached.

Temporary Government.—A congressional measure of great importance was an act of July 1, 1902, for the temporary government of the Philippines. A bill for this purpose passed the House in April. It provided for a gold monetary standard and for a popularly elected legislative assembly to be *immediately* called into existence with the Philippine Commission as the upper chamber. After seven weeks of debate the Senate by a vote of 48 to 30 passed the bill so amended as to provide for a legislative assembly only after the taking of a census and after a condition of general peace and good order should have prevailed for two years. Furthermore, the bill provided for the silver standard in the islands. After consideration of the bill in conference a compromise was reached, omitting all reference to a monetary standard. By the act as finally passed the existing government of the Philippines was continued, as instituted under the executive orders of the President. These orders comprised that of April 7, 1900, creating the Philippine Commission and defining its powers; that of June 21, 1901, creating the offices of governor and vice-governor; and an act of the Philippine Commission of September 6, 1901, organizing the departments of the interior, of commerce and police, of finance and justice, and of public instruction. All inhabitants of the Philippines, citizens of Spain at the date of the ratification of the treaty with Spain, April 11, 1899, were declared to be citizens of the Philippine Islands, if they so elected, "and as such entitled to the protection of the United States." The Bill of Rights, the federal constitution, was virtually enacted for the Philippines, except as to the right of maintaining a militia and of trial by jury. The President was directed, when the insurrection should have changed to "general and complete peace," to order a com-

plete census of the islands, including statistics of population, race, illiteracy, dialect, and social conditions.

Legislative and Judicial Power.—It was directed that "two years after the completion and publication" of the census, if general peace still continued, the legislative power of all those parts of the islands "not inhabited by Moros or other non-Christian tribes" should be transferred from the Philippine commission to a bicameral legislature, consisting of the Philippine Commission and the Philippine Assembly. The assembly is to consist of from fifty to one hundred popularly elected delegates, apportioned among the provinces in accordance with population, but each province shall have at least one. The electors of these delegates are to possess the same qualifications as already required by the Philippine Commission in municipal elections; that is, they must have held office under the Spanish régime, or own property to a value of \$250, or pay taxes of \$15 or over, or speak, read, and write Spanish or English. Two resident commissioners to the United States are to be elected by the legislature, and both commissioners and delegates are to be elected biennially. The legislature is to meet annually; but if at any session the legislature refuses to vote supplies to the government, the executive may nevertheless disburse sums equal to the amount last appropriated. The Supreme Court, the courts of first instance, and the municipal courts, as established by an order of the Philippine Commission, June 11, 1901, are continued. The United States Supreme Court is given appellate jurisdiction over all judgments of the Insular Supreme Court, whenever the cause in controversy exceeds a value of \$25,000, or whenever the constitution, the laws, or any right or title of the United States are involved.

Public Lands.—All property and rights acquired by the United States in the Philippines through the treaty with Spain, except such lands as may be especially reserved by the President for federal uses, are placed under the control of the Philippine government for the use and benefit of its people. The insular government is directed to classify the public agricultural lands and make general regulations, subject to the approval of the President and of Congress for their lease or sale. The government is also authorized to grant free title to public lands, not exceeding 16 hectares, to any native occupying them previous to August 13, 1898, and to issue general regulations for the sale of public lands—except timber and mineral lands—to settlers and cultivators; but the lands so disposed of must be actually occupied and improved for at least five years, and in any case holdings are limited for individuals to 16 hectares (39.536 acres); for corporations to 1024 hectares (2530.304 acres). See paragraph Monastic Orders.

Bonds for Improvements.—With the approval of the President and of Congress, the government is authorized to permit municipalities to issue, at not less than par, 5 per cent. bonds for municipal improvements. Such bonds are to be payable in five and redeemable in thirty years; they are not to exceed in amount 5 per cent. of the assessed valuation, and they are to be met, as to both principal and interest, by local taxation. Under the same conditions of approval, issue, and redemption, the city of Manila is empowered to issue bonds to the amount of \$4,000,000 for the purpose of obtaining an adequate drainage system and water supply.

Franchises.—The insular government is empowered to "grant franchises, privileges, and concessions, including the authority to exercise the right of eminent domain," but only upon the following conditions: That all franchises and concessions shall be subject to amendment or revocation by Congress; that stocks and bonds shall be issued only to an amount representing actual cash received, or property at a fair valuation; and that in the case of public-service corporations, the charges made are to be officially regulated, the corporations' accounts examined, and a reasonable percentage of the companies' gross earnings paid into the insular treasury, or into the treasury of the province or municipality within which the franchise is granted and exercised. Corporations are not to be authorized to do a real-estate business, or to hold any other property than that necessary to the purposes for which they are incorporated. It shall be unlawful for any agricultural or mining corporation, or any member thereof, to be interested in any other agricultural or mining corporation. Corporations may lend money upon real estate and may buy in property when necessary to the security of their loans; but property so purchased shall be sold within five years. Corporations not organized in the Philippines but doing business therein shall be bound by all these provisions so far as they are applicable.

Coinage.—The insular government is authorized to establish a mint at Manila, and to coin there, or to have coined in the United States through the secretary of the treasury, subsidiary and minor coins. The minor coins are to be legal tender for \$1 and the subsidiary coins for \$10, and the unit of both is to be the "centavo," roughly equivalent to a half cent (American). The minor coins are to be of the denominations of one-half centavo, one centavo, and five centavos, and the subsidiary coins of the denominations of ten, twenty, and fifty centavos. The sub-

sidary coins are to be silver nine-tenths pure, and to have a gross weight respectively of 38.58 grains, 77.16 grains, and 192.9 grains. The Filipino dollar and the subsidiary currency issued by the Spanish government may be recoined into the new subsidiary issue, and on all moneys circulating in the islands, the governor is authorized, as often as every ten days, to establish the equivalent rates of exchange with the money of the United States. The coins provided for in this act were not issued by the commission, as such coins would only increase the number of standards without giving the islands a stable and single standard. In fact, the only part of this section which was of any benefit was that permitting the commission to establish the rates between silver and gold every ten days instead of every three months as before. The act settled nothing as to the currency, and the question must undoubtedly be brought again before Congress.

Mineral Lands.—All valuable public mineral lands are declared to be open to exploration, occupation, and purchase by citizens of the United States or of the Philippine Islands, subject to the regulations imposed. But nothing in the regulations is to be construed as operating adversely to claims and holdings acquired under previously existing laws. Mining claims upon land containing valuable deposits may be made to the extent of 1,000,000 square feet (22.957 acres) each; the claims to be as nearly as possible in rectangular form. But no person or corporation shall hold in his or its own or in another name more than one mineral claim on the same vein or lode, and a claim to hold valid must be worked to the amount of \$100 worth of labor in each year. Patents are to be issued for claims upon proof that \$500 worth of labor has been expended thereon and upon payment to the treasury of \$5 per acre. Placer claims, claims for building-stone lands, and oil lands, shall be entitled to patents, in absence of adverse claims, when they have been held and worked for ten years; but the patents are to be limited to 8 hectares (19.768 acres) to an individual, and 64 hectares (158.144 acres) to a corporation. Entries upon coal lands shall be conditioned upon paying to the government not less than \$25 per hectare, if the lands are over 15 miles distant from a railroad or navigable water, and not less than \$50 per hectare if they are within that distance. The entry cannot exceed 64 hectares (158.144 acres) by an individual or 128 hectares (316.288 acres) by a corporation.

Congressional Jurisdiction.—It is provided that hereafter, the governor, vice-governor, members of the Philippine Commission, heads of executive departments, and the chief justice and associate justices of the Insular Supreme Court, shall be appointed by the President with the consent of the Senate. Congress reserves the power to annul all laws passed by the government of the Philippines and the Philippine Commission is directed to make annual reports of all its receipts and expenditures to the secretary of war. The division of insular affairs, instituted by the War Department, is continued as the bureau of insular affairs, and to the bureau is committed "all matters pertaining to civil government in the island possessions of the United States subject to the jurisdiction of the War Department."

History.—The chief work of the military forces in the Philippines during 1902 was the suppression of the insurrection in the island of Samar and in Luzon. An incident of the operations was the capture of Lukban and Malvar, the sole remaining Filipino chiefs of prominence. This had the effect of putting an end to rebellious agitation in these provinces. In the spring an insurrection of Moros on the island of Mindanao broke out and was not completely suppressed until near the end of the year. After several defeats the sultan urged his followers to accept the friendship of the Americans, but a majority of them refused. Thenceforth the campaign consisted of skirmishes against the rebels. In August General Chaffee went to Mindanao to direct the campaign in person. In the meantime the sultan was captured, and in October Captain Pershing inflicted a crushing defeat upon the insurgents, killing or wounding about 100 of them and destroying forty of their forts. In connection with the military operations charges of cruelty to the natives were made against several officers of the army. The most notable of these cases was that of Gen. Jacob H. Smith commanding the troops in Samar, who ordered his troops to kill all natives over ten years of age capable of bearing arms, and to "make Samar a howling wilderness." When the news of this order reached the United States it provoked great indignation and was the subject of general condemnation. In April General Smith was tried by a court-martial sitting at Manila, and found guilty of "conduct to the prejudice of good order and military discipline." The findings of the court were approved by President Roosevelt, and General Smith was retired from active service. Another case which attracted much attention was the trial by court-martial of Major Waller upon the charge of cruelty in executing eleven natives of Samar. He was acquitted on the ground that the circumstances justified the execution of the insurgents. Several other trials upon similar charges took place, but the officers were acquitted. Upon review by the President the findings in several instances were disapproved and the officers were

duly punished. Outside the provinces mentioned peace and order prevailed. On May 23 Acting-Governor Wright cabled the War Department that no further reason existed why civil government should not be established in all the Philippine islands outside the Moro country. At the time of the dispatch no civil government existed in the provinces of Lepanto, Bontoc, Batangas, Laguna, Principe, Infanta, Mindoro, Samar, and the Paragan and other small groups, although no insurrection existed at the time in any of these provinces. Acting upon this information the President, on July 4, issued a proclamation of amnesty declaring the Philippine insurrection at an end everywhere except in the Moro territory, and extending a full pardon and amnesty to all persons, with a few exceptions, in the archipelago who had in any way resisted the authority of the United States. The excepted classes included those who, since May 1, 1902, had committed crimes in any province in which civil government had been established, and those convicted of the crimes of murder, rape, arson, or robbery by any military or civil tribunal organized under the authority of Spain or the United States. As a result of the proclamation some 1800 Filipinos were released from imprisonment. By a separate proclamation issued through the War Department at the same time General Chaffee was relieved of his civil duties as military governor, his authority in civil matters being superseded by that of the Philippine Commission. As a further proof of the improved conditions in the islands the strength of the army in the Philippines was reduced from 31,700 men to about 23,000. Orders were also given for the return of the Eighth, Fifteenth, Twenty-fourth, and Twenty-fifth regiments of infantry and a squadron of the Tenth cavalry, after which it was expected that the number of American troops in the Philippines would not exceed 18,000 men, as against 70,000 on June 20, 1901. On June 19 the secretary of war sent to the Senate a statement of the expenditures in the Philippines from the beginning of the American occupation as follows: 1898 (two months, May and June), \$3,686,850.81; 1899, \$26,230,673.10; 1900, \$50,869,543.96; 1901, \$55,567,422.86; 1902 (ten months, July to April inclusive), \$34,972,082—total, \$171,326,572.73. An important act of Congress affecting the Philippines was a temporary measure to provide revenue for the government of the islands. A bill to confirm the tariff duties already levied by the Philippine Commission, but providing that imports from the Philippines should pay the same duties in the United States as imports from foreign countries, and that exports from the United States should be exempt from internal revenue taxes and subject only to the customs duties in the Philippines, and that all such duties should be expended in the islands alone passed the House December 18, 1901, by a vote of 163 to 128. It was amended by the Senate so as to reduce the tariff rates on importations from the Philippines by 25 per cent. and by deducting as well the amount of the export duty levied in the islands. After some delay the House accepted the amendments, and the bill became law March 4.

During the latter part of the year the financial condition of the islands was unfavorable chiefly on account of the fall in the price of silver. At the same time considerable distress, amounting to famine in some localities, existed throughout the islands, resulting from crop failures. The government was forced to adopt measures to relieve the suffering and improve the financial situation.

The annual report of General Chaffee on conditions in the Philippines was made public November 14. He reviewed the work of the army in suppressing recent insurrections, and declared that nothing was done in Samar which was not justified by the conditions there existing. With regard to the Moros in Mindanao, who at that time were the sole remaining insurrectionary element, he said that it would require patience, time, and tact to establish the authority of the United States over them. He recommended that the title of the Sultan of Jolo as owner of the lands of the Jolo archipelago be quieted by a money consideration, and that his presence be removed, after which the laws could be enforced through the chieftains upon their followers. On this point he said: "It will be impossible for many years to ignore chieftainships—*dattos*—and to deal directly with the individual Moros as is done with civilized Christian people. It will, however, be a long step ahead for the inhabitants of the Jolo archipelago when the *dattos* are independent of the sultan and recognize the United States as the only sovereignty to whom allegiance is due and as the only authority empowered to enact laws for the government of the inhabitants and the country; that all the inhabitants are equal before the law; that Christian people have a right to live."

Territorial Officers.—For 1902: Civil governor, William H. Taft (Ohio); civil vice-governor and secretary of commerce and police, Luke E. Wright (Tennessee); secretary of finance and justice, Henry C. Ide (Vermont); secretary of public instruction, James F. Smith (California), successor of Prof. Bernard G. Moses (California); secretary of the interior, Dean C. Worcester (Michigan); attorney-general, L. R. Wilfley (Missouri).

Supreme Court: Chief justice, Cayetano Arellano (Philippine Islands); asso-

ciate justices, J. F. Cooper (Texas), Fletcher Ladd (New Hampshire), Victorino Mapa (Philippine Islands), Florentino Torres (Philippine Islands), and Charles A. Willard (Vermont).

PHOSPHATE. See MINERAL PRODUCTION.

PHOTOTHERAPY. The ultra violet rays of Finsen have been extensively used during 1902, in many and widely diverse conditions. The most brilliant results were obtained in lupus, although epithelioma, rodent ulcer, and various chronic skin diseases, and infections were treated with some success. The actinic rays have been found to have a distinct antiseptic effect and to produce a considerable degree of anæsthesia. One observer reports the removal of a large sebaceous cyst of the scalp under actinic ray anæsthesia; an abscess opened under the same conditions and treated with blue light antiseptis; and the removal and after treatment in the same manner of a sloughing piece of skin an inch square from the palm of the hand. The only drawbacks to treatment by the Finsen method are the enormous cost of the apparatus and the length of time necessary to effect a cure. Colquhoun describes a simpler form of apparatus. The patient sits with his back to the window, and sunlight is reflected from a mirror and focussed through a biconvex lens. Between the patient and the lens is a bottle containing an aqueous solution of ammonio-sulphate of copper, which absorbs the heat rays and gives a concentrated beam of blue light. Good results were obtained in lupus by an hour's daily treatment. This apparatus is limited by being absolutely dependent on sunshine. Several other modifications of the Finsen apparatus have been devised by different investigators, but thus far none has proved sufficiently perfect to replace it. In Russia the light treatment has been most thoroughly studied during 1902. Veliaminoff relates the results of 55 experiments. Of these 38 were of lupus vulgaris, 19 of erythematous lupus, 10 of rodent ulcer, and 10 of telangiectasia. In these experiments attention was directed toward the solution of the problems as to the effect of luminiferous energy on bacteria, and on healthy and diseased animal tissue. One of the collaborators, V. N. Tomaschenski, performed about 500 ingenious experiments with 10 species of bacteria, including a number of pathogenic and spore-forming varieties (staphylococci, bacillus pyocyaneus, bacillus typhosus, etc.) and found that light acts destructively on bacteria (which is already well known) and that the bactericidal action resides almost exclusively in the shortest light waves. The amount of luminiferous energy necessary to destroy bacteria was found to be 1 to 30 kilogrammetres for each square centimetre and infected surface, according to the nature of the organism. This destructive action of the shorter waves holds good in the case of the lower plant and animal microorganisms, such as spirogyra, amœba, flagellata, infusoria, etc. It was found that light possesses a destructive action on the lower organisms and some of the cell elements, causing at the same time proliferation of fibrous connective tissue. The therapeutic effect of Finsen's light depends on this double action. In comparing the effects of the actinic light days with the Röntgen rays it is noted that the latter cannot take the place of the actinic rays, although they may prove a useful adjunct. The reaction of the X-rays is, as a rule, more severe than that caused by the ultraviolet rays, and is deeper, more painful, and often suppurative. Effects are slow in appearing, but the action is cumulative, its effects endure longer, and action goes on after treatment has ceased. See RÖNTGEN RAYS.

PHYSICS. *Radioactivity.*—On the experimental side of physics the year 1902 was most productive in results relating to the related phenomena of radioactivity and the discharge of electricity through gases. Curie, the discoverer of radium, has prepared a much purer sample of it than had before existed, and has made, by weighing the chloride and then determining the amount of chlorine present by precipitation with silver, a new determination of its atomic weight, which he gives as 225, with an error not greater than one unit. It has been shown that radiations from radium cause liquid dielectrics, such as oils, to become slightly conducting to electric currents, just as happens in the case of gases, though in liquids the effect is not so great. Tommasina describes experiments which prove that part of the radium radiations may undergo reflection from a metal surface. It had been concluded, from some experiments of Becquerel, that the shower of particles thrown off by radium, constituting the most important part of the radiations, involve so small an amount of matter that the loss of weight would be absolutely incapable of detection by any balance. On the contrary, a concentrated sample of a radium preparation sealed inside a glass tube, lost 1 mg. in weight in thirty days. The radium preparations are found to give a greenish to carmine red color to the Bunsen flame. A certain small part of the radiations from radium, uranium, and thorium is found to be very penetrating, losing only half the intensity after passing through 1.5 cm. of lead. This radiation is not deflected by a magnetic field. As it is known that radioactive matter is very widely distributed, it has been suggested that the so-called spontaneous ionization of air that takes place even in tightly closed vessels

may be due simply to such penetrating radiations. A number of new radioactive preparations have been prepared, which differ in some respects from former preparations. The nature of these is little understood, though it is probable that they are simply new manifestations of the known radioactive elements.

Researches on the radioactive matter in the atmosphere, which may be collected and concentrated on a negatively charged conductor, have been continued. Professors Elster and Geitel have shown that the air in cellars contains much more of the radioactive substance than the open atmosphere, though the dampness of the cellar is certainly not the cause of this. Air drawn up from the ground through a pipe driven a metre into the earth is strongly radioactive, so that it is probable that the effect in cellars is due to the ground air diffusing through the walls. Prof. J. J. Thomson has found that air attains radioactive properties by being bubbled through water or having water sprayed into it. Freshly fallen rain evaporated to dryness leaves the vessel radioactive. Neither the magnitude of the rain drops, time of day, time since beginning of shower, nor kind of vessel exerts any influence on the amount of radioactivity. The intensity of the activity rapidly decreases, falling to about one-quarter its value in an hour. Freshly fallen snow also shows this radioactivity. At the foot of Niagara the air contains no radioactive matter, doubtless because it is kept so thoroughly washed by the spray. Since negatively charged conductors collect radioactive matter from the atmosphere, it has been pointed out that all objects on the surface of the earth must have on their surface a certain amount of radioactive matter, for the earth is generally negatively charged with respect to the atmosphere.

Professor Rutherford and others at McGill University have made very extensive studies of thorium in reference to its radioactivity and have arrived at the following conclusions: About 54 per cent. of the activity of thorium compounds is due to a non-thorium type of matter, called ThX, possessing distinct chemical properties, which is temporarily radioactive, its activity falling to half value in about four days. The new material is produced continually by thorium, seemingly independently of its chemical or physical environment. ThX excites radioactivity in surrounding bodies by means of an emanation which it in turn produces, which emanation diffuses itself much like a gas. Thorium can be temporarily freed by chemical means from both ThX and the emanation. Radioactivity is due to a change within the atoms and is probably an accompaniment of a chemical change. This being the case we have in radioactive phenomena a means of studying chemical changes which are far too small in amount to be revealed to even the most refined spectroscopic analysis.

Electronic Theory.—In theoretical physics much has been done towards developing the electronic theory, which has as its basis the idea of a small particle, a constituent of the atom, which is invariably connected with a definite electrostatic charge, and which is termed an electron. In the shower of charged particles constituting the cathode or Becquerel rays we have these electrons in their most comprehensible conditions. The electronic theory seeks to explain all electrical phenomena, so far as connected with ordinary matter, by means of a mechanics established on the actions of the electron under electrostatic and electromagnetic strains in the ether. Such a theory, to be complete, must also account for the conduction of heat, the radiation of heat and light, and all the phenomena of reflection, refraction, absorption, polarization, etc., of light. Most of the eminent theoretical physicists have contributed something to this theory during the year, among whom are Rayleigh, Kelvin, Thomson, Lodge, Heaviside, Crookes, Lorenz, Drude, Planck, Stark, Riecke, Abraham, and Kaufmann. This theory is no doubt destined to bridge over many of the gaps between electricity and mechanics. One of its most interesting developments experimentally was the measurements of Kaufmann on the deflection of the Becquerel ray electrons in the electrostatic and electro-magnetic fields, which he claims show that the apparent mass of the electron is due entirely to the magnetic field it sets up in the ether when it is in motion, which brings up afresh the not improbably correct hypothesis that all inertia is electromagnetic.

Static Converter.—Mr. Peter Cooper Hewitt has continued his investigations of the mercury vapor electric lamp, which has an efficiency as high as three candle power per watt, but which has been of little practical value on account of the peculiar color of its light; and by introducing small amounts of other substances into the mercury has succeeded in improving the color to some extent. Having turned his attention to another property of the mercury vapor tube, he has applied it with success to the rectification of alternating currents. A glass bulb contains mercury vapor under reduced pressure, a liquid mercury cathode, and an iron anode. This bulb then acts as a valve, allowing the current to pass in one direction but completely preventing its passage in the other direction. A comparatively high voltage, such as that from a spark coil, is required to start the current, but once started it can be maintained by 100 volts or under. If an alternating current is supplied to it only half the wave

can pass through, and, the current ceasing entirely during the other half, it would require restarting with a spark at every alternation. To obviate this the inventor has adopted the very ingenious device of using four anodes, one for the original starting spark, the other three for connection to the leads of a three phase circuit. Since the current from at least one of the leads is going in the right direction at any moment, the conductivity of the vapor column does not break down, and the result is a pulsating direct current in the circuit. The efficiency of this so called static transformer may be made 99 per cent., and one to rectify enough current from 200 16 candle-power lamps is only slightly larger than an ordinary 100 candle-power lamp. The drop of potential across the converter remains at about 14 volts, no matter what the current may be. An immediate application is in storage battery charging from an alternating circuit, for it is known that a pulsating current is better than a steady one in battery charging.

Electrolytic Rectifier.—From an investigation of the phenomena of the aluminium rectifiers R. E. Guthe discards the idea of a film of oxide causing the high resistance for currents from the liquid to the electrode. If such a film were the true cause the resistance would vary widely with the size of the plate; besides, the sudden breaking down on sending a current in the opposite direction would hardly be explainable. He then from several considerations shows that the resistance is actually due to a thin film of gas, probably oxygen. Only in places where the accidental concentration of energy is too great do any ions break through, which accounts for the small permanent current, as is confirmed by the fact that heat increases the current while the concentration of the solution does not affect it.

Convection Currents.—The question of convection currents, or the equivalence in magnetic effect of a succession of statically charged bodies in rapid motion to a conductor carrying a current, having been raised by experiments of Cremieu which apparently disproved the equivalence, has been much discussed on account of the important part it plays in electromagnetic theory. Experiments made by Mr. H. Pender and Professor R. W. Wood at the Johns Hopkins University have fully sustained the belief that convection currents are equivalent magnetically to conduction currents. Mr. Pender rotated a set of charged discs near a suspended magnet and obtained deflections of the magnet equal in sign and amount to those to be expected from theory. Professor Wood used the very ingenious method of propelling a stream of charged particles of solid carbon dioxide from a jet of the gas escaping from under high pressure, through a glass tube near a suspended needle. The particles become charged as they are formed in the jet and their velocity may be made several thousand feet per second, enormously greater than any to be obtained with a rotating disc. The deflections of the magnet were reversed in direction when the direction of the stream of particles was reversed, and in amount they corresponded to what was expected. Thus at his own university the results of the late Professor Rowland have been amply confirmed by two of his former pupils.

Atmospheric Electricity.—A conference on atmospheric electricity was held at Göttingen May 15 and 16, which brought together a large amount of new material for the study of the subject. Reports were read from the recently established stations of the Vienna Academy at Trieste, Vienna, Kremsmunster, and on the Sonnblick. Mechanically self-registering instruments for measuring atmospheric potential and conductivity are in use at these stations. Professors Elster and Geitel have much improved their portable apparatus for measuring atmospheric potentials and dissipation. It consists now of a special form of leaf electrometer with amber insulation, the air in the case being kept dry by a bit of metallic sodium, used in connection with a dry pile of several thousand elements.

Magnetic Alloys.—An important research on the conductivity and magnetic properties of iron alloys has been made by Prof. W. F. Barrett and Mr. W. Brown in England. As to the conductivity of the iron alloys, it was in every case much lower than that of pure iron, except in the case of a copper iron alloy, though no definite connection could be made out between the constituents and the conductivity of the alloy. In magnetic permeability the result of most importance was the discovery of an iron alloy, containing $2\frac{1}{2}$ per cent. of either aluminium or silicon, which is more magnetic than even the purest Swedish charcoal iron. The alloy with aluminium is said to have a permeability of 6000. The practical value of this alloy will lie in its application to dynamo and transformer construction, for by using more magnetic cores the weight of a machine may be lessened.

Terrestrial Magnetism.—The United States Coast and Geodetic Survey has published a new and very complete set of magnetic declination tables and magnetic charts, together with a résumé of the principal facts relating to the earth's magnetism. The magnetic survey has been carried on in nineteen States and Territories, including Porto Rico and the Philippines, the magnetic elements having been determined at 258 stations, besides the continuous records obtained at the four magnetic observatories at Cheltenham, Md., Baldwin, Kan., Sitka, Alaska, and Honolulu, H. I.

Interesting features of the work at the Cheltenham and Baldwin observatories were the records obtained of the magnetic disturbances coincident with the volcanic eruption in Martinique and the Guatemalan earthquake. A number of expeditions have been sent to make magnetic and meteorological observations in Antarctic regions. (See ARCTIC EXPLORATION and ANTARCTIC EXPLORATION.) Observations at various magnetic observatories throughout the world are being taken on certain days simultaneously with these observations in extreme northern latitudes.

Velocity of X-Rays.—By far the most important work of the year in connection with the X-rays is the successful attempt, after years of effort, of M. R. Blondlot to measure the velocity of the rays, which he has proved equal to that of light. As the X-rays facilitate the passage of a spark across a gap and render it brighter, he allowed an X-ray tube to act upon the spark gap of a Hertzian resonator placed in the immediate vicinity of a Hertzian exciter, making the same current work the tube and the exciter, but in such a manner that the tube lights up an exceedingly small interval of time before the exciter sparks. This short interval of time is the time it takes the current to traverse the wires leading from the tube to the exciter. When the latter begins to act it uses up all the currents so that the X-rays immediately cease and there is no brightening of the resonator spark, but if the tube is moved several centimetres farther away the spark brightens, because now the X-rays are a little late in arriving and act at the same time as the exciter. By giving different lengths to the wires from the tube to the exciter and adjusting the distance of the tube from the resonator each time until the maximum brightening of the spark is obtained it is found that the distance of the tube from the resonator must be increased just as much as the distance from the tube to the exciter. Therefore the X-rays travel at the same rate as electricity along the wires, which is known to be approximately the velocity of light.

These results strongly support if they do not prove the theory that the X-rays are electro-magnetic pulsations of shorter wave length than light, caused by the impact of the kathode ray particles on the anode or other obstacle in the tube. Such pulses would travel with the velocity of light and have been fairly compared to the sound waves produced by the patter of rain-drops on a roof, which do not combine into a tone, but are propagated as an indiscriminate succession of sudden disturbances rapidly dying away.

Velocity of Light.—A redetermination of the velocity of light has been made at the observatory of Nice, using the toothed wheel and mirror method of Fizeau, but with a much greater distance between the wheel and mirror than had been used heretofore, it being in this case 14 miles. As a result of 1109 observations, the value obtained for the velocity of light is 299,890 kilometres per second, the probable error being estimated at less than 50 kilometres. In an article in the early part of the year, Professor Michelson gave his estimate of the best average of all previous determinations as 299,890 kilometres per second, with a probable error of 60, and also outlined a method of observation, combining the methods of Fizeau and Foucault, by which he thinks the value can be determined with an error not greater than one part in one hundred thousand.

Pressure of Light.—Professors Nichols and Hull of Dartmouth College have continued their work on the experimental proof of light radiation and have obtained with comparatively simple apparatus results which agree with the theory within 1 per cent. According to Maxwell, who predicted the detection of this pressure, its amount upon unit area of a body which receives the light is equal to the energy per unit volume in the medium transmitting the light. M. Lebedew, working on the same subject, has also obtained further results confirming the theory. In the application of the theory to the explanation of the repulsion of comet tails by the sun, it has been pointed out that when the light is intercepted by very small particles the pressure is not proportional to the area, but its dependence on the size of the particle is a more complicated matter, owing to the fact that when the light waves are longer than the particles, diffraction phenomena play an important part. This necessitates a partial revision of the theory as advanced by Arrhenius and others. Nichols and Hull have caused mixtures of fine particles of light and heavy materials, for instance pollen and emery dust, to fall through exhausted tubes and by turning on a flash of light, have been able to observe the deflection of the lighter particles by the light, the emery dust falling more steadily. See ASTRONOMICAL PROGRESS.

Spectrum Analysis.—Fabry and Perot have made a series of determinations of the absolute wave lengths of a number of spectrum lines by means of a special form of interferometer, by the use of which the lines could be directly compared in wave length to the red cadmium line which Michelson and Benoit measured accurately in terms of the standard international metre. In the case of the lines occurring in the solar spectrum the ratios of the wave lengths by this determination and from Rowland's tables are given, and lie between 1.0000286 and 1.0000381.

Matter and Ether.—Of the experiments bearing on the yet unanswered question

of the effect of motion through the ether on ordinary matter, the most important one of the year has been one done by Lord Rayleigh to discover if possible whether the rotation of the plane of polarization of light propagated along the optical axis of a quartz crystal is affected by the direction of this axis relative to that of the earth's motion in its orbit. Using a train of five very fine quartz crystals, each 5 cm. long in the direction of the optical axis, he was unable (when the system was reversed in the direction of the earth's orbital motion) to detect a variation as great as a twenty-thousandth part of the whole rotation of the plane of polarization. Thus another experiment has been added to the list of those in which no connection between the optical properties of matter and its motion through the ether can be detected.

Photometry.—Prof. C. P. Matthews, of Purdue University, has devised a photometer that gives the mean spherical candle power with the ease of a simple photometric measurement. A double ring of mirrors produces on one side of the photometer screen an illumination proportional to the mean spherical candle power of the lamp under test, while the other side of the screen is made equally bright by adjusting the distance of the standard lamp from the screen. The instrument is as well adapted for gas burners as for electric lamps.

Thermometry.—The viscosity of gases has been suggested at various times as a basis for high temperature measurements. M. A. Job has now devised a viscosity apparatus in such a way that the variations of the viscosity of a gas with the temperature, and therefore the temperature itself, may be conveniently measured. The gas generated by the passage of a known current through an electrolytic cell containing a solution of soda is forced through the 1 mm. bore, almost filled by a platinum wire lying along it, of a porcelain tube. Instead of measuring the volume of gas that escapes, a much easier measurement is made, that of the gas pressure in the electrolytic cell, by means of a sensitive manometer. The relation between the pressure and the temperature of the porcelain tube is a simple linear one, and the method yields excellent results. To calibrate the manometer the apparatus is tested by means of any known thermometer.

Temperature of the Sun.—Mr. W. E. Wilson has repeated with different apparatus his experiments on the effective temperature of the sun. A porcelain tube 2 feet in length and 1 inch in diameter, heated to any desired degree in a gas furnace, was used for the source at known temperature, for the interior of such a tube appears to very nearly fulfill the condition of a perfect radiator. The solar energy was reflected from an unsilvered glass heliostat mirror. The mean effective temperature of the sun, using Rosetti's determination of the amount of terrestrial atmospheric absorption, is 5773° Centigrade. If the absorption due to the sun's atmosphere be considered, the value is near to 6500° Centigrade.

The United States National Bureau of Standards carried on its work in temporary quarters during the year 1902, but at the end of the year was preparing to move into its new laboratories in Northwest Washington, which were being built with a view to the very highest attainments in accurate measurements.

The British National Physical Laboratory.—The opening of the National Physical Laboratory, which occurred on March 19, was an important event for physical science in England. The laboratory, which is an institution for physical research and standardization of physical measures and instruments, quite similar to the German Physikisch-technische Reichsanstalt and the United States Bureau of Standards, is located at Bushey House. At the opening, speeches before a distinguished company of scientists were made by the Prince of Wales, Lord Kelvin, Lord Rayleigh, and Mr. Balfour. Lord Rayleigh is chairman of the general board of the laboratory; Professor Glazebrook is the director of the laboratory, and has a corps of eighteen assistants. Much of the equipment of the laboratory comes by gifts from individuals and commercial firms, although the government erected the buildings at a cost of £19,000. The old-established Kew Observatory now forms part of the laboratory.

Medals and Prizes.—The Hodgkins gold medal of the Smithsonian Institution, the first since 1899, "for the increase and diffusion of more exact knowledge in regard to the nature and properties of atmospheric air in connection with the welfare of man," has been awarded to Prof. J. J. Thomson, of Cambridge, for his investigations on the conductivity of gases, especially those that compose the atmospheric air. The Hughes medal of the Royal Society has also been awarded to Professor Thomson for the same investigations. The Royal Society has awarded the Davy medal to Professor Arrhenius of Sweden for his dissociation theory, and a Royal medal to Prof. H. Lamb for his investigations in mathematical physics. Nobel prizes in physics have been awarded to Professors Lorenz and Zeeman, in Holland. The Accademia dei Lincei, at Rome, has awarded a Royal medal to Professor Cantone, of Pavia, for researches in the phenomena of elasticity of overstrained bodies.

The Berlin Academy announces a prize of 4000 marks for the best research, combining theory with experiment, in connection with the role played by electrically charged particles, called electrons, in the ordinary conduction in metals and gases and the phenomena of absorption and emission of light. The prize is not to be awarded until after the end of 1904.

The Metric System.—The committee on coinage, weights, and measures, of the House of Representatives, made in the spring, in connection with a bill requiring the early adoption of the metric or decimal system of measures in the government departments, a thorough investigation of the advisability of such a move. Representative scientists, engineers, manufacturers, and business men were asked to testify before the committee, and resolutions advocating the passage of the bill were sent in by most of the scientific and engineering societies of the country. The result was an overwhelming mass of opinion in favor of the early adoption of the metric system in all measurements. The prospects for the passage of the bill were considered favorable at the close of the year.

At a conference between Mr. Chamberlain, secretary of state for the British colonies, and the prime ministers of the self-governing colonies, a strong resolution was passed affirming the desirability of the adoption of the metric system by all the British colonies.

PHYSIOLOGY, CHEMICAL. See **CHEMISTRY** (paragraph Physiological Chemistry).

PIERCE, HENRY MILLER, one of the organizers of the army ambulance corps, died February 19, 1902, at Ocala, Fla. He was born October 6, 1831, in Susquehanna County, Pa.; graduated at Colby College, and became president of Rutgers Female College in 1860. In the early part of the Civil War, with Dr. Lieber and Judge White of New York, he organized the ambulance corps and supervised its work. In 1887 he founded a city in Tennessee, the government of which was based on his theories of municipal affairs. It is now known as West Nashville, and is one of the most flourishing cities of the State. He was one of the first to exploit the commercial value of wood alcohol and introduce it into the market.

PIOUS FUND. See **ARBITRATION, INTERNATIONAL** (paragraph Pious Fund Decision).

PLANETOIDS. See **ASTRONOMICAL PROGRESS.**

PLANITZ, KARL PAUL VON DER, a German soldier and statesman, died August 19, 1902. He was born September 20, 1837, in Hohengrün, Vogtlande, and entering the German army in 1855 became a lieutenant in 1856, an officer of the general staff in 1861, and participated in the Holstein expedition of 1864. In 1867 he served as adjutant to Crown Prince Albert, and during the Franco-German War was on the general staff of the Twelfth Army Corps stationed with the army of the Meuse. From 1873 to 1883 he was Saxon military attaché at Berlin, and was then made chief of staff of the Saxon army corps. He became a major-general in 1888, commander of the Forty-fifth Brigade of Infantry in 1889, succeeded Count Fabrice as Saxon minister of war in 1891, and in 1896 was made infantry general. He was one of the party that accompanied Prince Henry of Prussia on his visit to the United States in 1902.

POLITICAL AND SOCIAL SCIENCE, AMERICAN ACADEMY OF, founded in 1889 to promote the political and social sciences. President, Prof. L. S. Rowe, Ph.D., University of Pennsylvania; secretary, Prof. James T. Young, Ph.D., University of Pennsylvania. Membership, 1990, scattered over every State in the Union and thirty-four foreign countries. *The Annals*, a bi-monthly publication, is the organ of the Academy. The annual meeting for 1902 was held at Philadelphia, April 4 and 5. Hon. Martin A. Knapp delivered the annual address, on *Social Effects of Transportation*, in which he showed the immense effects of the modern development of transportation means upon the form and organization of society. At the first session, Senator Marcus A. Hanna presented a paper on *Industrial Conciliation and Arbitration*, which was a plea for organization of both employees and employers, and the arbitration of differences through their responsible representatives. Only by means of better and more responsible labor organization can wasteful strikes be avoided. The employer must go more than half way in the matter of conciliation, for he is responsible for the conduct of industry and the wages of the employees. President Samuel Gompers, of the American Federation of Labor, followed with an address on the *Limitations of Conciliation and Arbitration*, in which he strongly objected to compulsory arbitration and advocated

the strike as the final appeal of workmen for justice. *Results Accomplished by the Industrial Department of the National Civic Federation* was the subject of a paper by Hon. Oscar S. Straus, former United States minister to Turkey. *Cooperation of Labor and Capital* was treated by William H. Pfahler. Alexander Purves, treasurer of Hampton Institute, Virginia, spoke on *Harmonizing Labor and Capital*, strongly advocating profit-sharing and investment of earnings by employees in the industry with which they are connected. The second session was taken up with the housing problem, at which Hon. Robert W. De Forest, tenement house commissioner of New York City, spoke on *Tenement House Regulation*; Miss Jane Addams, of Hull House, Chicago, presented the *Housing Problem of Chicago*; the report prepared by the Octavia Hill Association gave some of the conditions in Philadelphia; *Housing Conditions in Boston* was treated by Robert Treat Paine; and *Housing Conditions in Jersey City* was the subject covered by Mary B. Sayles, fellow of the College Settlements Association. The first session on April 5 was devoted to the child labor problem. In a paper on *Child Labor Legislation*, Mrs. Florence Kelley, secretary of the National Consumers' League, rehearsed briefly the legislation that has been enacted to protect children. The business man's views were presented by Mr. Franklin N. Brewer, general manager Wanamaker store, Philadelphia, in a paper on *Child Labor in the Department Store*. Mr. Brewer thought the time spent in school was a handicap to business success. The methods of the shop and store are being more and more introduced into the schools, but the reverse is not true of this country at least. Mr. Brewer held that boys and girls may earn a living in the shop and at the same time acquire an education just as broad and much more practical than can be obtained in the schools. The boys and girls of the Wanamaker store are organized into schools, where they are taught the elementary branches. This taking over the school into the shop he thought more practical than the attempt to take the shop into the school. *The Necessity for Factory Legislation in the South* was urged by Hayes Robbins, dean of the Institute of Social Economics, New York. *Child Labor in New Jersey*, by Hugh F. Fox, president New Jersey State Board of Children's Guardians, showed the unreliability of official figures as to the number of children employed or the conditions of employment in New Jersey factories. The age limit (sixteen years in New Jersey) is habitually disregarded, and, worse, the physical condition of children is almost totally neglected. The legislation in Belgium regarding child labor was reviewed in a paper by Prof. Ernest Dubois, of the University of Ghent. It remains to be seen whether the law can or will be enforced. Mr. Henry White, secretary of the United Garment Workers of America, gave one of the most interesting addresses of the meeting on *Machinery and Labor*. He showed the futility of opposing the adoption of machinery and maintained that with intelligent acquiescence on the part of workmen the market will expand so quickly with the cheaper machine production that very soon more men will be required in the industry than before the introduction of machinery. He cited the example of the Typographical Union, which accepted the linotype without protest and thus succeeded in securing a rate of wages considerably above that received by hand compositors. Each machine displaced three men, but in less than three years, owing to the increase in the printing business, more men were employed than ever before. The great evil of machine production is the exploitation of child labor. This evil must be overcome by educating the public conscience. *Tendencies of Factory Legislation and Inspection in the United States* was dealt with by Sarah S. Whittelsey, Ph.D., New Haven, Conn. Legislation has continually progressed toward exact and minute regulation, but inspection always lags far behind legislation, until it has come to be believed that factory legislation is not intended seriously, but is merely a sop to keep the labor vote solid. Factory inspectors should be distinct from the ordinary police. The lack of uniformity in labor laws in the different States is one of the most embarrassing circumstances. A national law is impossible, and the probability of anything like concerted action by the individual States is remote. The attitude of the courts is rather favorable to an increased supervision of labor conditions.

POLITICAL ECONOMY. *General and Theoretical Works.*—No works of first importance on theoretical economics appeared during 1902. The most remarkable book in this field was, perhaps, Professor Patten's *Theory of Prosperity*, which is full of suggestion and marked by the author's clear, aggressive thought. The classical division of income into wages, profits, and rent is regarded as an arbitrary arrangement based on the fact that there were three distinct classes in England at the time when the division was made a part of economic science. At present, in the United States, at least, the old distinction between capitalist and landlord has broken down, and the barriers separating wage earners from other groups are weakened and growing weaker. Under a free economic organization all class barriers would be swept away and with them would disappear all so-called functional distribution. The entire income of society might then be called wages,

interest, or rent, according to the point of view. Professor Patten makes consumption the basis of economic life. Man starts out with a surplus of energy which he employs in producing goods, which he consumes, giving a new surplus of energy to be used up in further production, thus completing the cycle. It would be possible to live and work without pain, goods never becoming scarce enough to have value, if it were not for the growth of wants. "Wants grow more rapidly than productive power. This is an elementary law to which there are no exceptions." For this reason goods acquire a scarcity value. In more evolved societies men derive their incomes more or less from monopoly advantage. Monopoly is possible because productivity increases irregularly in different industries, giving some an advantage in the adjustment of prices. The most important check upon monopoly is the power of the consumer to substitute other articles for those controlled by the monopolist. When substitutes are found for all monopolized goods, there will be no more monopoly. This condition is to be brought about by invention and mobility of consumers, not as has been heretofore suggested, by legal restrictions and free competition among producers. What one monopolist gains all other monopolists lose, because there is a definite monopoly surplus, which limits monopoly profits. Interest is ascribed to discount of the future, but in a different sense from that employed by Böhm-Bawerk. He makes consumption, as might be expected, the basis for interest. He abandons the theory of decreasing utility and boldly says the greater the quantity of goods, the greater is their value per unit. He arrives at this startling conclusion by means of his theory of the multiplying wants of man, each new want being of a higher order than the one preceding. In the author's view this estimating at present values, of goods that will have increased value in future, because of increased demand, accounts for interest. In Part II. Professor Patten takes up forces of heredity, asserting that as a people progresses, the toilers continue to receive the low wages to which they are accustomed, leaving the increased fund of social income to be seized by exploiters of labor. Two things act to overcome this maladjustment: (1) the exploiters die off from over-nutrition or debauchery; (2) they become philanthropic and share the surplus with their fellowmen. One of the books of the year which will arouse much discussion is *Our Benevolent Feudalism*, by W. H. Ghent. The author thinks society is moving toward a new form of feudalism, in which the laborer will have a fixed place with enough to keep him comfortable and contented, for that is the employer's interest. Strikes will be impossible in any one industry, as the employers will be combined to prevent such disturbances. Government, while retaining the form of democracy will become a virtual oligarchy. Although the views expressed are extreme and even pessimistic, yet the trenchant vigor of the criticisms are too true to be put lightly aside. Another book that attracted considerable attention was *Psychologie économique*, by G. Tarde, professor in the College of France. The author proceeds upon the same principles which he laid down in his well-known sociological works, viz., the study of the beliefs and desires of individuals and their mutual inter-psychological effects. Economics falls into three divisions, "Economic repetition," "Economic opposition," and "Economic adaptation." The fourfold division of the classical economists is rejected. Capital is regarded as psychological—the sum of existing inventions, i. e., the knowing how to produce.

The periodical literature in economic theory was quite as scanty as that in books. Professor Homer J. Davenport, of the University of Nebraska, wrote on *Proposed Modifications in Austrian Theory and Terminology*, for the May number of the *Quarterly Journal of Economics*. The same number contains a long article, *Böhm-Bawerk on Rae*, by Charles W. Mixer. *The Variations of Productive Forces*, by Professor Charles J. Bullock, of Williams College, appeared in the August issue of the same journal. Professor Bullock sums up his statement as follows: "The laws of the variation of productive forces: I. Of a given area of land (Law of diminishing returns); II. Of a single plant or establishment (Law of economy in organization); III. Of an entire industry: (1) Under static conditions (Law of varied costs); (2) Under dynamic conditions (Law of increasing or decreasing costs)." *The Roundabout Process in the Interest Theory*, by Frank A. Fetter, of Cornell University, in the November issue is a criticism of the Austrian theory of interest.

Historical and Statistical Works.—In the field of historical and statistical economics, a great mass of literature was produced, though none of very great importance. The most significant treatise on economic interpretation that has appeared recently was the volume called *The Economic Interpretation of History*, by Professor Edwin R. A. Seligman, of Columbia University, New York. The thesis of this work, which is the expanded and developed form of Professor's Seligman's address to the Economic Association in 1901, is contained in this statement: "The existence of man depends upon his ability to sustain himself: the economic life is therefore the fundamental condition of all life." Professor Seligman traces the history and an-

swers categorically the criticisms of the economic interpretation; but he vanquishes the critics, not so much by proving them to be in the wrong as by defining economic materialism so as to exclude all the points objected to. He says there is no "economic man" just as there is no "theological man." There can be as many ways of interpreting history as there are classes of human activity, but the economic interpretation is the most fundamental. As humanity advances the economic forces will hold less and less sway; but though the theory of economic interpretation should be abandoned, it must be recognized that it has greatly stimulated and strengthened human intelligence.

As usual, the German literature in the field of historical economics is greater in volume than that of all other countries combined. *Der Moderne Kapitalismus* is a two volume work by Professor Werner Sombart, of the University of Breslau. Volume one treats of the genesis of capitalism and volume two gives the theories of its development. Professor Sombart thinks that capital originated from the rent surplus of land. Professor Gustav Schmoller, of Berlin University, published a work called *Die historische Lohnbenegung und ihre Ursachen*, which is marked by the author's usual profundity. Other important works are *Zur Geschichte der Werththeorie in England*, by Dr. W. Liebknecht; *Studien zur Theorie und Geschichte der Handelskrisen in England*, by Dr. Michael von Tugan-Baranowsky; *The American Cotton Industry*, by T. M. Young; *Financial Crises and Periods of Industrial and Commercial Depression*, by Theodore Burton. The periodical literature, though considerable in extent, is hardly important enough to catalogue.

Labor and Capital.—The literature on trusts and labor conditions like that on the more purely historical economics was almost limitless in amount, but no new developments of importance are to be noted. A valuable bibliography with the title, *A List of Books Relating to the Trusts*, was prepared by A. P. C. Griffin of the bibliographical department of the library of Congress. Bolen's *Plain Facts as to the Trust and the Tariff* is a sane work prepared for the purpose of popularizing the most recent theories regarding the proper status and control of trusts. Paul de Rousiers published *Les syndicats industriels de producteurs en France et a l'etranger*, which contained the most recent information, especially regarding the French combinations and agreements. In the field of labor organization several books may be mentioned; *De la division du travail social*, by Emil Durkheim. *Le contrat collectif de travail*, by Arthur Rousseau is a thorough study of collective bargaining between employers and employees from both the economic and legal aspects. *Le contrat de travail* by Paul Bureau is only secondarily concerned with labor, being an argument for the extension of industrial capitalistic organization as a means of increasing wages. The example of industrial organization in the United States is appealed to for support of the theory. A new edition of *Industrial Democracy* by Sidney and Beatrice Webb appeared. The *Quarterly Journal of Economics* for February contains an article by Prof. Edward S. Meade, University of Pennsylvania, on *Capitalization of the United States Steel Corporation*. A reply to Professor Meade's paper was made by G. C. Selden in the May issue. *The Rise and Supremacy of the Standard Oil Company*, by Gilbert Holland Montague, also in the February number, is noteworthy. The *American Journal of Sociology* for July contains an article on *The Trust Problem Restated*, by Victor S. Yarros. Mr. Yarros suggests that the question of credit, the machinery for supplying capital to industry, has been much neglected in considerations of the trust question. "A rigid, inadequate, and crude currency and banking system favors concentration and monopoly." It discourages small independent enterprises. Improvement in banking laws would do much to dispose of the evils of trusts. The *Anthracite Conflict*, by Peter Roberts, appeared in the *Yale Review* for November. *Trusts and Prices*, by I. A. Hourwich, of Columbian University, in the *Annals* for November, deals with the material collected by the Industrial Commission. The *Political Science Quarterly* for September had an article by John Martin, *Do Trade Unions Limit Output? Authoritative Arbitration* by Prof. John B. Clark, of Columbia, advocating compulsory settlement of differences between labor and capital, and *The San Francisco Labor Movement*, by Thomas Walker Page, appeared in the December issue. A paper by Francis B. Forbes, on *Beneficiary Corporations Doing Business in Massachusetts*, came out in the *Quarterly of the American Statistical Association* for March. The English *Economic Journal* contained *American Trusts and English Combinations*, by Evelyn Hubbard in the June number, and *Business Aspects of British Trusts*, by H. Macrosty in the September issue. *The Effect of Factory Legislation on Wages* is considered by G. H. Wood in the June issue of the *Journal of the Royal Statistical Society*. The German periodicals, as usual, contained many thoughtful essays on problems of capital and labor. The most noteworthy perhaps were: *Die Frage der Regelung der Fabrikarbeit verheiratheter Frauen nach den Ergebnissen der in Jahre 1899 veranstalteten Reichsenquete*, by Dr. von Brandt; *Der Kapitalismus*, by W. Neurath; and *Der Fabrikbegriff und die Handwerksorganisation*, by Hugo Riekes,

which appeared in the *Jahrbücher für Nationalökonomie und Statistik*, for April and August.

Finance, Taxation, Money, etc.—Limitations of space prevent the cataloguing of more than a very few of the more important works in this field of economics. *Savings and Savings Institutions*, by James Henry Hamilton, must be given high rank. This book exalts the savings bank as the most conservative, the most logical, and the most hopeful means of raising the workingmen. The author advocates governmental action to foster habits of economy, but criticises unfavorably the German system of compulsory insurance and such schemes. *Statistical Studies in the New York Money Market*, by John Pease Norton, is a highly technical and important application of the modern statistical method to economic questions. *The Evolution of Modern Money*, by William Walter Carlile, is a historical work of considerable value.

The *Annals* contained the following: *The Taxation of Corporations in the United States*, by Francis Walker, Cleveland, O., in the March number; in the November number, *Responsibility of the National Banks in the Present Crisis*, by Albert S. Bolles; *Is the United States Treasury Responsible for the Present Monetary Disturbance?* by Frederick A. Cleveland, University of Pennsylvania; *The Currency of the Philippine Islands*, by Charles A. Conant, of New York; *The Financing of the South African War*, by F. R. Fairchild, of New Haven, Conn.; *The Work of the Promoter*, by Edward S. Meade, University of Pennsylvania; *The Independent Treasury vs. Bank Depositories*, by Charles S. Potts, Agricultural College of Texas. *Excise Taxation in Porto Rico*, by Prof. J. H. Hollander, Johns Hopkins University in the *Quarterly Journal of Economics* for February; and *Taxation in the Philippines*, by Prof. C. C. Plehns, University of California, in *Political Science Quarterly* for March give full information of the administration of the taxes in our island dependencies. Without pausing to note the endless array of German periodical literature on the subjects of banking, finance, and taxation, mostly of a local value only, attention should be called to two articles appearing in the *English Economic Journal* for September: *Taxation of Site Values*, by C. F. Bickerdike and an *Imperial Zollverein with Preferential Tariffs*, by C. F. Bastable. Of special interest is *A Financial Retrospect* by Sir Robert Giffen, which appeared in the *Journal* of the Royal Statistical Society for March.

Two encouraging features of the economic writings of 1902 are discernible to the careful observer: First, the more exacting application of the statistical method in attacking social problems; and second, the recognition that theory must not be submerged in a confusion of facts and figures. In America, at least, the historical school in distinction from the theoretical school has no existence. The Germans still hold aloof, preferring to attack economic problems by their chosen historical method.

POLO, in 1902, enjoyed the most active season of its history in the United States and greatly increased the number of its followers, extending from the circles of the exclusively wealthy to include teams from many organizations throughout the country. The event of chief importance during the season was the visit, to England, of an American team, consisting of R. L. Agassiz, Foxhall Keene, J. E. Cowdin, L. Waterbury, and J. M. Waterbury, Jr., substitute. Three matches, in contest for the International Polo Cup, won by England at Newport, R. I., in 1886, were played at Hurlingham and resulted as follows: May 31, United States 2 goals, England 1; June 9, England 6, United States 1; and June 21, England 7, United States 1; thus leaving the possession of the championship with England. The American players attributed their defeat to the unacclimated condition of their ponies and to a difference in rules, which in England permits the hooking of mallets, prohibited in this country. The senior championship, Saratoga, N. Y., August 2 to 7, was won by Lakewood, which defeated the Bryn Mawr team 5½ goals to 3¼. In the junior championships, Saratoga, July 29 to 31, the Rockaway team defeated the Country Club of Westchester in the final game, 12½ to 9.

In a match game played on the public polo grounds, Van Cortlandt Park, New York City, West Point defeated Squadron A by 9½ goals to 2½.

POOL. To followers of this game, the principal event in 1902 was the championship tournament, held in Brooklyn, N. Y. Of nine contestants, Charles Weston and W. H. Clearwater tied at 7 victories and 1 defeat, and the deciding game was won by the latter, 125 to 105. Grant Eby, who finished seventh in the list, challenged Clearwater for the championship and defeated him, 600 to 447. Eby was in turn challenged by Patrick Walsh, who had finished fifth in the tournament. Eby won the match, 600 to 375.

PORTO RICO, the smallest of the Greater Antilles, lies to the east of Haiti, from which it is separated by Mona Passage. The area is approximately 3606 miles. The best harbor is that of San Juan, on the north coast; on the south the

only harbors for vessels of ordinary draught are those of Ponce and Guanica. The population, according to the census taken by the United States government in November, 1899, was 953,243. Of this number 589,426, or 61.8 per cent., were whites, and 363,117, or 38.2 per cent., were colored, including those of mixed blood.

Government.—Porto Rico was acquired from Spain by the United States in virtue of the treaty of Paris, signed December 10, 1898, and ratified by the United States Senate February 6, 1899. It was governed as a military possession until May 1, 1900, when it was made by Congress a body politic, called *The People of Porto Rico*, and vested with some autonomous administrative and legislative powers. Under this act the executive power is vested in a governor and cabinet of five, appointed by the President; and the legislative power in a legislature, of which the governor, cabinet, and five other appointed members constitute the upper chamber, and thirty-five popularly elected members the lower. The upper chamber may reject measures of the lower, the governor has the usual qualified power of veto, and Congress retains the right of absolute veto. A resident commissioner to Washington is elected by popular vote. As in the case of the Territories of the United States, appeals lie from the insular court to the Supreme Court at Washington. In accordance with the organic act, free trade was declared between the United States and Porto Rico on July 25, 1901.

Finance.—The cash in the treasury of Porto Rico on June 30, 1901, was \$563,650.54. The total receipts during the fiscal year ending June 30, 1902, were \$4,472,192.63, and the total expenditures \$3,113,721.77, leaving a balance on June 30, 1902, of \$1,358,468.86. Besides this, there was, in the United States treasury, \$431,128.24 not yet turned over to Porto Rico, but allotted to it for permanent improvements from the revenues collected in the United States on importations from Porto Rico, making the total cash assets of the insular government on July 1, 1902, \$1,789,597.10. Of the amount in the Porto Rican treasury on July 1, 1901, \$74,631.41 were insular funds proper, while \$489,019.13 were a part of the trust fund given to Porto Rico by the United States. Further allotments from this trust fund, amounting to \$1,009,925, were made during the year, of which some \$486,000 were expended mainly for road and schoolhouse construction, leaving a balance of the trust fund in the insular treasury at the end of the year of \$1,007,570.13. Other trust funds brought the amount up to \$1,043,868.46, so that the insular revenues proper remaining at the end of the year were \$1,358,468.86 less \$1,043,868.46, or \$314,600.40. Of the insular revenues proper during the year \$848,258.30 were derived from customs receipts; \$1,497,802.63 from internal revenue (of which 15 per cent. was allotted to the various municipalities); and \$409,784.91 from a property tax of .5 per cent., collected on behalf of the municipalities. The total assessment of property in the island for 1902 was approximately \$110,000,000. While the condition of Porto Rican finances, as shown above, was extremely favorable, it should be borne in mind that the trust fund donated by the United States relieved the insular treasury of heavy expenditures for permanent improvements, which it will be obliged to assume in the near future.

Agriculture.—Porto Rico is pre-eminently an agricultural country, 65 per cent. of its people are engaged in farming and the only manufacturing industries of any importance are those of sugar, tobacco, rum and straw hats. Of the total area of the country, however, only about 20 per cent. is cultivated, while 51 per cent. is pasture land, and 7 per cent. waste land. Of the cultivated lands 82,672 acres in 1900, and 91,000 in 1901, were planted in sugar cane. The area of coffee lands prior to the hurricane of 1899 was about 180,000 acres, while in 1902 they were estimated at 166,000 acres. The tobacco area, also considerably reduced in 1899, was estimated in 1902 at 4222 acres; at the same time 93,508 acres were planted in beans, rice and corn, and 17,176 in fruits. The three principal crops and those comprising the great bulk of the insular exports are sugar, coffee, and tobacco, of which the production in 1900, 1901 and 1902 was as follows: Sugar, 61,500, 95,850 and 185,000 tons, respectively; coffee, 9170, 14,500, and 6500 tons, respectively; tobacco, 3000, 4000, and 5000 tons, respectively. Sugar producing, at present prices, is a very remunerative investment, but new and modern machinery is imperatively required. The two largest factories are owned by Americans, and in 1902 propositions were pending for the completion of a number of other well equipped factories. There is no other Porto Rican crop increasing in area and production so rapidly as tobacco. The increase began with the spring planting of 1901, in anticipation of the removal of the tariff, and continued through 1902. During the past two years Americans have planted some 3500 acres with oranges. In 1902 the best sugar lands were valued at \$150 per acre; tobacco lands at from \$60 to \$75 per acre, and fruit lands from \$40 to \$50 an acre; pasture lands from \$15 to \$20 an acre; and coffee lands from \$10 to \$15 an acre.

Public Lands.—By a congressional act of July 1, 1902, the President was authorized to make reservation, before July 1, 1903, of such lands and buildings belonging

to the United States in Porto Rico as were requisite for military, naval, customs, postal and other public purposes, and to grant the remainder, exclusive of harbor areas, navigable streams and bodies of water, to the government of Porto Rico, to be held or disposed of at its pleasure.

Commerce.—The total value of the exports of merchandise from Porto Rico for the calendar year 1902 was \$13,350,536, and the total value of the imports was \$14,467,627, as against \$10,472,270 and \$10,955,813, respectively in 1901. The exports of domestic merchandise to the United States were \$3,078,648 in 1900; \$6,958,677 in 1901, and \$9,530,548 in 1902. The imports of United States merchandise to Porto Rico amounted to \$4,640,449 in 1900; \$8,751,751 in 1901, and \$12,029,090 in 1902. Thus since the inauguration of American government in the island and the declaration of free trade between the two countries, their commerce has increased by about 200 per cent. The principal items of merchandise shipped from the United States to Porto Rico during 1902 were: Breadstuffs, \$1,146,130; cotton manufactures, \$1,970,828; iron and steel, \$1,642,085; provisions, \$1,455,160; wood, \$594,379; and leather, \$308,588. The leading exports from Porto Rico to the United States were sugar, \$6,754,361, and tobacco, almost entirely in the form of cigars, \$2,192,790. Of the total exports of Porto Rico to foreign countries in 1902, amounting to \$3,676,657, France took \$1,064,394; Germany, \$303,670; and Cuba, \$562,749. The large shipments to France are accounted for by the fact that Porto Rican coffee is accorded preferential treatment in the French markets. During the fiscal year 1902, 222 American and 295 foreign ships entered the harbors.

Banks.—There were in Porto Rico at the end of the fiscal year 1902, eight incorporated banks with an aggregate capital of \$1,417,725, deposits of \$2,489,449, and assets of \$5,359,189. Of these the only bank of issue was the Spanish-American Bank of Porto Rico, chartered by the Spanish crown and permitted to issue notes to three times its paid up capital. The insular authorities objected to this excessive issuing power and the bank agreed to limit its notes. Although under an opinion rendered by the attorney-general of the United States in June, 1900, national banks might be organized in Porto Rico, none were organized until November 10, 1902, when the First National Bank of Porto Rico was chartered to take over the American Colonial Bank, organized under the laws of West Virginia. As stated by the treasurer of the island, there was great need for further banking capital in Porto Rico, realty loans being hard to obtain at 10 to 20 per cent. interest. But the peculiar conditions under which banking had to be done in Porto Rico made it difficult for banks to organize under the national banking laws, which it was strongly urged should be modified. These laws prohibited branch banking, forbade the loaning of money on long-time notes secured on real estate mortgages, and permitted bank issues only to an amount equal to the face value of United States bonds deposited with the treasurer of the United States. One reason, as stated by the insular treasurer, why interest on real estate loans remained so high, was that no general survey of the island had ever been made, and hence all questions of title were in doubt. The legislature of 1902, recognizing this, appropriated \$5000 to enable the governor to co-operate with the United States Geological Survey to secure a general topographical survey of the island. The legislature also passed a law permitting the organization of cooperative savings and loan associations, which follows closely the provisions of the Massachusetts cooperative savings banks act, and provides for official supervision and examination.

Communications.—The work of bettering communications in the island, so necessary to its continued industrial progress, has been pushed steadily forward since the American occupation. At that time, there were in Porto Rico only 177.5 miles of highways. By the end of the fiscal year 1902, 87.5 miles additional had been completed; 65.5 miles of new roads were under construction; 55.3 miles of old roads were under repair; and 160.5 miles of new routes had been surveyed. This work cost \$256,000 during the year 1902. Plans were also perfected within the twelvemonth for the extension of old railway lines, and the building of new ones.

Code Commission.—The commission provided for by an act of the legislative assembly on January 31, 1901, to revise and codify the system of laws, reported to the governor on December 31, 1901, and the report was by him transmitted to the legislature. The commission consisted of Prof. L. S. Rowe, J. M. Keddy and Juan Hernandez Lopez. Penal, criminal, civil and political codes were prepared by them, but for lack of time a code of civil procedure was not undertaken. The penal and criminal codes were practically new, being modeled after American laws; the civil code was a revision, and the political code was mainly a codification of a number of special Spanish laws.

Legislature.—The second session of the legislative assembly of Porto Rico convened on January 1, 1902. The members were all Republicans, the Federal party being unrepresented. The main work of the session consisted in amending and revising the laws that had been passed at the first session in 1901, in order better

to meet existing conditions. Among the laws enacted were an act relating to municipal police; an act reducing the number of municipalities; a general municipal law; and a law modeled largely after that of New Jersey, providing for the regulation and incorporation of domestic corporations, and requiring fees to be paid by them in proportion to the amount of capital stock issued. New acts, following substantially the laws under which the first general election was held in Porto Rico, were passed for regulating elections and the registration of voters. The system adopted was practically that known as the Australian system. A law was passed increasing the excise tax on beer and wine from 15 to 20 cents per gallon and increasing the fee for licenses for the sale of beer, wine, tobacco, arms and ammunition from 20 to 50 per cent.

Judicial System.—New codes of penal law and criminal procedure and also a political code, were enacted by the legislature of 1902. The new penal code and the code of criminal procedure, both taking effect on July 1, 1902, were patterned, with a few exceptions, after the California code. The important changes effected by the new codes were: (1) That judges are given much more discretion in the consideration of aggravating or extenuating circumstances, and in fixing the penalty accordingly; and (2) that various crimes, like embezzlement and seduction, whose prosecution was formerly in the control of the persons wronged, are made public offenses within the cognizance of the public prosecutor. The jury system, established by the legislature in 1901, had not, up to the end of the fiscal year 1902, been invoked to any extent, there having been in the aggregate only twenty-four jury trials. The judicial officers of the island consist at present of forty-eight justices of the peace, five District Courts with general civil and criminal jurisdictions, five judges of the Supreme Court, and a United States District Court. The chief law officer of the government is the attorney-general, who appears before the courts in cases in which the government is interested.

Education.—The report of the commissioner of education for Porto Rico showed that the number of schools open during all or part of the school year ending in June, 1902, was 919, and that 987 teachers were employed, of whom 131 were Americans and 856 Porto Ricans. Of the schools 47, with an average attendance of 1489 pupils and a total enrollment of 2767, were special schools, such as kindergartens, night schools, normal schools, and high schools. The other 882 were graded common schools, with an average attendance of 39,504 and a total enrollment of 59,096. These schools, constituting the basis and by far the greatest part of the educational system, have been rapidly increased, the number being 525 in 1899 and 733 in 1901. But that this number is still entirely inadequate is seen from the fact that the average attendance at all schools was 40,993, while the estimated population of school age is over 300,000. Nevertheless the Porto Ricans have contributed most generously for educational purposes, the municipalities giving in the past year \$120,000, or nearly a fourth, and the insular government some \$500,000, or over a fourth, of their entire revenues. In addition to these sums, \$170,000 were expended, from the refunds made by the United States on Porto Rican duties, for the construction of school buildings, leaving a balance on that account in October, 1902, of about \$175,000, and making a total expenditure to date of \$400,000. For the school year ending in June, 1903, the insular government provided about \$550,000, and it was estimated that not less than 1200 schools would be opened. The common graded schools, similar in their main features to those in the eastern or New England States, practically exhausted the government's resources, and it was only for these elementary schools, moreover, that there was wide public need. A strong plea was made by the commissioner for the establishment either by federal grant or private endowment of an American-Porto Rican university.

Municipal Affairs.—One of the most perplexing problems confronting the insular government from its installation was that of the readjustment of municipal affairs, especially as regards finance. This resulted mainly from the habit of absolute dependence upon a central government engendered by the Spanish régime, and from corruption, inefficiency, and local prejudice. The matters calling for immediate action were, first, to arrange for the large floating indebtedness of the municipalities and to make provision for the construction of needed works of public utility; and, second, to place the whole municipal governmental system upon a stable basis. For these purposes, three important acts were passed by the legislature in 1902. Under these, the number of the municipalities was in the first place reduced from 68 to 46, the smaller and poorer municipalities being consolidated with the larger ones. In the second place, a general municipal law was passed defining the number, duties and salaries of officers; delimiting the expenditures to be made for the various government purposes, and giving the insular treasurer extensive power when necessary to interfere in matters of municipal finance. Finally, the general taxation law of 1901 was so amended as to effect a practically complete divorce between municipal and insular taxation. Authority was given the municipalities to levy a general tax

of 1 mill for school purposes, and it was provided that not less than 25 per cent. of all taxes collected on general property within the rural portions of municipalities should be set aside as special road funds. While the law of 1901 furthermore provided that not less than 10 nor more than 20 per cent. of all municipal revenues should be used for school purposes, the law of 1902 provides that the municipal school fund shall aggregate not less than 15 nor more than 25 per cent. of the municipal revenues. Perhaps the most important feature of the new municipal enactments is that permitting the insular treasurer to prescribe for all municipalities a uniform system of accounting, authorizing him to inspect such accounts, and directing the municipal authorities to submit to him periodical reports. It was also provided that in framing their annual budgets each municipality should, first of all, arrange to meet contracts already entered into or deficits from previous years. So long as these conditions are observed, the insular government cannot intervene; but if the conditions are not met, the treasurer is given extensive power to alter or amend succeeding budgets, in his discretion. The municipalities are allowed full freedom of action so long, and only so long, as they fulfil their legal obligations. The success of the endeavors to place the municipal finances of the island upon a stable basis was shown by the successful floating of municipal bonds, amounting to \$1,110,000, during 1902. Of the aggregate amount issued, \$545,476.09 was for the payment of outstanding obligations, and \$554,523.91 was for public improvements.

Territorial Officers.—For 1902: Governor, William H. Hunt; secretary, Charles Hartzell; attorney-general, James S. Harlan; treasurer, William F. Willoughby; auditor, John R. Garrison; commissioner of education, Samuel M. Lindsay; commissioner of the interior, William H. Elliott; United States district judge, William H. Holt; United States district attorney, N. B. R. Pettingill; resident commissioner to the United States, Frederico Degetau.

Supreme Court: Chief justice, José S. Quinones; associate justices, Louis Sulzbacher, José C. Hernandez, José M. Figueras, and James H. McLeary.

PORTUGAL, a constitutional monarchy of western Europe. The capital is Lisbon.

Area and Population.—The area, including the Azores and the Madeira islands, is 30,038 square miles, and the population, according to the preliminary returns of the census of 1900, was 5,428,659, showing an increase of 378,930 since 1890. The largest cities are Lisbon, 357,000; Oporto, 172,421; and Braga, 24,309. The state church is the Roman Catholic, but there is religious toleration. The total Protestant population, however, does not exceed 500. The pupils in the public and private elementary schools in 1890 numbered 237,791. There is a system of government normal and technical schools, colleges of law and medicine, and the University of Coimbra (founded in 1290), with 1684 students in 1901. Primary education is only nominally compulsory. The percentage of illiterates in the country in 1890 was 79.2.

Government; Army and Navy.—The executive authority is vested in a king, assisted by a ministry of seven members responsible to the legislature, or Cortes. The Cortes consists of two branches, a chamber of peers, appointed by the king, and a chamber of deputies, elected for a four-year term, on a limited franchise.

There is a standing army of 33,068 officers and men, which can be recruited up to a war footing of 111,137, or with the reserves, 175,380. The personnel of the navy numbered 4898 men. The steam vessels of the navy, including only one armed battleship, numbered 39, with a small fleet of old-fashioned sailing vessels.

Finance.—The monetary standard is gold, and the unit of value is the milreis, valued at \$1.08. The finances of the country have been in a bad condition for many years, and successive finance ministers have tried in vain to solve the problem that the increasing annual deficit involves. Only five times since 1851 has the budget shown an excess of receipts over expenditures. The receipts for 1901-02 amounted to 53,269,747 milreis, and the expenditure to 55,239,748 milreis. The budget estimates for 1902-03 placed the receipts for the current financial year at 54,913,074 milreis, and the expenditure at 55,861,938 milreis. The greater part of the revenue is derived from direct and indirect taxation. The national debt (1901) is £165,596,862, but there is in addition a floating debt of 51,537,484 milreis, which is a heavy drag on the treasury, and the government is anxious to merge it into the other national debt. In May, 1902, the passage of a bill for the conversion of a part of the external debt created widespread discontent. (See below.) In November there were rumors of a new loan, which it was expected would be floated with difficulty, owing to the recollection of the outrageous treatment of former bondholders in 1893. The chief circulating medium is paper money, of which there is a total note circulation of 127,230,369 milreis, 68,154,396 milreis of which are notes of the Bank of Portugal and the rest notes of private banks.

Commerce, Industries, etc.—The chief products are wine, wheat, rye, maize,

oranges, tomatoes, and potatoes. There are valuable mineral deposits of iron, copper, coal, lead and sulphur, but the mines are little developed, the entire value of the product in 1900 amounting to 2,116,718 milreis. The entire industrial population in 1900, exclusive of those engaged in agriculture, numbered 447,620. Cotton cloth is the principal manufactured article. The imports and exports (in milreis) for the years 1898-1901 were as follows:

	1898	1899	1900	1901
Imports	50,809,447	51,538,465	60,221,703	57,868,206
Exports	33,203,241	30,020,294	32,564,035	28,283,659

The figures for 1901 do not include coin and bullion. The export of wine, the most important product, amounted in 1900 to 82,866,090 litres, valued at 10,628,535 milreis. The length of railways open for traffic in 1901 was 1464 miles, of which 597 miles belonged to the state.

History.—Disturbances occurred in May and June, as a result of the introduction of a government measure in the chamber of deputies approving an arrangement with Portugal's foreign creditors for the conversion of the foreign debt, by which a percentage of the customs receipts was to be administered by a commission for the benefit of the creditors. Protests were lodged by merchants and by officers of the army and the navy, but the king refused to consider them, and demonstrations of the students at Coimbra and Lisbon had to be stopped by the police. The bill, in spite of the opposition, passed both the chamber and the peers, and at once received the assent of the king. It was supported unanimously by the Clerical or Conservative party, which is dominant in both houses, and which can always be depended upon to vote blindly for any measure the government submits. The Progressists or Liberals, and other anti-ministerial groups, are, on the other hand, just as blind in their opposition to anything that has the ministerial stamp of approval upon it. On November 6 a severe earthquake occurred in Guarda Beira province, resulting in serious loss of life and property.

PORTUGUESE EAST AFRICA. See EAST AFRICA, PORTUGUESE.

PORTUGUESE GUINEA, a colony of Portugal on the western coast of Africa, between French Guinea and Senegal, has an estimated area of 4440 square miles and an estimated population of 820,000. For the fiscal year 1902 the estimated revenue and expenditure were 126,040 milreis, and 208,080 milreis, respectively. (The face value of the milreis is \$1.08.) The chief products are palm oil, wax, and rubber. Imports and exports in 1899 were valued at 950,828 milreis and 332,979 milreis, respectively; exports in 1900, 401,455 milreis.

PORTUGUESE INDIA. See INDIA, PORTUGUESE.

PORTUGUESE WEST AFRICA. See ANGOLA.

POTATOES. The potato crop of 1902 was a large one and the yield per acre was unusually high. The short crop of 1901 caused an unprecedented acreage to be planted. The season was not favorable in the spring, and during the summer the rain was excessive, causing much rot to develop in the early fall, in the East especially. In the New England States and New York there was extensive damage from rot. These conditions interfered to prevent what was at one time predicted

*Average.

would be a record-breaking crop. As it is, the total production has only been exceeded once in this country, in 1895. Returns for this crop are made by the United States Department of Agriculture for every State and Territory except Arizona. Potatoes of excellent quality were produced on a small scale at a number of places in Alaska, where the growing of this crop is being taken up to a limited extent by the natives. The production in the States having 40,000 acres or upwards in this crop, and the totals for the United States, are given in the foregoing table.

Although the crop exceeded that of 1901 by nearly 100,000,000 bushels, it was valued at nearly \$10,000,000 less than the 1901 crop, on account of the lower prices which prevailed. Good crops were harvested in 1902 throughout most of the Canadian provinces, although there also the rot caused much damage. The production reported for Ontario was 13,886,200 bushels, and for Manitoba 3,568,344 bushels. The crop in Russia, 1,044,861,365 bushels, was about 17 per cent. above the five-year average; and the crop in Sweden, 56,570,117 bushels, was considerably above the average for the past ten years.

The unusually short crop of potatoes in this country in 1901 caused a heavy increase in imports, the amount for the fiscal year ending June 30, 1902, being 7,656,162 bushels (valued at \$3,160,801), against 371,911 bushels in the previous year. With two exceptions this was the heaviest importation of potatoes ever made. The short crop of 1881 resulted in imports the following fiscal year of 8,789,860 bushels, and another short crop in 1887 was followed by imports of 8,259,538 bushels. Curiously enough, in spite of the shortage in 1901, 528,484 bushels of this crop were exported in 1902. As a rule neither the exports nor the imports of potatoes are important.

POWELL, JOHN WESLEY, director of the United States Bureau of Ethnology, died September 23, 1902, at Haven, Me. He was born at Mount Morris, N. Y., March 24, 1834, of English parents, who removed to the west while he was quite young. After educating himself for a time at home he attended Oberlin College and Illinois College (Jacksonville, Ill.). Adopting the teachers' profession, he spent his vacations in travel and exploration and in collecting geological specimens. When the Civil War broke out, Powell enlisted in the Twentieth Illinois Regiment, in which he soon became a second lieutenant. At the battle of Shiloh he lost his right arm, but served through the war, retiring from the army with the rank of major. He then resumed scientific pursuits and became professor of geology at Illinois Wesleyan University. In 1867 he made his first geological exploration of the Colorado mountain region. In 1868 another exploring party was organized under government auspices, which carried on the first really scientific study of the Indians, and mapped a vast region never before explored by white men. The exploration of the Green and Colorado rivers was the most important work of this kind accomplished by Major Powell, and, owing to its adventurous and dangerous nature, it brought him prominently before the public. As a result of this trip there was organized a second exploring party to accumulate geographic and geological data, as well as to study the Indians. Major Powell directed this work in the field for about ten years. Since there were similar expeditions in the same field, it was urged by Powell that they be united into one organization forming a bureau under the control of the Department of the Interior. This (1879) marked the beginning of the United States Geological Survey, and also of the Bureau of Ethnology, of which Major Powell was appointed director, a position he held until his death, serving also as the director of the Geological Survey from 1881 until 1894. To his great industry and energy these two bureaus owe much of their present efficiency, and the geographical work of the Geological Survey, together with its studies on irrigation, was largely due to his efforts. He not only set the standards for the new bureau, but trained its workers and put the study of the Indians on a high scientific plane, which has since been maintained by American ethnologists. His interest in ethnology led him into the broader field of anthropology, and he was for many years the president of the Anthropological Society of Washington. In the realms of psychology and philosophy Major Powell was also a student, and the latter part of his life was devoted to this study, a work on *Truth and Error* being published in 1899, which was followed by a series of essays entitled *Good and Evil*, which appeared in *The American Anthropologist*. Few scientific men in the United States have been as catholic in their tastes and have succeeded in as many different fields as Major Powell. In each of the several fields he made valuable contributions, while as an advocate of reforms in the land laws affecting the development and irrigation of the arid lands of the west, his efforts have had their effect on legislation. Some of his publications are: *Exploration of the Colorado River* (1875), *Report on the Geology of the Uinta Mountains* (1876), *Introduction to the Study of Indian Languages* (1880), *Studies in Sociology* (1887).

PRECIOUS STONES. See GEMS.

PRESBYTERIAN CHURCH IN THE UNITED STATES OF AMERICA, as an organization, dates from 1706, when the first presbytery was formed. The general synod was established eleven years later, and in 1789 the first general assembly met in Philadelphia. The church now comprises 32 synods and 233 presbyteries, with 1,045,338 communicants and 1,063,683 Sunday school members. There are 7617 ministers, and 7748 churches whose benevolent offerings for the last year aggregated \$4,419,809. Contributions for all purposes amounted to \$17,080,191, the chief items being: Home missions, \$1,203,453; foreign missions, \$898,079; education, \$105,301; Sunday-school work, \$136,757; church erection, \$261,034; relief fund, \$107,718; freedmen's missions, \$145,611; aid for colleges, \$125,421; congregational purposes, \$12,575,456. Home missionary work is conducted throughout the United States and in Alaska, Porto Rico and Cuba, and 1350 missionaries and 490 missionary teachers are employed. There are mission schools among the Indians, Alaskans, Mormons, Mexicans, the mountaineers, and the people of Porto Rico and Cuba. The missions for freedmen, which are carried on by a separate board established in 1865, now embrace 353 churches and mission stations, having 21,341 communicants and 21,299 Sunday-school scholars. Boarding schools, 18 in number, including Biddle University at Charlotte, N. C., are maintained as a part of this work; also 88 day schools, which are attended by some 11,000 pupils. Statistics for the foreign field show 27 missions, 121 stations, 1286 out-stations, with 750 missionaries and 1882 native helpers; 610 churches and 41,443 communicants. Educational and medical work also has a prominent place in this department. The receipts in the past year have raised the amount of the twentieth century fund to \$7,578,943.

The 114th general assembly, held in New York City, beginning May 15, 1902, was characterized by an action that has been termed one of the most important events in the history of American Presbyterianism, namely, the revision of the Westminster confession of faith. Dr. Henry Van Dyke, of Princeton, N. J., was elected moderator of the general assembly. Resolutions on the subject of divorce, and the appointment of a committee to confer with other denominations, some changes in the constitution, with the addition of a new chapter on organizations of the church, and the celebration of the centennial of the organized work of home missions, were among other matters that occupied the attention of the assembly. The report of the committee on creed revision was adopted by a practically unanimous vote. Its work, as defined by the last general assembly, consisted in preparing (1) a brief, clear, and untechnical statement of the principal doctrines of Presbyterian faith as a supplement to, but not as a substitute for, the Westminster confession; in preparing (2) amendments to specified sections of the confession "either by modification of the text or by declaratory statement," with additional chapters on the Holy Spirit, the love of God, and missions. This Brief Statement of the Reformed Faith, as approved by the general assembly, comprises sixteen articles: On God, revelation, the eternal purpose, the creation, the sin of man, the grace of God, election, our Lord Jesus Christ, faith and repentance, the Holy Spirit, the new birth and the new life, the resurrection and the life to come, the law of God, the church and the sacraments, the last judgment, and Christian service and the final triumph. It was adopted "with the view to inform and enlighten the people in regard to the significance and religious meaning of the reformed faith, and not with the view of becoming a test of orthodoxy for ministers, elders, and deacons."

The revision of the confession of faith provides for a declaratory statement on chapter iii. and chapter x., section 3, dealing respectively with the doctrines of predestination and of infant damnation. This declaratory statement repudiates the doctrine of infant damnation and holds that the doctrine of predestination is in harmony with God's love for all mankind, and "that no man is condemned except on the ground of his sin." Section 7 of chapter xvi., beginning "works done by unregenerate men" is changed in wording; and the last sentence of chapter xxii., section 3, treating of "lawful oaths and vows," is struck out. Section 6, chapter xxv., which contained the aspersions upon the Pope, now reads: "The Lord Jesus Christ is the only head of the Church, and the claim of any man to be the vicar of Christ and the head of the Church is unscriptural, without warrant in fact; and is a usurpation dishonoring to the Lord Jesus Christ." Besides the declaratory statement and amendments, two additional chapters, to be numbered xxxiv. and xxxv., were adopted on the "Holy Spirit" and on the "Love of God and Missions." It has been reported that creed revision is assured since the presbyteries generally are recording their approval of the overtures submitting these changes. The general assembly in 1903 will meet, May 21, in Los Angeles, Cal. Stated Clerk, Rev. William H. Roberts, D.D., LL.D., 1319 Walnut Street, Philadelphia.

PRESBYTERIAN CHURCH IN THE UNITED STATES, SOUTH, was established in 1864 by the union of two bodies that had previously withdrawn from the Presbyterian Church owing to differences on the slavery question. It has (1902) 13 synods and 79 presbyteries; 1501 ministers, 3017 churches, and 229,642 communi-

cants; and 2581 Sunday schools with 20,808 officers and teachers, and 151,364 scholars. The total contributions for the year were \$2,227,649, the principal amounts being: For home missions, \$161,614; for foreign missions, \$131,756; for education, \$132,521; for pastors' salaries, \$820,193; for congregational purposes, \$807,383. In Jackson, Miss., beginning May 15, was held the forty-second general assembly of the church. Several overtures came before the meeting on the subject of infant salvation, in answer to which was adopted an amended report which reads partly as follows: "This assembly is fully persuaded that the language employed in chapter x., section 3, of our confession of faith, touching infants dying in infancy, does not teach that there are any infants dying in infancy who are damned." The question of organic union with the Dutch Reformed Church also was introduced, but no final action was taken, it being deemed inadvisable until the desire of the two churches should be more definitely known. The report from the home mission field was encouraging, the board having closed the year without debt. The entire number of ministers and teachers supported was 132, and the number of churches aided, 325. The work of colored evangelization is progressing, the statistics for this department showing 53 ministers, 86 churches, and 2204 communicants. In the foreign missions of the church—Africa, Brazil, China, Cuba, Japan, Corea, and Mexico—there are 33 organized churches, having 4664 members, 191 out-stations, and 165 missionaries and 132 native helpers. One of the features of the year 1902 was the beginning in the Southern Presbyterian Church of the movement on the part of local churches to provide for the support of an individual missionary in the foreign field. The receipts, in contributions and subscriptions, for the twentieth century fund this year reached an aggregate of \$423,000, which, however, is but a fourth of the whole sum, the various synods having undertaken to raise \$1,720,000. The general assembly in 1903 will meet in Lexington, Va. Moderator, Rev. W. T. Hall, D.D.; stated clerk, Rev. William A. Alexander, D.D., Clarksville, Tenn.

PRESBYTERIANS, REFORMED. See REFORMED PRESBYTERIANS.

PREVENTION OF CRUELTY TO ANIMALS, AMERICAN SOCIETY FOR THE. The thirty-seventh annual report of the transactions of the society for the year 1902 shows that there were 53,093 cases of cruelty to animals investigated during the year, with the result that there were 520 arrests and prosecutions; 4339 animals suspended from labor; 3804 horses and other large animals, disabled beyond recovery, destroyed; 90,794 small and homeless animals were also destroyed; 509 disabled horses and other large animals removed from the streets in ambulances. The income for the year was \$143,416.39, of which \$48,752.46 was in the shape of bequests. The expenditure was \$145,140, and the balance in the treasury at the close of 1902 was \$550.95. The society has placed itself on record as opposed to vivisection. President, John P. Haines; secretary and treasurer, John Mason Knox, Madison Avenue and Twenty-sixth Street, New York.

PREVENTION OF CRUELTY TO CHILDREN, NEW YORK SOCIETY FOR THE, reports, as the work of the year 1902, having received and investigated 8938 complaints, with the result that 3371 offenders against the law were prosecuted, of which number 2838 were convicted. There were 6574 children rescued from destitution and vicious surroundings; and 5769 children received food and clothing at the reception rooms of the society during the year. At the request of city magistrates there were 431 cases investigated and properly disposed of. President, John D. Lindsay; secretary and superintendent, E. Fellows Jenkins, United Charities Building, New York.

PRICES. For the years 1901 and 1902 the index number of *Dun's Review*, which is based on wholesale prices of 350 commodities weighted according to importance, gives the following results (the values stated are proportional, serving the purpose of percentages).

1901	Bread-stuffs.	Meats.	Dairy and Garden.	Other Food.	Clothing.	Metals.	Miscellaneous.	Total.
January 1.....	\$14,486	\$8,407	\$15,556	\$9,504	\$16,024	\$15,810	\$15,881	\$95,668

1903									
January 1.....	17,104	9,522	14,613	9,418	15,938	17,185	16,578	100,356	1.2

From these tables we see that the prices of breadstuffs rose steadily through 1901 until January, 1902, remained nearly constant until August, and then suddenly fell when the early wheat and corn crops began to come to market. Prices of meats rose steadily and rapidly, reaching the highest point in August, 1902, and then declined. Dairy and garden products fluctuated greatly in price, because of seasonal changes, but on the whole declined during these two years. A distinct decline is noticeable in other foodstuffs. Both clothing and metals rose somewhat, while the prices of miscellaneous articles included in the tables remained practically stationary after the slight rise at the beginning of 1901. A comparison of the totals shows a decided upward movement of prices through 1901, and a remarkably steady high-price level throughout 1902. This high-price level is explained by the short wheat and corn crops in 1901, causing the rise in price of breadstuffs; the scarcity of live stock explains the high price of meat. The advance in the prices of clothing and metals was due to heavy demand and advance in the prices of raw materials. A comparison of the average price levels of the two years shows that prices were on the average 4.7 per cent. higher in 1902 than in 1901. The slight decline in prices during December is remarkable, since the advancing season produced a higher price level in every preceding year. It may be doubted whether the index number gives sufficient weight to the advance in the price of coal, which at this season of the year is a prime necessity, the dearth of which caused great suffering. Besides wholesale prices never indicate the real advance in the cost of living, for the advance in retail prices is invariably greater in proportion than the advance in wholesale prices.

PRIMITIVE METHODIST CHURCH OF AMERICA, a denomination which was introduced into the United States from Canada, having been instituted in England by Wesleyan Methodists who advocated camp meetings as one of the religious activities of that church. It now has 6520 members, 72 ministers, and 100 churches, with property valued at \$279,843; and 94 Sunday schools attended by 11,368 scholars. The most noteworthy event in the history of 1902 was the approach toward union between the Methodist Protestant and the Primitive Methodist churches, a basis for federation having been decided upon at a meeting of committees from both denominations, held in the early part of August in New York City. The overtures were made by the Methodist Protestant Church through Dr. D. S. Stephens, the president of its general conference; and the proposed terms of union soon will be laid before the two churches for a decisive vote. The Primitive Methodists maintain a publishing house in Fall River, Mass., and are represented officially by the *Primitive Methodist Journal*. The next general conference of the church will meet in 1905, at Newcastle, Pa.

PRINCE EDWARD ISLAND, a province of the Dominion of Canada, with an area of 2000 square miles, and a population, according to the census of 1901 of 103,259 as against 109,078 in 1891. Capital, Charlottetown; population, 12,080 in 1901. The number of public schools in 1901 was 474, with a total enrollment of 20,779, as compared with 21,289 in 1900. The total expenditure for education in 1901 was \$164,935.

Government, Industries, and Finance.—The province is administered by a lieutenant-governor, assisted by a responsible ministry. The legislative assembly has 30 members, elected by a popular vote. The province is represented by 4 members in the Dominion senate, and 4 in the House of Commons. The revenue and expenditure for 1901 were \$309,445 and \$335,632, respectively. The total liabili-

ties of the province on December 31, 1901, were \$642,177. The trade for the fiscal year 1902 was an increase as compared with 1901, the exports being \$801,013 as compared with \$681,403 for 1901, and the imports \$643,829, as compared with \$526,617 for 1901. Much excitement was caused in June by what was supposed to be a sulphur shower on the island. All the pools, ponds, and rivers were covered. At first it was believed that the yellow dust had been carried from Martinique or St. Vincent after the volcanic eruption, but London papers, reporting similar showers in England in June, declared that microscopical examination showed the dust to be pollen of pine trees. Much dissatisfaction was expressed, notably by Hon. Arthur Peters, premier, over the reduction of the island's representation from 5 to 4 in the Dominion House of Commons. This was caused by the decrease in population and the provisions of the British North America Act applying thereto.

PRINCETON UNIVERSITY, founded 1746 at Princeton, N. J. At the commencement season in June, President Francis L. Patton resigned, to the great surprise of students and all friends of the university. Dr. Patton graduated from Princeton in 1865, and became president in 1888, after an incumbency of seven years in the chair of philosophy at Princeton Seminary. He resigned to resume the work of teaching in the seminary, and also to continue his religious and theological writings. Dr. Woodrow Wilson, professor of jurisprudence and political economy since 1891, was immediately elected to the presidency. President Wilson graduated at Princeton in 1875, and during his professorship has been very popular with the students. He is the first layman to be elected to the presidency of the university. On October 25 President Wilson was inaugurated, delivering an address on the "New Humanism" which attracted much favorable comment. While it is too soon after the change in administration to announce any change in policy, the institution has signified its adherence to the old collegiate course and to the policy of university expansion. No notable additions to the university funds were made during the year. One new building, Little Hall, has been added to its physical equipment. The more important additions to the teaching staff are as follows: George Stevenson Patten, professor of moral philosophy; Howard Crosby Warren, professor of experimental psychology; Edmund Yard Robbins, professor of Latin; Thomas Marc Parrott, professor of physics. The teaching staff now numbers 101. The student registration was 1354, divided as follows: College, 760; school of science, 477; graduate school, 117. The registration in November for the year 1902-03 was 1345.

PRIVATE BANKS. The following table, prepared from reports made by the comptroller of the currency, approximating to June 30, gives statistics of the total number of private banks in 1901 and 1902:

PROTESTANT EPISCOPAL CHURCH, a member of the Anglican communion, traces its descent through colonial churches to the Church of England. It now comprises 60 dioceses and 21 missionary districts within the United States and its possessions, besides missionary districts in foreign lands. There are 91 bishops of the church, 9 having been consecrated in the year 1902: Frederick W. Keator, D.D., of Olympia; Frederick Burgess, D.D., of Long Island; James A. Ingle, of Hankow, China; Alexander H. Vinton, D.D., of Western Massachusetts; Alexander Mackay-Smith, D.D., coadjutor-bishop of Pennsylvania; Charles S. Olmsted, D.D., of Colorado; James H. Van Buren, D.D., of Porto Rico; Henry B. Restarick, of Honolulu; and Charles T. Olmsted, D.D., bishop coadjutor of central New York. Charles M. Beckwith, D.D., and Sheldon M. Griswold, D.D., were elected bishops of Alabama and Salina, respectively. Notable losses in the episcopate were sustained in the deaths of Bishops Robert W. Barnwell, D.D., of Alabama; John F. Spalding, D.D., of Colorado; Hugh M. Thompson, D.D., LL.D., of Mississippi, and Francis M. Whittle, D.D., LL.D., of Virginia. Rt. Rev. Robert A. Gibson, D.D., succeeded Bishop Whittle in the diocese of Virginia. The Protestant Episcopal Church has 6793 parishes and missions, 6062 church edifices, and 756,765 communicants. The clergy number 4950. In the Sunday schools are enrolled 47,309 teachers and 430,961 scholars. Total contributions for 1902 were \$15,043,586. The diocese of Honolulu was transferred from the care of the Anglican Church to the American Church, Bishop Willis having finally presented his resignation, to take effect April 1, 1902. When Hawaii was annexed to the United States, it seemed natural that the Episcopal Church should pass to the jurisdiction of the Protestant Episcopal Church, but the Anglican bishop protested against the transfer, and it was only after a conference at the last general convention (1901) that Bishop Willis consented to resign. A significant movement during the year 1902 was that toward union, on the basis of the Lambeth quadrilateral, between the Episcopal and Polish Old Catholic churches. Bishop Anthony Kozlowski, of the latter, representing a body of 42,850 communicants, with 43 churches and 33 ministers, applied for recognition, and a committee on terms of intercommunion was appointed by the house of bishops. Missionary activities, too, occupied a prominent place in the history of the year. The apportionment plan that was tried resulted in an increase in receipts of \$100,000. It was proposed to raise \$1,000,000 for work in the Philippines, the movement being in behalf of educational and other improvement, as well as on denominational lines. Liberal contributions already have been received. A largely attended missionary council was held in Philadelphia in October; and the Advent season in New York City and vicinity was marked by a noteworthy series of revivals in the interests of foreign missions.

The twenty-first church congress in Albany (October) was devoted to a discussion of various topics on the relation of Christianity to social life. Other matters of interest during 1902 were the discussions on the advance of ritualism in the church, and on the change of its legal name. Besides the deaths in the episcopate, that of Eugene A. Hoffman, D.D., D.C.L., dean of the General Theological Seminary, was a great loss to the church. The next general convention (1904) will be held in Boston.

PRUSSIA, a kingdom constituting the largest and most important state of the German empire. See GERMANY.

PSYCHICAL RESEARCH, SOCIETY FOR, founded in England in 1882 for the study of supernormal psychical and physical phenomena, had in 1902 about 900 members. The president was Oliver Lodge, LL.D., F.R.S. There is an American branch of the society, founded in 1895, having in 1902 about 500 members. Secretary of the English society, J. G. Piddington, Esq., 87 Sloan Street, London, S.W.; secretary of the American branch, Dr. Richard Hodgson, 5 Boylston Place, Boston, Mass. The society publishes *Proceedings* (parts xliii. and xlv. in 1902), and a monthly *Journal*. Part xliii. of the *Proceedings* contains the address of the president, Dr. Lodge, discussing general questions of trance lucidity and clairvoyance with the strange physical phenomena that sometimes accompany trance. He insists that while the telepathic hypothesis of trance phenomena is based upon well recognized facts of telepathy, it fails to account for all the facts revealed in trances, and that while there is yet no universally accepted proof that disembodied spirits exist and communicate with living persons, there is yet no *a priori* reason why such a thing is impossible. Dr. Lodge approves of the conception of the subliminal consciousness introduced into psychology by the late F. W. H. Myers in its present form. Part xlv. of the *Proceedings* contains a number of reports upon the trances of Mrs. Thompson, an English medium. They are here first published and are by Dr. F. van Eeden, the Dutch psychologist (seven sittings); by J. O. Wilson (pseudonym) (two sittings); by Dr. Richard Hodgson, secretary of the American branch of the society, who conducted the sittings with the American medium, Mrs. Leonora Piper (six sittings), and by Mrs. A. W. Verrall (twenty-two sittings).

Mrs. Thompson is an English lady, the wife of Edmond Thompson, of Hampstead, London, N. W. From early youth she has observed in herself unusual psychical phenomena, although it was not until 1896 that she realized her power of exhibiting the peculiar manifestations of the trance medium. She is described as a woman in other respects entirely normal, "an active, vigorous and practical person, interested in her household and in her children, and in the ordinary amusements of young English ladies, as bicycling and the theatre. She is not of morbid nor even of specially reflective or religious temperament. No one would think of her as the possessor of supernormal gifts." Unlike the American medium, Mrs. Piper, in whose case a large proportion of the communications are written, it is stated that she sees spirits life size, hears voices, sees words (printed), sees visions in crystal balls, sometimes writes automatically even in the waking state; the customary mode of communication in her case, however, being by means of speech in trance. Since 1898, under the direction of the late F. W. H. Myers and J. G. Piddington, secretary of the English society, she has given repeated evidences of an extraordinary knowledge of events known in some cases only to the so-called sitter. The Society for Psychical Research in 1902 began circulation of a questionnaire as to the "Human Sentiment with Regard to a Future Life." The questions are as follows: I. Would you prefer (a) to live after death, or (b) not? II. (a) If I. (a) do you desire a future life whatever the conditions might be? (b) If not, what would have to be its character to make the prospect seem tolerable? Would you not, e.g. be content with a life more or less like your present life? (c) Can you say what elements in life, if any, are felt by you to call for its perpetuity? III. Can you state *why* you feel in this way, as regards I. and II.? IV. Do you now feel the question of a future life to be of urgent importance to your mental comfort? V. Have your feelings on questions I., II., and IV. undergone change? If so, when and in what ways? VI. (a) Would you like to know for certain about the future life, or (b) would you prefer to leave it a matter of faith?

PSYCHOLOGICAL ASSOCIATION, AMERICAN, a society of psychologists, founded in 1892, had, in 1902, a membership of 135. President in 1902, Prof. E. C. Sanford, of Clark University; secretary, Dr. Livingston Farrand, of Columbia. The meeting for 1902 was held at Washington, D. C., December 30, 1902, to January 1, 1903. The society is affiliated with the American Association for the Advancement of Science, and is represented by a delegate in that body. The society through a committee commenced in 1902 the compilation of a psychological bibliography. The following papers were read: *Psychology and Physics*, by Prof. E. C. Sanford of Clark University; *The Psychology of Weather Influence*, by Edwin G. Dexter, in which he showed that children are more influenced by the weather than adults, and that women are more affected by meteorological conditions than are men; *The Development of Memory in School Children*, in which the author reported that the memory for colors on the part of the children studied by him was the best developed, and that next in order came concrete words, then words arousing imagery of the sense of touch, then emotion words; *The Position of Psychology in the System of Knowledge*, by Prof. Hugo Münsterberg of Harvard, and other papers of more technical nature. Prof. William L. Bryan of Indiana University was elected president for 1903.

PSYCHOLOGY, EXPERIMENTAL. "A psychological experiment consists of an introspection or a series of introspections made under standard conditions" (Titchener). For such standard conditions the instruments vary in complexity and cost from simple pencil and paper to the richly equipped laboratory with its intricate internal arrangement and its complicated electrical devices often invented and manufactured in the laboratory itself for a single experiment. Psychological experiments are now conducted, and their results published, at about thirty-five institutions of learning in the United States and Canada, of which the more prominent have been selected for special mention in the preceding volumes of the YEAR BOOK. In Europe much is being done in the different lines of research in Germany, France, Switzerland, and Italy, though comparatively little in England. Of the results of work in experimental psychology published in 1902 the below-mentioned are selected as being of general practical interest. Other researches of importance are those of Schmidt on association and Wiersma on the fluctuation of the attention (both in the *Zeitschrift für Psychologie*, vol. xxviii.). Laboratories in the United States not specially mentioned below, in which research work is done in psychology, are those of Bellevue Medical School, Brown University, Bryn Mawr College, Chicago University, Colorado University, Harvard University, Indiana University, Leland Stanford, Jr., University, McGill University, universities of Minnesota and Missouri, Mt. Holyoke College, University of Nebraska, New York University, University of Pennsylvania, Princeton University, Psychopathological Laboratory of New York City, Smith College, Toronto University, United States Bureau of Education, Vassar College,

Wellesley College, Wells College, Wesleyan University, and the University of Wisconsin.

Dr. Sante de Sanctis and Dr. U. Neyroz, of the University of Rome, investigated, by means of sensations of touch, the depth of sleep of four normal and five abnormal persons of different ages. The experiments were carried on for six months, one or two a night, but at different hours on successive nights for the same subject. Many hundreds of tests were taken, the experimenter entering with a dark lantern and placing the blunt points of an æsthesiometer upon the upper left part of the forehead. The time of the first unconscious movement of the sleeper was noted and the time at which, after being pressed with increasing intensity, he finally awoke, and thus it was possible to tell just when the sleep is deepest. A record was kept also of the occurrence of dreams. The results of these experiments may be summed up as follows: Sleep is deepest, both for normal and for abnormal persons in the first half of the second hour of sleep, when it becomes lighter until a greater depth is again reached; though in the normal subjects not so great as the first depth. With all of the pathological subjects the depth of sleep is far greater than with the normal subjects. In two abnormal subjects the depth was as much as twice that of normal subjects, i.e. it took twice as much pressure on the æsthesiometer to waken them thoroughly. It was found that sleep was the deepest in the oldest epileptic and the one who had been longest an invalid. There is a much greater uniformity in the depth of sleep among the normal than in the abnormal subjects. Dreams occur in every period of sleep, but they are more frequent and more vivid in the later hours of the night, particularly towards morning. The modifying influence of external stimuli on the course of dreams was several times noted.

M. Ch. Féré presents a study in the *Année Psychologique* on the *Influence of Rhythm on Work*. He used Mosso's ergograph, raising a weight of three kilograms with each contraction. He found that the movements of the middle finger, with which the work is done on the Mosso ergograph, were excited to greater amplitude and force if the subject heard at the instant he contracted his muscles the blow of a hammer upon a table or the tone of a triangle. This, however, hastened the fatigue. Working slowly increases the amount of work done, and gradually decreasing the speed of the contractions increases the amount of work done in proportion to the amount of the decrease. Thus, contracting the middle finger of the right hand every second and then, after ten contractions, doing it only thirty times a minute, gives an appreciably greater amount of work than going from ten contractions at the rate of sixty a minute to contractions at the rate of fifty a minute. A change of rhythm produces a slight depression in the amount of work done by the right hand, but a much greater depression in the amount done by the left hand. Grouping the movements with pauses at rhythmical intervals seems to help the attention and increase the work done to a degree sometimes more than making up for the loss of time. Other experiments, on the alternation of right and left hand work, combined with visual stimuli, were such as to show the reality of the so-called cross education of the cerebral hemispheres.

M. V. Henri in an article in the *Année Psychologique* reviews a great number of researches on memory published by psychologists in Europe and America and deduces the general law that the memory of any complex impression is the better the greater the number of partial memories brought into play by this impression. "Partial memories" is used for associated presentations, in other sense elements, accompanying the main or typical memory image. For instance, when we use the word "bell" we may mentally see the bell with a definite shape and color, or we may mentally hear the bell, or we may mentally touch it. Any one of these forms of the idea may be uppermost in our minds at any one time, and at that time the others, if present, would constitute the partial memories. M. Henri states the following two problems, among others, not yet solved: (1) Is it possible to discover in the case of any given subject just what partial memories are below the normal in development, and what are above, and (2) can these partial memories be effectively trained?

Clark University.—Mr. A. J. Kinnaman reports a research upon the *Mental Life of Rhesus Monkeys in Captivity*. He experimented with two monkeys, a male and a female, of the *Maccus Rhesus* variety from India. They were chosen partly for the reason that they are somewhat familiarized with human environment, being the sacred monkey of India, protected by the superstitions of the country. The experiments consisted in putting food into a small box (11x13x15 inches) with a door having a spring which caused it to fly open when unfastened. Seventeen different kinds of fastenings were used—as hook, latch, bolt, button, etc.—the manipulation of all of which was learned by the monkeys. Experiments were also made to see whether the monkeys would learn to form associations between certain arbitrary signs and the getting of food. Food was presented to them in receptacles of different shapes of the same capacity, and again of the same shape, but of different capacities.

At other times, receptacles of different colors, and shades of the same color were used. These tests showed that monkeys can perceive colors, and that two colors of a given difference of brightness are discriminated better than two grays of an equal difference of brightness and that differences of form and size are perceived. Mr. Kinnaman is not willing to believe that the monkeys reasoned in the higher sense of the term but have learned each task only after repeated failures and the gradual elimination of useless efforts. The female learned by imitating the male, where she failed to learn otherwise. They did, however, show an increasing ability to pick out the fastenings as the essential difficulty in opening the box. A curious and interesting test was made upon the monkeys for color preferences. They were placed one at a time in a cage which had before it sheets of colored gelatine; orange and blue sunlight was admitted through these sheets. The male spent 62 per cent. of his time in the blue light, while the female spent the larger part of hers in the orange.

Mr. Chas. H. Sears contributes a study on the psychology of rhythm of interest to musicians. He measured the records of the absolute times taken up by the notes of five hymns which were played by four church organists upon a reed organ. He found variations in the times consumed by the different musicians and by the same musician playing the same tune on different occasions. Thus, one tune was played by one organist in 23.57 seconds while it took another 31.33 seconds to play the same succession of notes. It is naturally inferrable from this that the individual measures varied in duration, and this was found to be the case. This individual difference is not, however, so important or so striking as that between the lengths of note of the same kind when played by the same musician in the same piece of music or even in the same measure. Thus, one organist produced half notes varying in duration from .66 to .83 second. The quarter notes did not measure half the length of the half notes, and other variations were noticed in notes of other values, e.g., sixteenth notes varied in length from .10 to .16 second. This irregularity has been previously recorded in the case of eminent musicians whose performances were minutely studied by Binet and Courtier. From his experiments, which have not before been published, Mr. Sears finds: There is a tendency to play a selection more slowly a second time than the first. The irregularity in length of measures does not in the selections used by him average more than .1 second. A marked tendency was observed in the direction of lengthening notes upon which the musical accent falls. In some cases, though the musicians were playing in what is known as the *legato* style, there was an interval between two successive tones even when they were on different degrees of the scale. The interval is usually the result of the shortening of the preceding tone. When successive notes are on different degrees of the scale there is frequently an overlapping, i.e., the later tone begins before the earlier has stopped. These overlappings show great variations in length, and that independently of the absolute duration of the tone. Thus, a very short note may overlap its predecessor and itself be overlapped by its successor to such a degree that it sounds alone for only one-fifth of its total length, without destroying the æsthetic effect of the music. These results are true both when the air or soprano voice of the selection is played alone, and when all parts are played. In the latter case, however, Mr. Sears's results do not corroborate the statement of a German psychologist, Meumann, who suggested that when a performer uses both hands the one helps the other to achieve a greater regularity and correctness in rhythm. An interesting fact was noted by Mr. Sears in that the notes of a Swiss music box, when accurately measured showed variations in the absolute time of notes of the same denomination.

Columbia University.—Mr. J. Hershey Bair, from the results of experiments upon learning arbitrary series of reactions upon a typewriter and from other motor mental activities, deduces the following conclusions (*The Practice Curve*, Monograph supplement of *Psychological Review*, No. 19, November, 1902): In practicing a series of responses with a series of stimuli until they become automatic, when the time is kept constant by means of a metronome the decrease in the number of errors follows the law of the practice curve. The greater the number of possible reactions the slower the rate of adjustment and the later the time at which no errors will be made. There are less errors made and it takes fewer practices to eliminate them at the slower rates than at the faster. This last statement is of much interest with regard to the teaching of music, for it gives scientific proof of a theory for some time held by instructors that it is better to practice a piece of music at a slow tempo. Mr. Bair's results showed also that when one series of reactions has been learned perfectly, so that it can be performed without error, a new series can be learned in a shorter time than was the first. Mr. Bair interprets his results as proving that special training increases general ability, a doctrine which has been a subject of some controversy in psychology.

Cornell University.—Miss Florence W. Bagley made a study of the so-called Fechner's Colors, an interesting and peculiar visual phenomenon. If the eye be

stimulated by black and white surfaces in alternation, at such a rate that there is a flickering, there results a sensation of color, blue, green, yellow, and red according to the quantity and shape of the black and white surfaces used.

Miss Bagley devised a large number of disks which were rotated for her studies at a rate of 4.3 times a second. The disk shown in the cut is an example of one type of the ninety-eight different disks used. Thirty-eight were black and white; the others had colored backgrounds instead of white. A curious fact about the phenomenon is that if the disk is rotated in the direction that produces red in the centre and blue near the circumference, the relative positions of these colors change place when the disk is rotated in the opposite direction. Helmholtz explained the phenomenon on the assumption that different rates of excitation of the retina produce different colors and that a certain amount of fatigue was necessary for the perception of the colors—an ex-

planation, however, that seems inconsistent with the facts as observed in these experiments.

University of California.—Prof. George M. Stratton contributes two studies on *Visible Motion and the Space Threshold*. The “threshold” is the least noticeable difference between two sensations of like kind; in touch and sight it is that point where two stimuli are so near in space or time as to be perceived as but one. It has long been known, however, that a very slight motion of objects below the threshold will cause them to be at once discriminated. This fact was taken by James (*Principles of Psychology*, vol. ii., p. 172) as a proof that movement is a primitive form of sensibility and that the sense of movement cannot be derived from the sense of position. Professor Stratton’s experiment was concerned with the evidence for this position, using lights as stimuli for indirect vision and a white line for direct vision. In the experiment upon direct vision it was necessary to avoid the difficulties in the measurement of very small angles encountered by previous experimenters who had been obliged to use a microscope, and for this purpose he placed his subject at a distance of nearly 400 feet from the stimulus. It was then possible for the subject to use the naked eye, as a line of the length used, 50 centimetres (about 19½ inches), subtends at this distance an angle of about 18’ of arc, a little more than a quarter of a degree; and it was possible to measure accurately motions of an amplitude so small as 5’ of arc. Both sets of experiments—upon direct and upon indirect vision—agree in showing that “the doctrine that visual motion is a primitive form of sensibility independent of local discrimination finds no experimental warrant. The perception of motion seems to be nothing more nor less than the perception that a sensation is changing its space relations, the motion itself furnishing a decidedly favorable, but by no means unique set of conditions for appreciating such differences of space relationship.”

Miss Alice Robertson at the University of California made a number of experiments on “Geometric-Optical Illusions in Touch.” She used among others the Müller-Lyer figure (a straight line with angles at the ends) and the Poggendorf

MÜLLER-LYER FIGURE.

POGGENDORF FIGURE.

figure (parallel lines intersected by another at an acute angle, the part between the parallels being taken away). Her experiments consisted in passing the finger tips lightly over a pasteboard on which the different figures had been placed in raised lines, and she found that the Müller-Lyer figure produced the same illusion in the

sense of touch that it has for the sense of sight, even with people who have never seen the figure; but the Poggendorf figure created in the sense of touch a false idea, of a nature opposite to that caused by the figure when seen. Thus in the Poggendorf figure, when the parallels are vertical and the oblique line goes from the right hand upper down to the left hand lower corner of the figure, the part of the line to the right of the parallels is always thought to be too high up to be in the same straight line with the other part of the intersecting line. But when the figure is made with lines slightly raised so as to be perceptible to the sense of touch at the finger tips, the right hand part of the line seems too low. No explanation is given for this tactual reversal of the optical illusion, but it is taken as a proof that the current explanations of the visual illusion with the same figure are invalid.

At the University of California Miss M. L. Nelson studied the "Effect of Subdivisions on the Visual Estimate of Time" (*Psychological Review*, September, 1902). Mental estimates of small intervals of time vary according to the character of the stimuli—touch, sight, or hearing—giving the test period (as when a tap on the hand or a click marks the beginning of the period and another its end); and they also vary according to (i.e. mentally measure another of the same duration) whether or not the stimuli above mentioned are repeated at regular intervals during this period. The estimate is measured by the subject's ability to reduplicate the test period. Miss Nelson tried to find out what effect there would be on the mental estimate with visual stimulus—a flash of light—when the time limited by these flashes was "filled" by flashes of the same nature at regular intervals. The results showed that an empty time interval used as a standard seemed shorter than the time filled by regularly repeated flashes and that the filled time seemed longer the greater was the number of flashes contained.

University of Chicago.—Mr. J. Haywood Pearce, at the University of Chicago, conducted a research upon "Normal Motor Suggestibility" (*Psychological Review*, July, 1902). Mr. Pearce's experiments were made with tactual, auditory, and visual stimuli, their common principle being a demand upon the subject to localize either the place or direction of the given stimulus in a set field. Variations in the spatial relations of like stimuli were the basis of the suggestion, and Mr. Pearce's conclusions are based upon certain peculiar tendencies to follow or contradict these variations in the subject's response. He states them as follows:

"(1) In localizing a single stimulus whether tactual, inauditory, or visual, an error is ordinarily made in the direction of the point upon which attention is directed when the stimulus is given. This error notably increases with the distance of the stimulus from the point of attention. (2) When a second stimulus of like character to the first is given there is at first manifest a tendency to resist the suggestion thereby offered. But this tendency is diminished as the suggestion is repeated, and ultimately the suggestion becomes fully effective, causing the subject to err in the direction of the second stimulus. (3) The resistance or the contradictory tendency is most vigorous when the suggestion is made in a direction opposed to the normal tendency to error; but ultimately a suggestion opposed to a normal tendency is more effective than in the reverse case. (4) Variation of intensity and distance of second stimulus within certain limits is followed by a corresponding variation in effect produced. The first effect, however, of any change in the method is to produce vacillating and contradictory results."

University of Cincinnati.—Prof. Chas. H. Judd of the University of Cincinnati, made a series of measurements of the varying degrees (diminishing according to practice) of the visual illusion caused by the so-called Müller-Lyer figure. Professor Judd took a card with that form of the Müller-Lyer figure on the edge of it which has the angles pointing away from each other. On another card he had a

(between the two angles that point away from each other) is about two inches long, the portion of the line of indefinite length that is thought to be equal to the other will be found to be more than a quarter of an inch shorter than the other. Professor Judd found that this illusion, after about 1000 attempts, disappeared. Professor Judd calls attention to the fact that the judgment, or thought in abstract

terms, about the illusion seems to have nothing to do with its final disappearance. He says: "If it is true that in a limited series of experiments a change so marked as this may take place without leaving in direct consciousness a single trace of the process by which the change was effected, then, certainly, we must hesitate in adopting any explanation of mental development which is based on the assumption that the later stages of mental life are different from the earlier stages only in a quantitative way. The whole genetic problem is seen to be a problem requiring methods which reach beyond introspection, and requiring, furthermore, a careful scrutiny of the qualitative aspects of the changes effected through development."

University of Iowa.—Prof. C. E. Seashore of the University of Iowa has invented an instrument called a tonoscope for rendering visible the sound vibrations of the human voice or other musical tone, and at the same time counting them. The instrument consists of a revolving drum, with rows of dots around the edge of it, each row in a different plane perpendicular to the axis.

TONOSCOPE.

they were closed the line of dots moved along a distance equal to a hundredth of the circumference of the drum, the motion of the dots could not be detected. In the instrument now being described the flashes of the Geissler tube take the place of this impossibly rapid opening and shutting of the eyes. The tuning fork also by the tone it makes, serves as a standard or model to be imitated by the singer. The tone of the singer is conveyed to the drum by a speaking tube, and, near the drum, is, as it were, translated into light by means of what is known as a manometric capsule. The capsule is constructed in such a way as to make a gas flame flicker once for every sound vibration of the tone sung into the speaking tube, making an effect similar to the flashes of the Geissler tube. Now, if the person hearing the tone of the fork can imitate it exactly, the tone he sings into the speaking tube will cause in a second of time 100 flickerings of the gas flame in the manometric capsule, which in turn will make the 100-dot line on the drum appear to stand still. The two flickering lights, that from the Geissler tube and that from the manometric capsule, are placed on opposite sides of the drum so as not to interfere with each other, the experimenter adjusts his fork to the tone he wishes, notes the number of vibrations as registered on the scale (shown in the cut only on the side where the capsule is) and then is ready to read the number of air vibrations made by the vocal cords of the singer. It may be noted here that if the number of vibrations is greater (e.g. 146) than the highest number on the scale (145) it will be twice (or four times, etc.) as great as some other number on the scale (e.g. 73) and 146 vibrations will make the line numbered 73 appear to stand still. It is thus seen that any line of dots on the drum may be made to look motionless by a tone of the corresponding number of vibrations or by its octave which has twice as many vibrations. The inventor of this instrument offers it as one that will be valuable in experimenting upon the motor side of mental phenomena, and points out that little work has been done in experimental psychology in the study of motor processes, particularly in the psychology of

The rows have different numbers of dots in them, from 73 to 145. When the drum revolves once a second, therefore, 73 or any number of dots up to 145, pass a given point in a second. The connection between these dots and a musical tone is as follows. A tuning fork is set in motion by an electro-magnet making, for example, 100 vibrations a second. The hundred backward and forward movements of this fork are used to break and make an electric current; and this hundred times broken current produces in a little instrument known to physics as a Geissler tube 100 flashes, which cause 100 separate illuminations of the drum, used in a dark room for this purpose. These flashes render the 100-dot line apparently stationary, the dots being seen clearly, while all the other lines of dots are blurred. This will be easily comprehended when it is reflected that if the eyes could be opened and shut 100 times a second and every time

music. Professor Seashore observes, as the results of preliminary experiments with the tonoscope, that sustained tones vary in pitch according to a general law, and that "there is a shocking surprise for every singer who tests his ability to sing even the simplest air in true pitch. He finds that his good ear has tolerated great license in the matter of fidelity to pitch" (*University of Iowa Studies in Psychology*, vol. iii., 1902).

University of Michigan.—From this university Mr. H. C. Stevens reported results of an investigation into the "Relation of the Fluctuations of the Judgments in the Estimation of Time Intervals to Vaso-Motor Waves" (*American Journal of Psychology*, January, 1902). It had been shown in 1900 that the fluctuation of attention was exactly paralleled by the so-called Traube-Hering vaso-motor waves. Mr. Stevens undertook by means of elaborate experiments extending over a long period of time to find the relation of the vaso-motor wave to the fluctuation of judgments of time intervals. His subjects were given at different stages in the experiments intervals of different lengths marked off by clicks of a Meumann time-sense machine. They then registered on a revolving drum, by means of a telegraph key, the beginning and end of an interval judged by them to be equal. Mr. Stevens found that with his six subjects, the shortest intervals (e.g. of four-tenths of a second) tend to be overestimated; intervals from seven-tenths of a second to two and four-tenths seconds are generally underestimated and that intervals from three and seven-tenths to seven and twenty-four-hundredths seconds are overestimated. He finds also that Weber's law does not hold for the estimation of time intervals, and that "there is no special time sense in consciousness; but our judgment of time is mediate, depending upon organic processes of which the changes in blood volume are one of the more important." He finds also that for intervals larger than three and seven-tenths seconds "the strain of respiration may afford to some subjects a means of estimating time intervals."

Yale University.—From the Yale psychological laboratory we have a study on the rhythm of speech by J. E. Wallace Wallin (New Haven, 1902). He investigated the qualities of human speech with the aid of a talking machine. A large number of persons read, recited, and sang into the machine, and the reproductions of their voices were studied by ear to determine the laws of emphasis and their operation in prose and poetry. It is necessary in an investigation of this kind to take into consideration three factors of the spoken word, the time or duration, the intensity or loudness of the sound and the pitch of the sound. The quality or timbre of the sound was not taken note of as it was assumed that the quality added little or nothing to the emphasis. All four factors are present in every tone, but it is impossible in the nature of the case to isolate any one of them. The emphasis of speech was regarded as a centroid or combination of forces in which, however, the pitch or the duration or the intensity may be the most noticeable of the factors. Accurate measurements may easily be made from the records of the talking machines of the actual duration of the words of any passage. From such measurements Mr. Wallin corroborated the statement that syllables emphasized by increase of intensity or loudness are generally of longer duration than the others. To determine the comparative force or intensity of the syllables, however, it is necessary to hear them and judge by ear alone whether they are louder or less loud than the others in a phrase, in a line, or in a sentence. Examination of the records of the phonograph when the cylinder revolves slowly showed that between successive syllables there are silences, which fact contradicts the statements of phoneticians who maintain that syllables are continuous. The ratio of the length of the silence to the length of the syllable averages one to two and one-third. That almost one-half of our spoken words is made up of silence is an apparent paradox. The duration of separate sounds and silences was measured with accuracy both for prose and for poetry, and the intervals, both expiration or sound intervals, and vacant intervals, were studied with the following results. "The quantity of the sounds of expiration intervals of speech is nearly $2\frac{1}{2}$ times greater than the quantity of the silences. The average emphatic and unemphatic syllables of speech are both uniformly longer than the average silences." The emphasis given to the different parts of speech was found to be in the following ratio. Nouns received the emphasis more frequently than any other part of speech. Then, in order of frequency, come verbs, adjectives, adverbs, conjunctions, prepositions, personal pronouns, proper nouns, and interjections. In poetry the average duration of the emphatic syllables was .19 second; while that of the unemphatic syllables was .11 second. A thorough discussion of the methods, previous researches, and results of study in the subject of spoken language is found in the large volume by Prof. E. W. Scripture, director of the Yale Psychological Laboratory, entitled *Experimental Phonetics* (New York, 1902).

Among the more important books on psychology as a whole or in part, that have appeared in 1902 in English, may be mentioned the following: Volume ii. of the *Dictionary of Philosophy and Psychology*, edited by J. Mark Baldwin; Oppenheim,

Mental Growth and Control; Baldwin, *Fragments in Philosophy and Science*; Witmer, *Analytical Psychology*; James, *Varieties of Religious Experience*; Baldwin, *Development and Evolution*; Scripture, *Elements of Experimental Phonetics*; Brooks, *The Elements of Mind*; Sturt, *Personal Idealism*; Spencer, *Facts and Comments*; Duff and Allen, *Psychic Research and Gospel Miracles*; Spiller, *The Mind of Man*; Savage, *Can Telepathy Explain?* Sully, *An Essay on Laughter*.

PYTHIAS, KNIGHTS OF, a fraternal organization founded at Washington, D. C., in 1864. There are 54 grand lodges in the order, including those in British Columbia, and a total membership of 540,138. There is an endowment rank, or life insurance branch, in which there is a membership of 59,211, representing an endowment of \$102,419,500. The conventions of the supreme lodge are held biennially, the last in San Francisco in August, 1902, and the next convention at Louisville, Ky., August, 1904, while the respective grand lodges hold their conventions independently, as may be agreed upon. Supreme chancellor, Tracy R. Bangs, Grand Forks, N. D.; supreme keeper of records and seal, R. L. C. White, Nashville, Tenn.

QUAKERS. See **FRIENDS, SOCIETY OF**.

QUEBEC, a province of the Dominion of Canada, has an area of 347,350 square miles. The population according to the census of 1901 was 1,648,898, against 1,488,535 in 1891—a larger absolute increase than in any other Canadian province, and a relative increase of a little less than 11 per cent. Capital, Quebec; population, 68,834 in 1901, as compared with 63,090 in 1891. The educational system is sectarian; that is, the schools are distinctively either Roman Catholic or Protestant. In 1901-02 there were 6643 teachers and 5245 elementary schools, with a total enrollment of 314,881 pupils, and the total expenditure for education was \$3,251,714.

Government and Finance.—The province is administered by a lieutenant-governor assisted by a responsible ministry. The legislative council consists of 24 members appointed for life by the governor-general in council, the legislative assembly has 74 members elected for five years on a property qualification. Quebec has 24 Dominion senators and 65 members in the House of Commons. The revenue and expenditure for the fiscal year 1901 were \$4,563,432 and \$4,516,257 respectively, as compared with \$4,451,578 and \$4,433,386 in 1900.

Commerce.—The trade for the fiscal year 1902 exceeded that of the previous year, the total being \$173,071,644, as compared with \$170,256,899 for 1901. The exports were \$91,057,201 as against \$93,540,609 in 1901, and the imports were \$82,014,443, as against \$76,716,290 in 1901.

History.—The annual session of the legislature opened on February 13, 1902. The prosperity of the province was well maintained during 1902. Conservative opposition policy was restricted to attacks upon the government for its alleged remissness in securing increased subsidies from the Dominion, and to charges of provincial connivance with the Dominion government in regard to the Manitoba school question, which was declared to be still unsettled. During the year there were some outspoken though unimportant attacks upon British imperial policy, and the danger of involving the French Canadian population in foreign wars was pointed out. Leading French Canadians, however, disavowed the sentiments which appeared in certain journals publishing these attacks, and towards the close of the year a French Canadian cabinet minister at Ottawa, Hon. Mr. Prefontaine, in an interview, expressed the belief that his compatriots of Quebec would favor the building of a Canadian railway. Conferences of the provincial premiers of Canada convened for the main purpose of securing increased subsidies from the Dominion, were held during the year at Quebec, and it is practically assumed that increased subsidies will be granted. An influential railway syndicate of British and Canadian capitalists was formed at the city of Quebec to build another Canadian transcontinental line, the Trans-Canada Railway, crossing the continent north of the Canadian Pacific Railway and with a terminus on the Pacific Coast. On June 23 an immense gathering of French-Canadians from all parts of the continent celebrated at the city of Quebec the sixtieth anniversary of the St. Jean Baptiste Society. The parade was viewed by 75,000 people, of whom 25,000 were strangers. The development of water powers and the building of pulp mills and other manufacturing plants by American capital have noticeably increased during the year.

QUEENSLAND, a state of the Commonwealth of Australia, has an estimated area of 668,252 square miles, and a population, according to the census of 1901, of 503,266, an increase over the census figures of 1891 of about 28 per cent. The capital is Brisbane, with a population (1901), including suburbs, of 119,428. Primary edu-

cation is free and nominally compulsory. The enrollment in 972 state schools in 1901 was 70,432, and in 169 private schools, 12,773.

Government and Finance.—The executive authority is vested in a governor appointed by the crown (Sir Herbert Charles Chermiside, appointed 1902), and assisted by a cabinet of nine responsible heads of departments. The legislature consists of a council of 42 members appointed by the crown for life, and an elective assembly of 72 members. The state revenues for the fiscal year ending June 30, 1902, amounted to £3,535,000, as compared with £4,403,225 in 1900-01. The expenditures for the same period were £3,967,000, as compared with £4,958,806 in 1900-01. At the beginning of 1902 the public debt was officially stated to be £38,272,627, an increase from £35,898,414 on January 1, 1901. The revenue is largely derived from customs, railways, the public lands and excise; the expenditures are principally devoted to public works, public instruction, and the interest on the public debt.

Industries, Commerce, etc.—Of the total area of the colony, about 97 per cent. is still owned by the state. About one-half of the area consists of forest lands. The pastoral industry is the largest in the state, the horses, in 1900, numbering 456,788; cattle, 4,078,191; sheep, 10,339,185; and swine, 122,187. Agriculture is little developed, only 480,372 acres being under cultivation in 1900. The leading crop is maize, the yield of which in 1900 amounted to 2,456,647 bushels; the wheat yield in the same year was 1,194,088 bushels. The sugar-cane crop is of growing importance, the production in 1901 being 112,031 tons. There are 86,848 acres under gold-mining and mineral leases, the gold output in 1900 being 963,189 ounces, and in 1901 835,553 ounces. The product of the coal, tin, copper, and silver mines are also of considerable value. The imports of Queensland decreased in value from £7,184,112 in 1900 to £6,376,239 in 1901, and the exports from £9,581,562 to £9,249,366. The chief exports in 1901 were: Gold, £2,185,495; wool, £2,131,864; meat, £1,283,183; sugar, £789,191; live stock, £713,206; and hides and skins, £419,228. The railways, nearly all of which are owned and controlled by the state government, had a total mileage in 1901 of 2801 miles in operation. The cost of railway construction to the state up to 1901 was £19,526,370.

History.—In Queensland, one of the last and most reluctant of the Australian states to enter into the Commonwealth, have appeared the first open and official avowals of a desire to withdraw from the union. The growth of the states-rights movement there can be attributed largely to the fact that the most pressing political problem in the state is not the tariff problem upon which the elections in the other states are fought out, but that of the abolition and exclusion of Kanaka, or Polynesian labor, without which, it is declared, the sugar growing industry must die. Queensland claims the right to settle this question for herself but the Commonwealth Parliament in 1901 passed a law, which, while its terms were general, really applied only to Queensland. By its provisions over 9000 Kanakas, 3600 of whom have deposits of over £27,000 in the state savings banks, will be compelled to leave the country by the end of 1906. Without them the sugar planters complain they will be obliged to abandon their plantations and factories. In spite of official protests from Queensland the bill was approved early in 1902. Early in February, 1902, the state parliament was dissolved and the Hon. Robert Philp, the premier, issued an election manifesto in which he voiced the dissatisfaction felt in Queensland with the result of Australian federation, and declared that the Commonwealth government had bitterly disappointed many of the strongest advocates of the union. In the March elections to the assembly the Philp ministry was given a new lease of power by the election of 38 members, including all the cabinet members, as against an Opposition, largely Laborites, of 30. In June another attempt was made by the ministry to secure the disallowance of the Kanaka Labor Act which brought forth a specific declaration from Mr. Chamberlain that as the act involved no imperial public interest His Majesty could not disallow it. The dissatisfaction increased and early in October on the reassembling of the state parliament a resolution was moved by Mr. Plunkett calling on the ministry to take early steps to secure the separation of Queensland from the Commonwealth.

QUICKSILVER. See MERCURY.

QUIMBY, EDWARD EVERETT, an American inventor and patent expert, died February 17, 1902, at Orange, N. J. He was born February 9, 1831, in Bangor, Me. When still a young man he became superintendent of the American Screw Company for which he invented a screw-machine that is still in use. He opened an office in New York in 1886. He had not had the advantage of a scientific, or even a collegiate training, but the faculty of keen observation and soundness of judgment, together with tireless energy, placed him at the head of his profession as a mechanical expert. He was connected with some of the most important patent cases in the country, including the litigation over patent rights of the Bell Telephone Company, and the Western Union Telegraph Company, and the Harvey Steel and Mannesman Tube patents.

RABIES. Dr. G. G. Rambaud, in the *Medical News*, gives the clinical symptoms upon which he establishes the diagnosis of rabies in dogs. These are: (1) Change in the disposition of the dog; (2) unusual manifestations of attachment to its master; (3) disappearance from its home for from several hours to two days; (4) change of bark or total abstinence from barking even on provocation; (5) lack of appetite, difficulty in chewing and swallowing solid food; (6) excitement and hallucinations; the animal snaps at imaginary objects, may attack its own master. Excitement caused by the sight of another dog. This stage may be absent in the dumb form of the disease; (7) the animal eats its own bedding, tears cushions, carpets, etc.; (8) inability to eat; the animal takes food into the mouth but drops it out after one or two attempts at swallowing; drinking, however, is little or not at all interfered with, and *there is no fear of water*; (9) unsteady gait which shows the beginning of the paralysis of the hind legs; dilated pupils; (10) later, paralysis of the lower jaw and general paralysis. The diagnosis of rabies in man is always attended with considerable anxiety both to physician and patient. The only means for the diagnosis of this malady before its actual onset, has been the experimental inoculation of rabbits with an extract of the spinal cord of the rabid animal. Some assistance in this direction is apparently furnished by the researches of Rabieaux and Nicolas, published in 1902. They examined the urine of animals at all stages of the disease, and found the presence of sugar in almost every instance, and they conclude that the test is a valuable aid to the diagnosis of rabies, if not a positive diagnostic sign. The amount of sugar is frequently very small and a delicate test for sugar (the phenylhydrazin test) has to be employed. Many cases of hydrophobia occurred in New York City during 1902.

RACING. The season of 1902, for both runners and harness horses, was one of the most brilliant in the history of the American turf. A feature of the running season was the firm stand assumed by stewards throughout the country on the cases of foul riding and other questionable practices brought to their attention, thus denoting the intention to remove from the sport its evident evils. The most important stake events of the year with distance, winner's name, and place of performance, were: American Derby, $1\frac{1}{2}$ miles, Wyeth, Chicago; Belmont Stakes, $1\frac{3}{8}$ miles, Masterman, Morris Park, N. Y.; Brighton Handicap, $1\frac{1}{4}$ miles, Gold Heels, Brighton Beach, N. Y.; Brooklyn Handicap, $1\frac{1}{4}$ miles, Reina, Gravesend, N. Y.; California Derby, $1\frac{1}{4}$ miles, Sombrero, Oakland; Crescent City Derby, $1\frac{1}{4}$ miles, Lord Quex, New Orleans; Futurity, $\frac{3}{4}$ mile, Savable, Sheepshead, N. Y.; Junior Champion, $\frac{3}{4}$ mile, Acefull, Gravesend, N. Y.; Metropolitan Handicap, 1 mile, Arsenal, Morris Park, N. Y.; Suburban Handicap, $1\frac{1}{4}$ miles, Gold Heels, Sheepshead, N. Y. Abroad, the English Derby, $1\frac{1}{2}$ miles, 29 yards, run at Epsom Downs, near London, and considered the most highly prized stake in the world, was won, in 1902, by Ard Patrick, owned by J. Gubbins.

In harness racing, the best performances were: trotting, new records at two miles, 4 minutes 17 seconds, by Cresceus, present holder of the mile record (2 minutes $2\frac{1}{4}$ seconds); $1\frac{1}{8}$ miles, 2 minutes 22 $\frac{1}{2}$ seconds, Major Delmar; and $\frac{1}{2}$ mile by the same horse, 1 minute 1 second; and pacing, Dan Patch equaled the world's record of 1 minute 59 $\frac{1}{4}$ seconds; Prince Alert set a new record for $\frac{1}{2}$ mile at 57 $\frac{3}{4}$ seconds; and Direct Hal and Prince Direct made a new record for 1 mile by pacing teams, at 2 minutes 5 $\frac{1}{2}$ seconds. In 1902 there took place, also, a match race between E. E. Smathers's Lord Derby and T. W. Lawson's Boralma for the largest purse in the history of harness racing—\$20,000 a side and a share of the gate receipts, amounting to \$10,000 additional. The race was run at Hartford, Conn., and was won by Lord Derby in three heats.

RACQUETS and COURT TENNIS, related descendants of the ancient game of tennis, have in recent years slowly found a place in American sports, and in 1902 strengthened their position by successful seasons. The annual tournament for the racquet championship was held at Boston, Mass., in February and was won by Clarence H. Mackay, of New York, who defeated Quincy A. Shaw, of Boston, in the final round, 2—15, 15—12, 15—7, 15—11. In March, at Philadelphia, the doubles championship was won by G. H. Brooke and H. David, of Philadelphia. They defeated N. Etting and G. McFadden, of Philadelphia, in the finals, 15—6, 15—0, 15—6, 15—8. F. F. Rolland won the championship of Canada, while in England, E. H. Miles, Jr., again won the title. In court tennis, the championship tournament was held at the New York Racquet and Tennis Club in April. Joshua Crane, of Boston, retained the title by defeating L. M. Stockton, of Boston, in the finals, 6—2, 3—6, 6—2, 6—3. E. H. Miles, Jr., won the English championship for the fourth consecutive season.

RAILWAYS. The new railway mileage recorded for the year 1902 was greater than that constructed during any previous year since 1888. In round figures, about 6000 miles of new road were added during the year to the 198,787 miles

in operation on December 31, 1901, thus making the total length of the railways of the United States 204,787 miles. The greatest activity in new construction was in the Southwestern States, where Arkansas, Texas, Oklahoma, Indian Territory, and New Mexico added 2218 miles to their previous railway systems. Considering the work of individual States, Indian Territory leads the column with 541 miles, and is followed by Oklahoma with 532 miles, Texas with 480 miles, New Mexico with 358 miles, and Arkansas with 308 miles. Considered with reference to grouping of States, the new railway is distributed by the *Railway Age* as follows: New England States, 95.05 miles; Middle States, 219 miles; Central Northern States, 567.34 miles; South Atlantic States, 533.15 miles; Gulf and Mississippi Valley States, 481.57 miles; Southwestern States, 2570.11 miles; Northwestern States, 659.39 miles; Pacific States, 426.44 miles.

The greater part of the new construction has been carried on by the larger railway systems in the form of branch lines to open up new and undeveloped territory. As examples, the Chicago, Rock Island and Pacific built 626 miles; the St. Louis and San Francisco, 609 miles; the Santa Fé system, 185 miles; the Great Northern system, 194 miles; the Southern Pacific, 185 miles; the Chicago and Northwestern, 178 miles; and the Missouri Pacific, 137 miles. In addition to the construction of this large mileage of new lines the railways of the United States expended a vast amount of money during 1902 in betterments of their permanent way, structures, and rolling stock. The exact amount of money spent in these works is difficult to estimate, but official records show that the appropriations for new work and betterments aggregated about \$200,000,000, and of this sum it is probably fair to assume that two-thirds or say \$134,000,000 were expended during the year. Some notion of the amount of new rolling stock added to their equipment during the year by the railways of the United States is had from the following figures of new cars and locomotives ordered which have been compiled by the *Railway Age*:

Freight cars ordered.....	195,248
Passenger equipment cars ordered.....	3,459
Locomotives ordered.....	4,665

These figures are not exact, but they are substantially accurate and such errors as exist are negligible for all ordinary purposes of comparison. Regarding the character and quality of the equipment ordered little need be said except that the tendency of past years toward the use of heavier cars and larger and stronger locomotives was maintained. Comparatively few freight cars of less than 60,000 pounds capacity were ordered, and the orders were numerous for cars of 80,000 pounds and 100,000 pounds capacity. A considerable proportion of these larger cars were of steel construction. As to the increased size of locomotives it need only be mentioned that 460 locomotives were ordered during the year whose weight, including tender, was over 100 tons. Besides the number of engines of unusually heavy weight built during 1902, the year's construction has been notable for the number of "decapod" engines, or engines with five pairs of drivers and a pair of lurching wheels, which have been built for general heavy freight service. Formerly engines of this type have been used almost exclusively for pushing on heavy grades or other special service. Another notable feature of the year's work has been the number of engines working on the southwestern and Pacific railways which have been built for burning oil fuel instead of coal. The Southern Pacific Railway is converting practically all of its engines to oil burners, and the Atchison, Topeka and Santa Fé road is building many of its new engines for the same kind of fuel. In permanent way and track construction the tendency of past years toward heavier and more substantial construction was maintained during 1902. In important bridge and tunnel work the year was also notable. (See *BRIDGE-BUILDING AND TUNNELS*.) There was also important railway terminal improvements. The Pennsylvania tunnel terminal at New York City involving an expenditure of \$50,000,000, the new terminal of the New York Central in the same city, and the $5\frac{1}{4}$ miles of subway and viaduct by which the Long Island Railroad is freeing the streets of Brooklyn, N. Y., from grade crossings, are only magnified examples of the kind of work being done all over the country in cases too numerous to mention. Complete and reliable statistics of railway traffic and earnings will not be available until their publication by *Poor's Manual* and by the Interstate Commerce Commission late in 1903, but in December, 1902, the latter bureau published a preliminary statement of the income account of railways for the year ending June 30, 1902, of which the following is a summary:

"This report prepared by the statistician to the Interstate Commerce Commission, contains returns of railway companies operating 195,945 miles of line, or probably 98 per cent. of the mileage that will be covered in the full report on the statistics of railways for that year. The passenger earnings of the railways represented were \$472,429,165, and the freight earnings, \$1,200,884,603. Including these and other earnings from operation the gross earnings amounted to \$1,711,754,200, or \$8736 per mile of line, and operating expenses to \$1,106,137,405, or \$5645 per mile of line, show-

ing that net earnings were \$605,616,795, or \$3091 per mile. The net earnings of the roads, it appears, were \$51,395,421 greater than those which were received during the previous year. The total income of the roads covered by this advance report, including \$82,714,492 derived from investments and miscellaneous sources, was \$688,331,287. Deductions from income aggregated \$458,459,961. This amount comprised interest on funded debt, rent of leased lines, betterments charged to income, taxes (\$49,436,675), and various minor expenditures. The report shows that dividends declared on stocks amounted to \$150,685,959, and it appears from comparative figures that the dividends of essentially the same roads were \$29,834,690 greater for the last fiscal year than for 1901. The surplus from the operation of the roads for which returns are compiled was \$79,185,367. The complete report for the year ending June 30, 1901, gave a surplus of \$84,764,782. It should be stated that this report relates to operating roads only, and consequently does not include dividends paid by leased lines from the income they receive as rental. In the year 1901 the dividends of all the railway companies aggregated \$156,735,784, this amount including about \$35,000,000 paid by the leased lines."

RATAZZI, Mme., the name by which the French writer, Mme. Marie Studolmine Bonaparte de Rute, was popularly known. See **RUTE**.

RAWLINSON, GEORGE, canon of Canterbury, the English scholar who died in Cathedral Precincts, Canterbury, October 6, 1902, was best known as the interpreter to western readers of the history of the ancient East. He was born at Chadlington, Oxfordshire, November 23, 1812, studied at Trinity College, Oxford, was elected fellow of Exeter in 1840, and there, having taken orders, became tutor in 1842 and sub-rector in 1845. In 1846-47 he held a curacy at Merton, Oxfordshire, but subsequently returned to the university, where in 1859 he was appointed Bampton lecturer and was Camden professor of ancient history from 1862 until his resignation in 1889. He was appointed to a canonry of Canterbury in 1872, as the nominee of Gladstone, and in 1888 was preferred to the benefice of All Hallows, Lombard Street, London. His services to the church were less noteworthy than his work as historian, which, through his solid and wide, if not always first-hand scholarship, and his busy industry, won for him high recognition. The *History of Herodotus, a New Translation, with Notes, Appendices, etc.* (1858) and *The Five Great Monarchies of the Ancient Eastern World* (1862), hold distinguished place in the libraries of English and American students. Other titles are: *A History of Ancient Egypt* (1881); *A History of Phœnicia* (1889).

REED, THOMAS BRACKETT, speaker of the United States House of Representatives in the Fifty-first, Fifty-fourth, and Fifty-fifth Congresses, died in Washington, D. C., December 7, 1902. He was born in Portland, Me., October 18, 1839, and at the age of seventeen entered Bowdoin College, where he graduated in 1860. After teaching for a year in the Boys' High School in Portland he entered the law office of Howard and Strout, but before he had completed the period of his legal apprenticeship he sailed around the Horn to California. A few months of school-teaching in Stockton, and a like period of law study in San José, convinced him that opportunities were just as great in New England as on the Pacific Coast, and early in 1864 he returned to Maine. Immediately afterwards he obtained an appointment as an acting assistant-paymaster in the United States Navy, and served in the Civil War on the Western rivers from April, 1864, to November, 1865. Returning again to Portland he was at once admitted to the bar, and opened a law office. In three years, he had established a considerable practice, and won a reputation as a public speaker. He was elected to the lower house of the State legislature in 1868, and again in 1869. An able speech delivered in favor of the election of Lot M. Morrill as United States senator drew the attention of the politicians to him as a young man of exceptional power and unusual promise. His election to the State Senate followed in 1870, and while still a member of that body he was chosen to succeed Wm. P. Frye, as attorney-general of the State, but did not take the oath of office until after the adjournment of the legislature. His service as attorney-general, marked by ability and energy, lasted until 1872, when he retired to devote himself to his private practice. In 1874 he accepted the office of city solicitor of Portland, and served until his election to the Forty-fifth Congress in 1876. In the national House of Representatives he came rapidly to the front, and his constituents, recognizing his ability, returned him every two years. He obtained membership on some of the most important committees where his conscientious work established for him as great a reputation among his fellow members, as his readiness and ability in debate won for him before the public. In the Forty-seventh Congress Reed was made chairman of the judiciary committee and held positions on the important ways and means and rules committees. On the opening of the Fifty-first Congress, with a small Republican majority, he was chosen speaker. Congress met on December 2, 1889, and it immediately became evident that the Democratic minority meant to prevent legislation

THOMAS BRACKETT REED

Copyright by Dupont

by filibustering. To meet this factious opposition, and uphold the right of the majority, Speaker Reed, on January 29 and 30, 1890, adopted the plan of counting enough minority members present, but not voting, to make a quorum. The action, which won for him the title of "czar," raised a storm of protest at the time from the Democratic members, but they came in time to see the justice and good sense of his ruling and adopted it as their own under the speakership of Charles F. Crisp two years later. In another way Reed's influence was shown in 1890 when he prevented the passage by the House of Representatives of a free-silver coinage bill, which had already received the approval of the Republican Senate. In the next two Congresses, as leader of the Republican minority, he held his party in the House almost solidly in opposition to all attempts at free-coinage legislation. Always a strong protectionist, he wielded his power as speaker in behalf of the passage of the McKinley Bill in 1890, and led the Republican attack against the Wilson Bill in 1893, and when, upon the opening of the Fifty-fourth Congress with a Republican majority, he was again chosen speaker, he took every opportunity to aid the party leaders in perfecting and securing the passage of the Dingley Bill. In 1896 he was a prominent candidate for the Republican nomination for President, but was defeated by William McKinley of Ohio. At the fall elections of that year, he was re-elected to Congress, however, and as speaker rendered invaluable service to President McKinley, in facilitating as far as lay in his power the administration's war measures, and holding in check the jingoistic tendencies of the House. It was due to him personally that the Senate's rash joint resolution for the recognition of Cuban independence was defeated in the House at that time. He was never in accord with his party on the question of retaining the Philippines, and although re-elected to the Fifty-sixth Congress, he resigned before it assembled, and removed to New York City, where he practiced law up to the time of his death. Without question, Reed ranks as one of the greatest speakers the House of Representatives has ever had. No man in that position ever influenced legislation to such an extent as he, or left upon its code of procedure such a lasting impress.

REED, WALTER, who carried on the experiments relating to infection by mosquitoes, after the occupation of Cuba in 1898, died November 23, 1902, at Washington, D. C. He was born in 1851 in Gloucester County, Va., graduated from the University of Virginia and the Bellevue Medical College in New York City, and in 1875 entered the army as an assistant surgeon. His work in bacteriology and pathology won him recognition as one of the foremost authorities in those subjects in the United States, and in 1893 he was appointed curator of the army medical museum in Washington. During the Spanish war he was a member of the board appointed to investigate the causes of typhoid fever in the army. He was on duty afterwards in Cuba studying the causes of disease, especially yellow fever. The board came to the conclusion that disease was carried by mosquitoes, and sanitary measures instituted in accordance with this theory effected practically its extirpation. Major Reed headed the list of surgeon-majors and his promotion was assured.

REEVES, SIR CONRAD, chief-justice of Barbados, died there February 5, 1902. He was born in Barbados in 1838 of mixed parentage, and at an early age became an assistant in a printing office. Rising to the position of reporter he displayed such mental aptitude that his friends sent him to England to study law. After returning to Barbados, he soon became prominent in the practice of his profession through his powers as a debater and orator, was elected to the house of assembly in 1873, was solicitor-general from 1874 to 1876, and from 1882 to 1886 served as attorney-general. He became chief justice of Barbados in 1886, and was *ex-officio* president of the Windward Islands Court of Appeals. In 1889 he was knighted.

REFORMED CHURCH IN AMERICA (DUTCH), known until 1857 as the Reformed Protestant Dutch Church, dates from 1628, the year of the establishment of its oldest church. It now has 652 churches, 717 ministers, and 112,898 communicants; and 921 Sunday-schools with 124,672 members. Its greatest strength is in New York and New Jersey, and in those Western States where Hollanders have settled. For congregational purposes, the contributions of the past year were \$1,231,464; for denominational enterprises, \$276,028; for other objects, \$115,203. The ninety-sixth annual session of the General Synod was held in Asbury Park, N. J., beginning June 4. The reports from the various activities of the church indicated general prosperity, those of the Foreign and Domestic Mission Boards being particularly encouraging since both boards had closed the year without debt. The former conducts five missions in China, India, Japan (2), and Arabia, with 24 stations and 249 out-stations, employing 85 missionaries and 573 native workers. Native contributions aggregated \$14,548. The board received \$25,000 for the equipment and endowment of the Elizabeth R. Voorhees College at Vellore, India. The Board of Domestic Missions administers two funds—for missions and for church building; its total income for 1902 was \$95,243. Its work is carried on through three,

divisions: Eastern, Western, and Southwestern, and is directed with special attention to the Germans, Hollanders, Indians, and negroes. During the year several new missions were undertaken and three new churches established, and eight churches became self-supporting. There are under the control of the denomination two colleges and theological seminaries, and a theological seminary in India, and five preparatory schools. Its publishing interests include ten periodicals in English, Dutch, and German, the headquarters of the Board of Publication being in New York City. The revision of the liturgy came up before the General Synod, but no definite action was taken, the matter being referred to a committee which was instructed to prepare amended forms to be reported at the next meeting in Asbury Park, June 3, 1903. Before adjournment a special committee was appointed to consider the scheme for federation of the several bodies holding the Presbyterian system. A resolution favoring this movement was introduced at the meeting of the General Synod of the Reformed Presbyterians (q.v.); and to the General Assembly of the Presbyterian Church in the United States (South) (q.v.) was presented an overture concerning the advisability of organic union with the Dutch Reformed Church. Stated clerk, Rev. William H. De Hart, D.D., Raritan, N. J.

REFORMED CHURCH IN THE UNITED STATES (GERMAN), was organized in 1747 and became independent of the Dutch Reformed Church in 1793. Under the General Synod, which was established in 1863, there are now 8 district synods and 58 classes, corresponding with the presbyteries in Presbyterian bodies. The church has 1691 congregations and 1112 ministers, and 255,408 communicants, an increase of nearly 6500 members during the past year. The contributions both for benevolent and for congregational purposes, also, show a consistent gain in the same period, receipts for the former aggregating \$283,954 as compared with \$264,344 in 1901, while those for congregational purposes amounted to \$1,396,654, as against \$1,303,217 in the previous year. There are in the church 1662 Sunday-schools with 24,796 officers and teachers, and attended by 200,178 scholars. The educational interests are represented by four theological seminaries, five colleges, and eight collegiate institutions and academies. Students preparing for the ministry number 199. The German Reformed Church conducts organized missionary work in Japan and China, and its home missions are carried on through Bohemian, Hungarian, German-English, English, and Harbor departments, including about 100 branches under the auspices of the general board, besides a number maintained by the German boards. The board of publication, whose headquarters are in Philadelphia, issues a score of periodicals, the majority of which are in English. The General Synod, the supreme body of the church in judicial and legislative matters, convenes every three years, the session of 1902 having been held in Baltimore, Md., beginning May 20. In 1905 the General Synod will meet in Allentown, Pa. Stated clerk, Rev. John Ph. Stein, D.D., Reading, Pa.

REFORMED EPISCOPAL CHURCH, was founded on December 2, 1873, by seceding members of the Protestant Episcopal Church who opposed the seeming "High Church" tendency in that church. It now has 10,344 communicants, 6 bishops, and 70 presbyters and 12 deacons. There are 6 synods and missionary jurisdictions with 95 churches and missions, having a property valuation, less incumbencies, of \$1,669,766. The Sunday-schools, 90 in number, are attended by 11,330 members. Contributions for all purposes during the past year aggregated \$165,554. Under the auspices of the church are a theological seminary (value, \$90,000) at Philadelphia, and an orphanage at Lalitpur, and a hospital at Lucknow, India. The offices of the publication society are in Philadelphia. The next General Council, which convenes triennially, will be held in Cleveland, O., beginning May 20, 1903. The Reformed Episcopal Church this year lost by death Rt. Rev. James A. Latané, D.D., who was succeeded as presiding bishop by the Rt. Rev. Samuel Fallows, D.D., of Chicago. Dr. William T. Sabine, of New York City, was consecrated a bishop in place of the deceased member of the episcopate.

REFORMED PRESBYTERIANS, descended from the Reformed Presbyterians of Scotland, are included in several divisions: *Reformed Presbyterian Church in the United States (Synod)*, having 126 ministers, 112 congregations, and 9722 communicants; *Reformed Presbyterian Church in North America (General Synod)*, having 33 ministers, 37 churches, and 5000 communicants; *Reformed Presbyterian Church (Covenanters)*, having 1 minister, 1 church, and 40 communicants; *Reformed Presbyterian Church in the United States and Canada*, having 1 minister, 1 church, and 600 communicants (in the United States only). The Synod has under its auspices a college and a seminary, and conducts active home and foreign missionary work, the receipts for which amounted to about \$34,500. The total contributions for the past year were \$190,079. The annual meeting of the Synod was held in May, in Syracuse, N. Y.; its next meeting will convene in Hopkinton, Ia. The session of General Synod, convened in Philadelphia, was notable chiefly for the resolution

adopted inviting all those bodies holding the Presbyterian system to unite in one General Assembly, an indication of the tendency toward federation that has marked the year 1902. In 1903 the General Synod will meet in South Ryegate, Vt.

REFUSE DISPOSAL. See GARBAGE DISPOSAL.

RÉUNION, an island about 420 miles east of Madagascar, is a French colony, having an area of 965 square miles and a population (1897) of 173,192. The capital is St. Denis. The colony is administered by a governor and an elected council-general, and is represented in the French parliament by a senator and two deputies. The local budget for 1901 balanced at 5,033,700 francs, and the French budget for 1902 included an expenditure for the colony of 4,661,851 francs. The latter figure included 2,452,000 francs for railway and harbor building. (The franc is worth 19.3 cents.) The chief products and exports are sugar, coffee, vanilla, spices, and cacao. Imports and exports in 1900 were valued at 22,029,363 francs and 17,461,279 francs respectively; in 1901, 23,775,948 and 18,200,523 respectively. The leading imports are rice (6,243,321 francs in 1901), other food stuffs, cotton textiles, and iron and steel goods. The sugar export in 1901 amounted to 11,541,285 francs. The trade is very largely French; in 1901 the imports from and the exports to France and French colonies being about 16,483,000 francs and 18,021,000 francs respectively. There are 83 miles of railway, owned by the government. In the fall of 1902 the French government contracted for a telegraphic cable from Tamatave (Madagascar) to Réunion and from Réunion to Mauritius.

RHODE ISLAND, a New England State of the United States, has an area of 1250 square miles. Rhode Island was one of the original thirteen States of the Union. The population in 1900 was 428,556, and in June, 1902, as estimated by the government actuary, 447,000. By a constitutional amendment in 1900 Newport was abandoned as the second capital of the State, and Providence was made the sole capital. The largest cities in 1900 were: Providence, 175,597; Pawtucket, 39,231; and Woonsocket, 28,204.

Finance.—The balance on hand in the treasury of Rhode Island on January 1, 1902, was \$158,272.71. The total receipts during the year were \$1,490,621.96 and the expenditures \$1,537,502.41, leaving a balance on December 31, 1902, of \$111,392.26. The total funded debt at the end of the year was \$2,978,000. From this, however, should be deducted a sinking fund of \$444,451.56, leaving a net funded debt of \$2,553,548.44. The amount of debt reduction during the year was \$250,014.95, and there was an unfunded debt of \$20,000. It was recommended by State officials that the mode of taxation be to some extent changed and that a law be enacted similar to the Ford Franchise Tax law of New York, under which all quasi-public corporations would pay taxes at the same rate as did private individuals upon their real estate.

Industries.—The latest official statistics of industries in Rhode Island cover the year 1900, when 186 textile manufacturing establishments reported to the Rhode Island bureau of statistics. The average number of employees for that year was 46,220, as against 44,832 for the previous year. The total wages paid were \$17,404,954, an increase of \$1,771,438, or 11.33 per cent. The average yearly wages increased from \$348.71 to \$376.57, or 7.99 per cent. The real estate owned by textile manufacturers amounted to \$24,601,128, the personal estate amounted to \$14,055,554, making a total capital of \$38,656,682 invested in the textile industries, upon which \$480,803.11 in taxes were paid to the State. The metal industries were especially active during 1902.

Conventions and Platforms.—The platform of the Democratic State convention, held at Providence on October 1, opposed "government by injunction"; favored the popular election of federal senators; pledged support to laws ameliorating the condition of the working classes; attacked the Republican State administration for legislation said to favor corporations; and demanded the initiative and referendum, ownership of public utilities, and a three-cent car fare. The Republican State convention, held at Providence on October 1, endorsed the President's policy; recommended his nomination in 1904; upheld protection, though recognizing that new conditions might require a readjustment of tariff rates, and demanded summary legislation for the correction of evils growing out of aggregations of capital, though not condemning such aggregations when they resulted in cheaper prices to the people.

Elections.—At the annual election, held November 4, 1902, the Democrats elected the governor and lieutenant-governor, all the other State offices being secured by the Republicans. The vote for governor was Garvin (Dem.), 32,297; Kimball (Rep.), 24,541, giving Garvin a plurality of 7738. Dr. Garvin has figured conspicuously in Rhode Island politics for the past twenty years, and has several times served in the House of Representatives. It is thought that his election was due largely to the action of Governor Kimball in calling out the militia during the

Providence-Pawtucket street railway strike in the summer of 1902—an action which made the governor unpopular with the labor unions throughout the State. The State legislature for 1903 will consist of 27 Republicans and 11 Democrats in the senate, and 37 Republicans and 35 Democrats in the house.

State Officers.—For 1902: Governor, Charles D. Kimball; lieutenant-governor, George L. Shipley; secretary of state, Charles P. Bennett; auditor and commissioner of insurance, Charles C. Gray; treasurer, Walter A. Read; attorney-general, Charles F. Stearns; superintendent of public instruction, T. B. Stockwell; railroad commissioner, Edward L. Freeman—all Republicans. For 1903: Governor, L. F. C. Garvin, elected for one year, term ending January, 1904; lieutenant-governor, Adelaar Archambault; secretary of state, Charles P. Bennett; auditor and commissioner of insurance, Charles C. Gray; treasurer, Walter A. Read; attorney-general, Charles F. Stearns; superintendent of public instruction, Thomas B. Stockwell; railroad commissioner, Edward L. Freeman—all Republicans except Garvin and Archambault.

Supreme Court for 1902 and 1903: Chief justice, John H. Stiness; associate justices, Pardon E. Tillinhiast, George A. Wilbur, Horatio Rogers, William W. Douglas, Edward Church Dubois, and John Taggard Blodgett—all Republicans.

For congressional representatives, see UNITED STATES (paragraph Congressional Representatives).

RHODES, CECIL JOHN, a South African statesman and capitalist, died at Cape Town, March 26, 1902. He was born in the vicarage of Bishop's Stortford, Hertfordshire, England, July 5, 1853, and after studying at the grammar school of his native town had his name entered in 1870 at Oriel College, Oxford. A severe attack of lung trouble made it necessary for him to leave England, and in July of the same year he sailed for Natal, where his elder brother was engaged in cotton-raising. Rhodes landed in South Africa in the very midst of the rush for the newly discovered diamond fields of Griqualand West, and after a few months spent in farming, caught the diamond fever and in 1871 was at Kimberley. Within a year he was rich, and as his health continued to improve in the dry air of the uplands, he determined to return to England for the purpose of resuming his interrupted education. In 1873 he was matriculated at Oxford, and from 1876 to 1881, in which year he received his B.A. and M.A., he kept his terms at the university, passing six months of the year in England and six months in Africa, where he dug diamonds and speculated in mining claims with conspicuous success. In 1880 he was elected to the Cape parliament from Barkly West. His earliest efforts were directed toward establishing closer relations between the British and the Dutch inhabitants of the Colony, as the first step toward bringing about the supremacy of the British empire in South Africa, for even at this time Rhodes recognized that "Great Britain could rule South Africa only through the Dutch." In 1881-82 he began to advocate the extension of the British authority over Griqualand West and Bechuanaland for the purpose of preserving the trade route into the interior and keeping an open field for the future expansion of Cape Colony. Already Boer commandos from the Transvaal had trekked into Bechuanaland and had set up a number of miniature republics, preparatory, Rhodes believed, to the absorption of the country by the Transvaal. His exhortations stirred a sluggish ministry to action, and in February, 1884, Bechuanaland was declared a British protectorate. As deputy-commissioner, Rhodes in 1885 for the first time came into contact with President Kruger, destined to become his life-long rival. In 1887 the Boers began to cross the Limpopo River into Matabeleland, and Rhodes discerned in this a further danger to the progress of British expansion northward. In 1888 Lobengula, king of the Matabele, pledged himself to permit no power except Great Britain to establish a protectorate over his land. The home authorities, however, made no effort to follow up this gain, and Rhodes hit upon the plan of a chartered company that should take possession of the vast region beyond the Limpopo, and hold it in trust, as it were, for the British empire. From Lobengula Rhodes obtained the sole right of searching for minerals within his dominions, and in October, 1889, the British South Africa Company was incorporated for a period of twenty-five years, and acquired full rights of sovereignty over an area of 174,000 square miles, subject only to the distant and problematical control of a British secretary of state. The sole power in fact rested in the hands of Rhodes. In September, 1890, a band of 180 pioneers founded Fort Salisbury in Mashonaland, the first of a number of settlements that sprang up in what soon came to be called "Rhodesia." The great outlays involved in opening up the country were met by Rhodes from the surplus funds of the De Beers Consolidated Mines, a corporation controlling the entire diamond industry at Kimberley and formed in 1888 after nearly fifteen years of effort on the part of Rhodes, who, with Mr. Alfred Beit (q.v.) and Barney Barnato, stood at the head of its affairs.

In 1890 Rhodes became premier of Cape Colony with the support of the Afri-

CECIL RHODES

cander Bond. While in office he accomplished much good in the important field of legislation dealing with the native races. He also pursued his object of welding together the British and the Dutch elements into one nationality; advocated, for this purpose, the establishment of a teaching university at Cape Town for students from the different South African states; and spoke openly of what he regarded as the inevitable political outcome—the federation of South Africa under the British flag. In 1893 the Matabele broke out into a formidable insurrection, which for a time threatened the existence of the settlements in Rhodesia. After severe fighting the natives were defeated, Lobengula was forced to flee, and Matabeleland was brought under the rule of the Chartered Company. Rhodes immediately set to work to repair the ravages of the war. It was the necessity of bringing Mashonaland nearer to the Cape that led him to conceive the plan of a telegraph line and a railway running from Cape Town to Rhodesia all the way through British territory—a plan which matured into the celebrated Cape-to-Cairo Railway (*q.v.*).

The Jameson Raid came as a crushing blow to Rhodes. The full truth of the Raid has not yet been ascertained, but Rhodes took upon himself the responsibility for Dr. Jameson's act, although he repeatedly declared that the latter had "gone in" without his orders. On December 31, 1895, he laid down the premiership. For some time thereafter he busied himself with the interests of Rhodesia, where a rising of the Matabele was terminated in 1896 by an act of daring on the part of Rhodes, who, unarmed and with only two companions, entered the enemy's camp and bullied the Matabele into arranging terms of peace. In February, 1897, Rhodes appeared before the committee of the House of Commons appointed to investigate the Jameson Raid. There he justified his course in regard to the Transvaal by reciting the wrongs of the Uitlanders, the iniquities of the "Boer oligarchy," and the danger of German interference in South African affairs to the detriment of Great Britain.

In 1898 Rhodes was re-elected to the Cape parliament, but he passed the greater part of the two succeeding years in England and on the continent, carrying on negotiations with Mr. Chamberlain and the German emperor in regard to his Cape-to-Cairo Railway and telegraph. In 1899 he received the degree of D.C.L. from Oxford. Back in Cape Colony in July of the latter year, Rhodes scoffed at the idea of war with the Transvaal, being seemingly persuaded that President Kruger was playing his old game of "bluff." Upon the outbreak of the war Rhodes barely had time to throw himself into Kimberley before it was invested by the Boers. Although at odds with the military authorities, he took a leading part in the defence of the town. During the progress of the war his old illness attacked him. He went to Egypt in the early part of 1901, but failed to find health there, and returned in February, 1902, to Cape Colony. He died after a long period of unconsciousness, and, in accordance with the desire expressed in his will, was buried on his estate in the Matoppo Hills, near Buluwayo.

In his lifetime Rhodes was variously characterized as the greatest of living men, as the worst example of the triumphant capitalism of the nineteenth century, as a dreamer of empires, and as an unscrupulous adventurer. He was theatrical, sincere, cynical, naive, unimpeachably honest, and a gambler in stocks. In a measure all of his critics were right. Early in life Rhodes had become convinced that the interests of England and the welfare of humanity required the extension of the British rule over the world. As a preliminary step, it was essential that all the members of the English stock should be united. Rhodes dreamed, therefore, of a federated empire embracing the English-speaking world and held together by the ideals of liberty and justice that are the peculiar inheritance of the English race. To undo the work of the American Revolution, Rhodes was prepared to adopt the United States Constitution as the organic law for his empire and to have his imperial parliament meet alternately at Washington and Westminster. He perceived that the execution of his plans was the work neither of one man nor of one day, and he conceived the project of a secret society of wealthy men throughout the world, who after the manner of the Jesuits should labor for the attainment of the great end. If Oxford had taught him ideals of world-wide rule and imperial responsibilities, the diamond fields of Kimberley and the company of men like Barney Barnato had endowed him with a full appreciation of the power of wealth. Wealthy men, chartered associations working for profits, railway and telegraph companies, were to bring about the desired end. The world was to be redeemed by Anglo-Saxon ideals working through financial channels; or, as he himself called it, through "philanthropy and 5 per cent." With time, however, Rhodes grew less sanguine as to the realization of his ideal, and he prudently narrowed the sphere of his ambitions from the world to the Dark Continent and from a federated British empire to a federated South Africa under the British flag, to be made, in time, co-extensive with the limits of the continent.

With Rhodes the belief in the superiority of the English race was the result not

of reasoning but of feeling. He had implicit faith in his intuitions, and he possessed that sublime courage and steadfastness which often come from lack of a higher education; for, in spite of his world-embracing schemes, Rhodes had not that broadness of spirit or intellect which we designate as "culture." A vast, rugged, unlearned simplicity was the basis of his nature, and it revealed itself in many ways in his personality and his actions; in his intense earnestness, his direct method of attack on whatever problem presented itself, his disregard of the finer problems of ethics in the realm of advanced finance and politics, his incapacity for deep, analytic reasoning, his general homeliness of expression. Nothing perhaps better reveals the blending in Rhodes of what at times approaches the sublime with the trivial and the crude than that remarkable document, his will. The man who left an immense fortune for the purpose of educating the Anglo-Saxon youth to the ideas of empire, and who with splendid faith designated his home as a residence for the prime minister of "the States of South Africa," left also a fund for "the maintaining of at least two carriage horses" for the use of this minister. His estate in the Matoppos Hills, where his body now rests, he reserved as a national cemetery for those whom the federal government shall have decreed deserving of their country "by a majority of two-thirds." Finally, Rhodes charges his trustees to build a short railway from Buluwayo to Westacre, "so that the people of Buluwayo may enjoy the glory of the Matoppos between Saturday and Monday."

For an account of the scholarships established by Cecil Rhodes in his will, see **UNIVERSITIES AND COLLEGES.**

RHODESIA, an inland territory of South Africa, under the protection of Great Britain, has an area not definitely determined but estimated by some authorities at about 454,000 square miles. The population also is unknown, but is probably over 1,170,000. Rhodesia, which is divided by the Zambezi River into two parts, Southern and Northern, extends from the Transvaal northward to the Congo Free State and German East Africa.

Southern Rhodesia consists of Matabeleland (bounded on the south by the Limpopo, and Mashonaland (reaching to the Zambezi); on the east and west respectively are Portuguese East Africa and the Bechuanaland Protectorate. According to an enumeration of May, 1901, Matabeleland had 170,128 inhabitants, of whom 162,211 were natives, and Mashonaland 332,937, of whom 328,729 were natives. On March 31, 1902, the natives were estimated at 515,000. In 1902 the white population of Salisbury (Mashonaland), the capital of Southern Rhodesia, was stated to be about 4500, and of Buluwayo, the chief town of Matabeleland, about 7500. Near Buluwayo, on April 10, 1902, Cecil Rhodes (*q.v.*) was buried. Southern Rhodesia is administered, under the high commissioner for South Africa, by the British South Africa Company in virtue of its charter which was granted October 29, 1889, and amended by the orders in council of May 9, 1891, July 18, 1894, and November 25, 1898. Registered voters elect a minority representation in the legislative council. The administrator in 1902, representing the company, was W. H. Milton (since 1898), and the resident commissioner, representing the imperial government, Lieut.-Col. Sir Marshall Clarke (since 1898). For the fiscal year 1901, revenue and expenditure are stated at £406,467 and £639,239, respectively; for 1902, £435,257 and £710,563, respectively; for 1903 the revenue was estimated at £515,200. The country is rich in minerals, especially gold and coal; the output of gold for the fiscal year 1902 amounted to 180,889 ounces. The success of the Chartered Company in developing the country has been remarkable, despite the difficulties occasioned by the rinderpest and locusts in 1896, native insurrections in 1896 and 1897, and the Boer War, 1899-1902. The most serious difficulty now is the scarcity of labor, and in some quarters the company has been criticised for its practically coercive methods of procuring native workers for the mines. One of the principal efforts of the company has been the construction of railways, and this work is being steadily carried forward. (For the main lines, the Mashonaland, or Beira, and the Rhodesian, see **CAPE-TO-CAIRO RAILWAY.**) There is a light railway from Salisbury to the Ayrshire coal mine (78 miles); a line from Buluwayo to the Gwanda district (95 miles), for gold and coal exploitation, was under construction in 1902, and in the fall of that year provision was made for lines between Salisbury and the Mazoe district (26 miles), and Gwelo and Selukwe (about 21 miles). In December, 1902, it was announced that the Chartered Company had decided to expend £2,000,000 on Rhodesian railways. Of this sum £1,000,000 was to be expended forthwith upon the extension of the Rhodesia (Cape-to-Cairo) railway to Victoria Falls, and for the construction of various branch lines and improvements on railway already built. The second £1,000,000, which would probably be sanctioned by the end of 1903, would be used in carrying the Cape-to-Cairo line about 300 miles north of the Zambezi.

In August, 1902, further discoveries in the remarkable ruins at Zimbabwe were reported.

Northern Rhodesia, which with the British Central Africa Protectorate (Nyassaland) is also known as British Central Africa, is bounded on the east by that protectorate and on the west by Angola. Estimates place the area at about 310,000 square miles and the number of inhabitants at upwards of 640,000. The territory, which is administered by the British South Africa Company, under orders in council of 1899 and 1900, is divided into Northeastern Rhodesia and Northwestern Rhodesia (Barotseland). The administrator of the former in 1902 was Robert E. Codrington (since 1900), resident at Fort Jameson; and of the latter Robert T. Coryndon (since 1900), with headquarters at Lealui. To a large extent the natives are still governed by their own chiefs. The Cape-to-Cairo Railway (*q.v.*) will pass through Barotseland. Under the native king of Barotseland, Lewanika (a picturesque personage at the coronation of King Edward VII. in August, 1902) the arts of peace and civilization have made noteworthy progress. Upon leaving England for home on August 23, he said he hoped the British government would prevent other powers from encroaching upon "his" territory, and that so far as practicable he would adopt European methods in his native land. In December, 1902, the British South Africa Company proclaimed the whole of Northeastern Rhodesia closed to the rubber trade from January 1, 1903.

RIBOLDI, AGOSTINO, member of the Sacred College of Cardinals of the Roman Catholic Church, died at Rome, Italy, on April 26, 1902. He was born at Paderno Milanese, archdiocese of Milan, February 18, 1839, became archbishop of Ravenna, and on April 15, 1901, was created and proclaimed cardinal-priest, with appointment to the titular church of SS. Nereo e Achilleo.

RICE. The extension of the area devoted to rice growing in Texas and Louisiana has continued during 1902, and preliminary experiments by the Arkansas experiment station in cooperation with farmers indicate that rice may be profitably grown on the prairies in eastern Arkansas. An important report on the irrigation of rice in the United States has been issued by the Department of Agriculture as Bulletin 113 of the office of experiment stations. This shows that, through the successful introduction of a system of irrigation suited to the local conditions in Louisiana, lands which in 1888 were valued at from \$1 to \$3.50 per acre, now bring from \$30 to \$50 when under large canals, and even the rice land not under canals and at a distance from the railroad is valued as high as \$15 per acre. Measurements of the water used in the irrigation of rice at Crowley, La., and Raywood, Texas, have been recently made by experts of the Department of Agriculture. At Crowley a rice field of 37.44 acres received 16.47 inches of water from the canals and 10.04 inches from rainfall, or a total of 26.51 inches. The evaporation during the same period amounted to 14.47 inches, leaving a net supply of 12.04 inches of water for the crop. The data obtained at Raywood indicated that a net amount of 12.78 inches of water was required to mature the crop under investigation. The cost of the fuel necessary to irrigate an acre of rice was from 60 cents to \$1 when oil was used, and from \$2 to \$3 when wood or coal was used. Crude mineral oil has proved a most satisfactory fuel for this purpose. Most of the pumps have thus far been operated by steam, but two electric plants have been in successful operation the past season in Texas, and it is believed that electricity may be profitably employed in this way. Many wells are being sunk for irrigating purposes in the rice-growing region of Texas and Louisiana. An 8-inch well waters from 100 to 140 acres, and the farm methods and earnings are the same as when canals are used for irrigation. It is estimated that there are about 10,000,000 acres of land in the five Gulf States well suited to rice culture, and that about 3,000,000 acres can be successfully irrigated. To provide good seed rice a company has recently been organized at Orange, Texas, and will operate a 4000-acre farm. A chemical investigation of the rice plant and the products and by-products of the rice industry has been made by the South Carolina experiment station. The successful use of rice for silage has been reported from Queensland, Australia. Queensland produced about 4 per cent. of the rice consumed in that country, and the future prospects of the rice industry there are considered encouraging.

As reported by the division of foreign markets, Department of Agriculture, the imports of rice into the United States in 1902 amounted to 75,674,776 pounds (valued at \$1,596,210), and of rice flour, rice meal and broken rice 81,984,118 pounds (valued at \$1,330,711). The exports of rice were 615,036 pounds (valued at \$29,707), and of rice bran, meal and polish 28,976,238 pounds (valued at \$228,010).

ROACH, WILLIAM NATHANIEL, ex-senator from North Dakota, died September 7, 1902, in New York City. He was born September 25, 1840, in Washington, D. C., and was educated at Georgetown University. During the Civil War he was a clerk in the quartermaster's department. In 1879 he removed to Dakota, where he got government mail contracts, and established some good mail roads over that thinly settled territory. He then took up land and engaged in

farming. From 1885 to 1887 he was mayor of Larimore, and in 1885 was also a member of the Territorial legislature. He twice received the Democratic nomination for governor after North Dakota had become a State, and in 1893 was elected to the United States Senate. As the leader of the delegation from North Dakota in 1896, he supported William Jennings Bryan at the Democratic national convention.

ROADS. See PAVEMENTS, STREETS AND ROADS.

ROBERTS-AUSTEN, SIR WILLIAM CHANDLER, assay master of the British mint and professor of metallurgy in the Royal School of Mines since 1880, died in London, November 22, 1902. He was born in 1843 and was educated as a mining engineer at the Royal School of Mines, and on his graduation he was appointed to the scientific staff of the British mint. In 1869 he was made assayer and in 1882 assay master, with all the scientific work of the mint under his control. Professor Roberts-Austen was well known among metallurgists as an authority on alloys, and he took an important part in the various researches on alloys of a committee of the Institute of Mechanical Engineers. He devised a photographic recording pyrometer and carried on many researches on iron and steel. He prepared an important paper on the action of projectiles and explosives on gun tubes, and this, as well as his other researches, was well illustrated by microphotographs which he had prepared. As a consulting expert he served the government on numerous occasions when called upon to consider some scientific or engineering problem, and was made a C.B. in 1890 and K.C.B. in 1899. He was president of the Iron and Steel Institute (1899-1901), and was a fellow (1875) and member of the council of the Royal Society, as well as an honorary member of the leading engineering societies, and at one time vice-president of the Physical Society of London, of which he was one of the founders. He wrote *An Introduction to the Study of Metallurgy*.

ROCHAMBEAU STATUE, DEDICATION OF THE. An event that gave an opportunity for the semi-official expression and re-affirmation of friendship between the world's two greatest republics occurred at Washington, D. C., May 24, 1902, on the occasion of the dedication in that city of the statue of the Marquis de Rochambeau, commander-in-chief of the French forces that rendered such valuable aid to the American cause in the siege and capture of Yorktown during the War for Independence. The statue itself, which stands in Lafayette Square, is a replica of the memorial designed by Ferdinand Hamar and unveiled at Vendôme, the birthplace of Rochambeau, in 1899. A mission sent by President Loubet, at the head of which was General Brugère, commander-in-chief of the French army, took part in the exercises. Representatives of both the Rochambeau and Lafayette families were present, and the statue was unveiled by the hand of the present Marquise de Rochambeau. The dedicatory exercises were officially attended by the President's cabinet, and addresses were made by M. Cambon, the French ambassador; General Brugère, Senator Lodge of Massachusetts, and Gen. Horace Porter, United States ambassador to France.

ROMAN CATHOLIC CHURCH. The year 1902 in the Catholic Church was remarkable especially for the opening of the papal jubilee, the creation of the pontifical commission on Biblical studies, and for the negotiations between the Vatican and the United States in regard to the situation in the Philippines. The enforcement of the Associations law in France, and the anti-clerical movement in Spain and Portugal also elicited general interest.

On March 3 occurred the celebration marking the inauguration of the papal jubilee, the twenty-fifth year of the pontificate of Leo XIII. having begun on February 20. This event, particularly noteworthy since only two other popes—St. Peter, according to tradition, and Pius IX.—have reigned so long, was commemorated in all lands by Roman Catholics. Congratulatory messages were received by the Pope, and many pilgrimages were made to Rome throughout the year. Three encyclicals were issued by Pope Leo in 1902. The first, on "the evils of modern society and their remedies," the so-called testament of His Holiness, was dated March 19. It treated of socialism and anarchy, of atheism and freemasonry, and condemned divorce laws, the proposed divorce legislation in Italy being responsible for the reference to divorce. The encyclical on the "Holy Eucharist," published on May 28, completed the series on the Divine Redeemer and the sacred heart. On October 30 was issued the letter on the study of the Scriptures, formally establishing the papal Biblical commission and defining the scope of its work. Thorough study in the light of modern research and positive interpretation of the Scriptures, with the maintenance of the absolute authority of the Bible, were the guiding instructions laid down. The creation of this commission, early in 1902, was considered of great importance, inasmuch as it recognized the influence of higher criticism, by some regarded as the outcome of the denunciation to the Vati-

THE ROCHAMBEAU STATUE, Washington, D. C.

can of the liberal views of Dr. Alfred Loisy. Cardinal Parocchi was named as the head of the commission, which is composed of two other cardinals as "assessors," Rev. David Fleming as secretary, and "consultors" from various countries, Dr. Charles P. Grannan, of the Catholic University in Washington, being the American representative. During 1902, the Sacred College lost by death Cardinals Ciasca, Dell' Olio, Ledochowski, Aloisi-Masella, Missia, Riboldi, and Schlauch. (For the cardinals of the Church, see **CARDINALS**.) Cardinal Ledochowski was succeeded as prefect of the propaganda by Cardinal Girolamo Maria Gotti (*q.v.*). This appointment was of special interest to the United States, which is a missionary country under direct control of the propaganda. Other important appointments were Mgr. Diomede Falconio, formerly apostolic delegate in Canada, as apostolic delegate in the United States; Mgr. Donatus Sbarretti as apostolic delegate in Canada, and Mgr. Guidi as apostolic delegate in the Philippine Islands.

United States.—The Roman Catholic Church is the oldest, as well as the largest, Christian denomination in the United States. The Catholic population in the United States and its possessions is estimated at 18,853,951. Of this total 11,289,710 are in the United States and 6,565,998 in the Philippines. The churches in this country number 10,878, and the priests, 9743 of the secular clergy and 3225 clergy of religious orders. There are 14 archbishops, one of whom is a cardinal, and 86 bishops. The educational interests of the church are represented by 7 universities, and 71 seminaries with 3382 students; 3978 parish schools with 963,683 pupils. There are 923 charitable institutions. Serious losses in the episcopate were sustained in the death of Archbishop Corrigan of New York and of Archbishop Feehan of Chicago. The Rev. John M. Farley, auxiliary bishop of New York, was nominated to succeed Archbishop Corrigan. Rt. Rev. J. B. Pitaval was appointed auxiliary bishop to the archbishop of Santa Fé, and Rt. Rev. George Montgomery coadjutor to the archbishop of San Francisco; Very Rev. Philip J. Garrigan became bishop of Sioux City, Ia.; Rt. Rev. William J. Kenny, bishop of St. Augustine; Rev. James J. Keane, bishop of Cheyenne, and Very Rev. J. N. Stariha, bishop of Lead City. In the United States several notable jubilees were celebrated during 1902. Bishop Spalding celebrated his episcopal silver jubilee, and Cardinal Gibbons his archiepiscopal silver jubilee; Archbishop Ryan celebrated the thirtieth anniversary of his consecration as bishop. Archbishop Ryan came into public notice also through his appointment by President Roosevelt on the Board of Indian Commissioners. The golden jubilee celebration of the Passionist Fathers in the United States was held late in December. Educational matters occupied a prominent place in the history of 1902. A department of pedagogy in connection with the Catholic University of America was opened on October 1 in St. Francis Xavier College, New York City; and the project of a seminary for home and insular missions is well under way. The seminary, which is to be known as the Apostolic Mission House, is located in Washington, D. C. Liberal subscriptions have been received for its buildings and endowment. The Catholic Winter School held its seventh annual session February 15 to March 3, in New Orleans; and the Catholic Summer School was in session from July 6 to September 5 at Cliff Haven, N. Y. The fourth annual conference of Catholic colleges in the United States was held in Chicago, July 9 and 10. The convention of the American Federation of Catholic Societies in Chicago, August 5-7, was of note as the first meeting of the completely organized federation. The Catholic Total Abstinence Union held its convention in August, at Dubuque, Iowa. There has been considerable discussion of the movement on the part of the Catholics of this country to get from under the control of the propaganda which directs affairs in the United States, as it is a missionary country. The Pious Fund case, involving funds of the Roman Catholic Church, was carried by Mexico and the United States to the International Court at The Hague, which rendered decision in favor of the United States. See **ARBITRATION**, **INTERNATIONAL**.

The Philippines.—The most important event of the year 1902 in connection with the Philippines was the conference between Governor Taft and the Vatican. The negotiations were conducted with cordiality and conciliation, and were generally successful in preparing the way for the final details to be arranged in Manila. (See **PHILIPPINES**, paragraph **Monastic Orders**.) The movement under Gregorio Agilpay, an excommunicated native priest, resulting in the establishment of an Independent Catholic church, has assumed considerable proportions. The church was formally instituted on October 27. A riot in Manila was caused by the forcible seizure of a church by followers of the new church, who claimed the property on the ground that the church had been built on public lands and by popular subscription. Agilpay in a memorial to Governor Taft laid claim to the cathedral of Manila.

Europe.—In France, interest was centred during 1902 in the enforcement of the Law of Associations, which was attended by great tumult. (See **FRANCE**, paragraph **Associations Law**.) The Church was outspoken in its hostility, and no little

criticism of the policy of the French government was expressed by disinterested parties. The other side of the question was presented with equal vigor. The houses of the religious orders from France that settled in Switzerland were closed, according to an article of the Swiss constitution which prohibits "the foundation of new convents or religious orders, or the re-establishment of those which have been suppressed." The situation in Spain also is critical. (See SPAIN.) There are, according to government statistics, 3115 religious communities, comprising 50,933 members, nearly all of which applied for the required authorization. The reform movement contemplates also a reduction in the clerical budget, through the disestablishment of several church jurisdictions. The government regulations of Portugal concerning religious orders are very strict, and have been received with much opposition. The "Los von Rom" movement in Austria is rapidly gaining, according to its advocates, the accessions being made by both the Protestant and Old Catholic churches. The Roman Catholic episcopacy issued a pastoral letter warning their constituents against the movement. There is said to be, in contrast with the away-from-Rome agitation, a liberal movement in the Catholic churches of Austria, Germany and France which aims at reform of the church from within, not by separating from it. Better education of the priesthood and less dogmatism, with greater recognition of the results of higher criticism, form the basis of this movement. See AUSTRIA-HUNGARY (paragraphs Pan-Germanism and "The Los von Rom" Movement).

Missions.—An interesting report in English was issued from Baltimore in 1902 by the Society for the Propagation of the Faith. This society, which is distinct from the Congregation de Propaganda Fide, was organized in Lyons, France, in 1822 for the support of missionaries. It received from 1822 to 1900 total contributions amounting to \$65,690,017, of which more than \$42,000,000 came from France and her colonies. This money was distributed as follows: America, \$9,973,916; Europe, \$9,799,854; Asia, \$25,932,446; Africa, \$8,815,953; Oceania, \$6,011,630; special gifts sent to missions, transportation and traveling expenses of missionaries, publications, and management of the society, \$5,156,218. There are some 65,000 persons engaged in missionary work, and the number of missions aided by the society is several hundred. More missions are maintained in Asia than on any other continent.

RÖNTGEN RAYS IN MEDICINE. The X-rays as a therapeutic and diagnostic agent received widespread attention during 1902, and many new uses were found for them in both capacities. Among the diseases in which they have been employed are cancer, sarcoma, sycosis, various forms of dermatitis, hypertrichosis, favus, eczema, psoriasis, acne rosacea, prurigo, herpes tonsurans. They have also been used to remove superfluous hair. As a means of diagnosis they have proved useful in fractures of the bones, in differentiating osteomyelitis, osseous cyst, osteosarcoma and other bone lesions. In the soft tissues they have been employed to determine the limits of cardiac dullness (that is, the position of the heart in relation to the chest wall); in the diagnosis of the various stages of pulmonary tuberculosis, the limits of pneumonia, and other lung lesions; in the diagnosis of aneurism of the aorta; and even, it is claimed by one observer, to demonstrate the presence of a tumor at the base of the brain. Foreign bodies can be located in almost any part of the body, and this is sometimes very useful when an object has been swallowed, or drawn into the windpipe, or lodged, as in the case of a bullet, in the brain. Radioscopy of the abdomen is very difficult, on account of the continual movement of the intestines. This can be obviated in some degree by giving opium. It is not possible to diagnose by the X-rays in this part of the body the presence of an abscess, hydronephrosis, or malignant tumor, but renal calculi can often be detected, and sometimes gall stones when they contain calcium carbonate. The method is also useful in recognizing diseases of the spinal column. Dr. William A. Pusey sums up the present status of the Röntgen ray treatment as follows: (1) It is painless; (2) it destroys diseased tissue but leaves healthy tissue in its place; (3) it leaves small scars; (4) it can be used in cases in which the surrounding healthy tissue cannot be sacrificed; and hence is available for cases in which ordinary methods involve extensive operations and subsequent disfigurement, as in lesions about the eye and nose; (5) it is also available when the usual methods are impossible on account of the amount of tissue necessary to be removed; (6) it often relieves pain. In general, it is probably advisable to limit the use of the X-rays to cases which it would be impossible to treat by ordinary methods, except perhaps cutaneous cancer. The bactericidal effects of the Röntgen rays have been tested by Dr. H. Rieder, of Germany. He noted the effects of the rays on cultures of the cholera vibrio, and the bacillus prodigiosus and bacterium coli. The cultures were covered with a lead sheet with a central opening and held very near to the tube. A distinct bactericidal effect was noted in all experiments, in from twenty to thirty minutes, which was, however, much less marked in fully developed than in immature colonies. The

investigator concludes that since conditions are so different in human bodies, and with sufficiently concentrated rays there is great danger of injuring the skin, little can be expected in the treatment of infectious diseases.

ROOD, **OGDEN NICHOLAS**, professor of physics in Columbia University, died in New York City, November 12, 1902. He was born in Danbury, Conn., February 3, 1831, and was educated at Yale and Princeton, graduating from the latter institution in 1852. After post-graduate studies at Sheffield Scientific School (Yale) he spent four years in European laboratories, especially those of the universities of Munich and Berlin. On his return to America in 1858, he accepted a professorship of chemistry and physics in Troy University, where he remained until 1863, and was called to Columbia College in 1864. In the same year he was elected a member of the National Academy of Sciences. Devoting himself to the experimental side of physical study rather than to abstruse mathematical investigation, by great manipulative skill and refinement of method he was able to push his investigations to extremes never before realized. As an authority on light and more particularly on color, he enjoyed a unique reputation, and his work on *Modern Chromatics* (New York, 1879), and his many papers published in the *American Journal of Science* have been widely read. In addition, he carried on important researches in photography, microscopy, acoustics, ballistics, the duration of electric sparks and lightning flashes, and the stereoscope; and in each field he contributed one or more important papers to scientific publications. In 1880-81 he devised an improved form of Sprengel mercury air-pump, with which he was able to secure a far higher vacuum (almost one four-hundred millionth) than had previously been attained, which remained the best achievement in the way of high vacua until within a few years. More recent work by Professor Rood included studies on physiological optics entitled *A Color System* and *A Photometric Method Independent of Color*, using in this latter investigation the so-called Flicker photometer. This apparatus he also successfully adapted to the study of color-blindness. Like many other physicists, Professor Rood's attention was directed to the investigation of Röntgen ray phenomena, and he was able to show the regular, or specular, reflection from polished metal surfaces.

ROOKWOOD, first Baron, Sir **HENRY JOHN SELWIN-IBBETSON**. See **SELWIN-IBBETSON**.

ROQUE, by which name the American variation of croquet is known, attracted to its twenty-first annual tournament, held at Norwich, Conn., August 18-25, 1902, the largest number of competitors in the history of the game. The tournament, which was held under the auspices of the National Roque Association, was played in three classes, in which there were, respectively, 18, 16 and 11 contestants. The championship of the first division was won by S. L. Duryee, of Washington, D. C. (also champion in 1897), with 15 victories and 2 defeats; second, W. H. Wahley, Washington, with 14 victories and 3 defeats. In the second division, W. Hoge-land, Philadelphia, was first, with 13 won, 2 lost; and H. Duryee, Washington, was second, with 13 won, 3 lost. In the third division, A. C. Robinson, of Punxsutawney, Pa., was first, and C. W. Hale, Cottage City, Mass., was second. S. L. Duryee, by defeating G. C. Cox, Malden, Mass., in 4 out of 5 games, retained the Van Winkle Badge.

ROUMANIA, a constitutional monarchy of southeastern Europe. The capital is Bucharest.

Area and Population.—The kingdom comprises 32 departments, the aggregate area of which is estimated at 50,720 square miles. According to the preliminary returns of the census of December, 1899, the population was 5,912,520, of whom 92.5 per cent. were Roumanians, 2.9 per cent. foreigners, and 4.6 per cent. "aliens not under foreign protection," that is, Jews. Bucharest, the largest city, had 282,071 inhabitants. At the end of 1901 the estimated population was 6,081,572. The predominating religion is the Orthodox Greek. Education is in a backward condition.

Government.—The executive power is vested in the king, who is assisted by a ministry of eight members responsible to the lower house of the parliament. Parliament consists of the senate (120 members) and the chamber of deputies (183 members), all members being elected by popular vote. The sovereign in 1902 was Charles I., son of the late Prince Karl of Hohenzollern-Sigmaringen; he was born in 1869, elected lord of Roumania April 20, 1886, and proclaimed king March 26, 1881. The heir presumptive is Prince Ferdinand, nephew of the king, born in 1865.

The peace strength of the regular army is 3280 officers and about 60,000 men, while the territorial army numbers about 72,000 men. The war strength is about 174,000 officers and men. The navy is small, but is increasing in strength; it includes a small protected cruiser, about a dozen gunboats and coast-guard vessels, and 8 torpedo boats.

Finance.—The monetary unit is the leu, worth 19.3 cents. For the fiscal year 1900 the revenue and expenditure are reported at 200,083,576 lei and 235,488,486 lei, respectively; for 1901, 210,042,758 and 237,286,775, respectively. The budget estimates for the fiscal year 1903 balanced at 218,500,000 lei. The largest items of revenue were indirect taxes, 56,510,000 lei; state monopolies, 50,900,000; direct taxes, 43,615,000; ministry of agriculture, 23,345,000; of public works, 22,520,000; of the interior, 10,534,000. The largest estimated expenditures were for the debt, 86,441,092 lei; ministry of war, 37,720,000; of finance, 34,823,000; of public instruction and worship, 24,924,000; of the interior, 15,259,000. On March 31, 1901, the public debt amounted to 1,432,015,515 lei, and on March 31, 1902, 1,413,339,384 lei. About half of the debt has been contracted for railways.

Industries, Commerce, etc.—The principal industry is agriculture, and the leading crops are wheat and corn. In 1900 wheat production reached 19,967,900 hectolitres, and corn 29,970,400 hectolitres. (The hectolitre equals 2.838 bushels.) Wheat production in 1901 reached 25,508,840 hectolitres; barley, 8,535,925; oats, 5,828,550; rye, 3,373,650. Mineral industries are little developed, though coal, petroleum, and salt are mined to some extent. The beet sugar industry has recently gained in importance. The value in lei of imports and exports have been as follows:

	1898	1899	1900	1901
Imports.....	389,008,430	333,267,935	216,985,878	292,435,760
Exports.....	288,287,869	149,119,657	280,000,431	353,880,877

The leading imports in 1900 were textiles, etc., 141,900,000 lei, and metals and metal-ware, 47,800,000 lei. The most important export was cereals, 245,800,000 lei (172,700,000 lei in 1900). Imports from and exports to the countries of greatest trade importance in 1901 were, respectively: Germany, 84,320,000 lei and 39,468,000 lei; Austria-Hungary, 71,407,000 and 49,135,000; Great Britain, 56,426,000 and 24,439,000; Italy, 21,832,000 and 18,025,000; France, 18,801,000 and 9,848,000; Turkey and Bulgaria, 13,145,000 and 19,634,000; Russia, 6,320,000 and 6,284,000; Switzerland, 5,104,000 and 1,275,000; Belgium, 5,097,000 and 174,539,000.

Roumanian railways are owned by the state; in 1901 there were 2060 miles in operation and 930 miles projected or under construction. The telegraph lines in 1900 aggregated 4344 miles, with 11,246 miles of wire.

HISTORY.

Internal Affairs.—The policy of retrenchment initiated by the Sturdza ministry in the early part of 1901, and necessitated by the depressed condition of national industry and finance was pursued throughout 1902. The opposition accused the government of practicing unwise economy in reducing the expenditure for the operation of the railways, thus tending to make the service inefficient and travel dangerous. Dissensions within the ranks of the Liberal party were apparent in the early part of the year, when the minister of finance, Pallade, laid down his portfolio, under pressure, it was thought, of the prime-minister Sturdza (January, 1902). The latter, however, did not develop sufficient strength to risk a breach with the older wing of the Liberals, and in July a reconstruction of the ministry took place. The personnel of the new cabinet is as follows: President of the council and minister of war, Sturdza; interior, Pallade; justice, Statesco; public works, Stoicesco; public instruction and worship, Haret; foreign affairs, Bratiano; finance, Costinesco. Upon the new minister of foreign affairs seems destined to fall the leadership of the Liberal party, from which Sturdza is said to be contemplating retirement.

Secretary Hay's Note.—The condition of the Jews in Roumania was the subject of a circular note addressed by Mr. John Hay, secretary of state of the United States, on September 17, 1902, to the signatory powers of the Treaty of Berlin (1878). It has been the policy of the Roumanian government to regard the Jews as aliens, in spite of the fact that a large proportion of them have resided for hundreds of years in the country. In doing so the government has succeeded in evading the terms of the Treaty of Berlin dealing with the affairs of the newly constituted state, which declared (Article xlv.), that the difference of religious creeds shall not be made a disqualification for civil or political rights, eligibility to public office, or the exercise of any trade or profession in any locality. As a matter of fact, out of the more than 300,000 Jews in Roumania a very small number (estimated by some at about 100) have received the rights of naturalization from the chambers. Laws passed at various times exclude the Jews ("aliens") from the learned professions, from the public service, and from many other occupations. They are not permitted to own or lease land for agricultural purposes, or to carry on the trades of bakers, grocers, or innkeepers in rural districts. In those trades that are open to Jewish laborers a Roumanian employer may hire only one Jew for every two Roumanians. The colleges and secondary schools are closed to

Jewish students and the elementary schools are open to them only after all Roumanian children have been accommodated and on the payment of a fee. Anti-Jewish legislation culminated in March, 1902, in a law dealing with the organization of trade unions by the terms of which the Jews would be practically excluded from the exercise of the mechanic trades, almost the only source of livelihood left to the vast majority. Such a state of affairs has led to a large emigration to England and the United States.

In his note Secretary Hay declares that the treatment of the Jews by the Roumanian government is of interest to the United States in that by far the greater portion of those whom persecution has driven from Roumania have found a home or have attempted to settle in this country. While welcoming the voluntary immigration of all aliens who are mentally and physically fit for the duties of citizenship, the United States cannot admit as members of the community "the pauper, the criminal, the contagiously or incurably diseased. . . . The voluntary character of their coming is essential; hence we shut out all immigration assisted or constrained by foreign agencies. The purpose of our generous treatment of the alien immigrant is to benefit us and him alike—not to afford to another state a field upon which to cast its own objectionable elements." Mr. Hay then refers to the clause in the Treaty of Berlin mentioned above, and proceeds to enumerate the oppressive measures of the Roumanian government by which "the ability of the Jew to earn even the scanty means of existence that suffice for a frugal race has been constricted by degrees until nearly every opportunity to win a livelihood has been denied, and until the helpless poverty of the Jew has constrained an exodus of such proportions as to cause general concern." The result of this has been the invasion of the United States by a class of immigrants who, "made double paupers by physical and moral oppression" become a burden and a menace to the community. Interference by our government is thus justified: "The United States offers asylum to the oppressed of all lands. But its sympathy with them in no wise impairs its just liberty and right to weigh the acts of the oppressor in the light of their effects upon this country and to judge accordingly. . . . Whether consciously or not these helpless people burdened and spurned by their native land are forced by the sovereign power of Roumania upon the charity of the United States. This government cannot be a tacit party to such an international wrong. . . . The United States may not authoritatively appeal to the stipulations of the Treaty of Berlin, to which it was not and cannot become a signatory, but it does earnestly appeal to the principles consigned therein, because they are the principles of international law and eternal justice."

The note aroused much discussion in Europe, presenting as it did in tone and purpose such a marked departure from ordinary diplomatic communication. The consensus of opinion was that because of the determined position of the Roumanian government little could be effected in the way of bringing about any amelioration in the condition of the Jews. Coercion was deemed out of the question at a time when the renewal of the Triple Alliance and premonitory warnings in the Balkans made any tampering with the political balance precarious. The press of Great Britain was warm in its commendation of the spirit of the note, while expressing its doubt as to the practicability of bringing effective action to bear on Roumania. In Germany and Austria the tone of the press was in general hostile to the interference of the United States in a matter regarded as of purely European interest. The Monroe Doctrine was invoked as a cogent reason for the United States to confine its attention to cis-Atlantic interests, and the more outspoken of the journals did not hesitate to apply the *tu quoque* argument in the matter of lynch-law and other heinous crimes. The Roumanian government attempted some defense by pointing to the decree of September, 1902, mitigating the operations of the law of March, but as a matter of fact the essential disabilities under which the Jewish laborer suffered were not removed and a large emigration of skilled workers set in toward the end of the year.

ROWING, in 1902, maintained its position as one of the leading sports among the colleges and clubs of the United States, although there was no one event of particular importance. The "American Henley," so long exploited, was made to seem more probable by the formation of the American Rowing Association, having for its object the consummation of the scheme. The favorable reception of the plans submitted gave assurance that before another year ended, the first attempt to hold a regatta modeled after the English event, would be made. At the regatta of the Intercollegiate Rowing Association, held on the Hudson River at Poughkeepsie, June 21, Cornell won in all three classes. In the 'varsity eight-oared race, 4 miles, the results were as follows: First, Cornell, by 3 lengths, 19 minutes 53-5 seconds; second, Wisconsin, by 1¼ lengths; third, Columbia, by 2½ lengths; fourth, Pennsylvania, by ¾ length; fifth, Syracuse, by ¼ length; and sixth, Georgetown.

In the four-oared race, 2 miles, Cornell won from Pennsylvania by 2 lengths, in 10 minutes 43 seconds, with Columbia third. Cornell was less than a length ahead in the freshman eight-oared race (two miles), and won in 9 minutes 39.4-5 seconds. The other crews in their order were Wisconsin, Columbia, Syracuse and Pennsylvania. The annual Yale-Harvard races at New London, Conn., occurred on June 25-26. Yale won the 'varsity 4-mile event by $3\frac{1}{2}$ lengths in 20 minutes 20 seconds and the freshmen (2 miles) rowed a dead heat at 10 minutes 13 seconds. Harvard won both the 'varsity and freshman four-oared events, the former (2 miles) in 11 minutes $19\frac{1}{2}$ seconds, and the latter ($\frac{1}{2}$ mile) in 2 minutes 40 seconds.

The regatta of the National Association of Amateur Oarsmen was held at Worcester, Mass., on August 8-9, the various events being won as follows: Association single sculls, J. B. Juvenal, Philadelphia; intermediate single sculls, E. George, Boston; championship senior single sculls, C. S. Titus, New York; intermediate pair-oars, Harlem Rowing Club, New York; senior pair-oars, Vesper Boat Club, Philadelphia; intermediate double-shells, Boston Athletic Association; senior double shells, Bohemian Boat Club, New York; intermediate four-oared shells, Ariel Rowing Club, Baltimore; senior four-oared shells, Winnipeg Rowing Club, Manitoba; international four-oared shells, Winnipeg Rowing Club; intermediate eight-oared shells, Pennsylvania Barge Club, Philadelphia; senior eight-oared shells, Vesper Boat Club, Philadelphia.

Abroad at Putney, March 22, Cambridge defeated Oxford in their annual 4-mile race by 8 lengths, in 19 minutes 9 seconds. The only American entered in the Henley regatta, July 7-9, was C. S. Titus, the national champion single sculler, who competed in the Diamond Sculls event, emblematic of the world's championship. In the third round he was defeated by F. S. Kelley, of Balliol College, Oxford, who finally won the event, in 8 minutes 39 seconds.

ROYAL, JOSEPH, a Canadian journalist and politician, died on August 23, 1902. Born at Repentigny, Quebec, May 7, 1837, he was educated at the Jesuit College of St. Mary's in Montreal, and after journalistic experience on the staff of *La Minerve*, established *Le Nouveau Monde* in 1857, *L'Ordre* in 1859, and assisted in founding the *Revue Canadienne* in 1864. In the same year he was admitted to the bar, and from that time until 1880 continued in active legal practice. Elected in 1870 to the first Manitoba legislature, he retained his seat until 1879, at which time he entered the House of Commons. He was appointed to the lieutenant-governorship of the Northwest Territory in 1888, which post he held until 1893. In 1893 he became editor-in-chief of *La Minerve* at Montreal. He was known as a skillful advocate, a legislator particularly interested in matters of education, an exponent of Canadian political independence, and the writer of several interesting pamphlets on public affairs. He was elected to membership in the Royal Society of Canada in 1893.

ROYER, CLÉMENCE AUGUSTE, a Frenchwoman distinguished for her studies in the natural sciences and philosophy, died in February, 1902. She was born April 30, 1830, at Nantes, of a Catholic royalist family. She spent most of her childhood abroad, and began early to devote herself to the studies in which she afterwards became famous. In 1859 she established a course for women in logic and philosophy at Lausanne, which was afterwards extended to other cities. In 1862 she published *Théorie de l'impôt ou la dîme sociale*, an essay that had divided with Proudhon, the disparager of intelligence in women, the prize offered in a public competition in Switzerland. She also contributed to the Swiss paper *Le Nouvel Economiste*. Her real reputation, however, was established by her translation of Darwin's *Origin of Species*, which she prefaced with a critique of the ultimate result of the theory of evolution, one of the most famous essays in contemporaneous French thought. She published *Origine de l'homme et des sociétés* (1869), *Les rites funéraires aux époques préhistoriques* (1876), *Le bien et la loi morale* (1881), *La Constitution du Monde* (1900). Among articles that she contributed to the leading French papers are: *Sur la Fondation d'un collège international réaliste*; *Sur l'Avenir de Turin*; *Sur le Percement de l'isthme américain*; *Le Lac de Paris*. She was awarded the cross of the Legion of Honor in 1900.

RUBBER. The increasing demand for rubber for manufacturing has caused considerable activity in the rubber regions of South America, which include the valleys of the upper Amazon and its tributary streams. From here comes the greater part of the rubber consumed in the United States and Europe, and new districts are being continually developed as the regions (especially the islands) of the lower river are becoming exhausted. The most promising new districts are the Acre territory and southeastern Ecuador. It is believed that the rubber forests about the many tributaries of the Amazon are practically unlimited. Bolivia, Ecuador, and Peru are now attracting the rubber gatherers on account of the fewer legislative restrictions there. The gathering of rubber is an industry entirely in the

hands of natives or residents, and it has not been feasible hitherto for the large manufacturing companies to take a hand in its collection. During 1902 it was asserted that the United States Rubber Company had subscribed largely to the stock of a company formed to exploit rubber-gathering in the Acre district, and the result of this slight entering of a manufacturing company into the business of collecting the raw material is awaited with interest. Conditions in Acre, however, are most uncertain. (See BOLIVIA.) For the rubber production of the Amazon valley in 1900, see BRAZIL (paragraph Industries and Commerce). As showing the development of the rubber industry in South America, the following table, giving the production in metric tons for six successive years, is of interest:

YEAR.	To United States.	To Europe.	Total.
1896-1897.	9,848	12,368	22,216
1897-1898.	11,422	10,796	22,218
1898-1899.	12,398	12,848	25,246
1899-1900.	12,474	14,407	26,881
1900-1901.	15,194	12,486	27,680
1901-1902.	14,066	15,931	29,997

The United States enjoys a large export trade in manufactures of rubber, which during the calendar year 1902 aggregated \$3,815,754, as against \$3,326,016 in 1901. The principal item of this export business is rubber boots and shoes, but hose, belting, packing, and other articles figure to a large extent. Great Britain is the chief customer for American rubber goods, her yearly takings exceeding a value of one million dollars.

While gutta-percha is quite distinct from India rubber, it has a certain relation on account of being used for a number of similar purposes. Attention is now being paid to the balata tree, which grows in Brazil along the Amazon River. The balata, or bulle tree (Minsaps balata) has long been a source of gutta-percha in the Guanas and the valley of the Orinoco, but these trees have been exhausted. The industry was extremely profitable, though it requires experienced men to bleed the trees and collect the sap. One man, however, can produce in a day as much gutta-percha as twenty men can extract rubber, each collector or bleeder being able to produce between 40 and 50 pounds of gutta-percha.

RUNKLE, JOHN DANIEL, an American educator, died at South West Harbor, Maine, July 8, 1902. He was born in Root, Montgomery County, N. Y., October 11, 1823, and, after graduating from the Lawrence Scientific School of Harvard in 1851, was appointed to the staff of the *American Ephemeris and Nautical Almanac*, a post which he held until 1884. He established in 1858 the *Mathematical Monthly*, which he edited until its publication was discontinued in 1861, and was one of the founders of the Massachusetts Institute of Technology, of which he was acting president from 1868 to 1870, and president from 1870 till 1878. As Walker professor of mathematics, he directed that department from the opening of the institution, except when occupied with the duties of president, and was professor emeritus at the time of his death. It was through his efforts that the laboratory system was instituted and the consequent advance in the work of mining and metallurgy made possible. Influenced by the plans of the Moscow Imperial Technical School, exhibited at the Centennial Exposition of 1876, he established the department of mechanic arts, which was greatly aided at its foundation by the Czar of Russia. Besides many articles and addresses upon educational topics, he published *Elements of Plane Analytic Geometry* (1888).

RUSSELL, SOL SMITH, an American comedian, known for his quaintly artistic impersonations, died in Washington, D. C., April 28, 1902. He was born in Brunswick, Me., June 15, 1848, was a Union drummer-boy from the outbreak of the Civil War until 1864, and then at Cairo, Ill., left the troops to play the orchestra drum, sing, and take unimportant parts in a small theatre. Subsequently he passed from town to town, singing, playing on various instruments, and reciting monologues; acted, chiefly in low-comedy rôles, in St. Louis and Cincinnati; and in association with the Berger bell-ringers gave songs and impersonations. From lyceum entertainment he turned to the drama, in 1874 became a member of the Augustin Daly organization, and first appeared as a star in 1880, in *Edgewood Folks*, presented upwards of 1500 times. His talents were restricted, most nicely adapted to parts combining the whimsical and the gentle, and shown to best advantage in E. E. Kidder's *A Poor Relation* and *Peaceful Valley*, especially written for him. With the former of these he was commonly identified. His delicate and highly-finished art resulted in an apparent ease and simplicity. He won a large and distinct clientele, was known as a happy curtain-speaker, and occupied a high place in the estimation of the American theatre-going public. In Minneapolis, where he resided, he was also esteemed as a public-spirited citizen.

RUSSIA, an empire in Europe and Asia comprising one-seventh of the land surface of the globe. The capital is St. Petersburg.

Area and Population.—The total area is stated at 8,660,394 square miles, of which 2,095,616 are in Europe and 6,564,778 in Asia. According to the census of February 9, 1897, the population of European Russia (including Finland), was 106,264,136, and of Asiatic, 22,697,469—total, including 42,909 Russians in Finland, Bokhara, Khiva, and in the navy abroad, 129,004,514. There were 89,606,106 Orthodox Greeks, 13,889,421 Mohammedans, 11,420,227 Roman Catholics, 6,213,237 Protestants, 1,224,032 other Christians, and 5,189,401 Jews. St. Petersburg has about 1,500,000 inhabitants, and Moscow over 1,000,000.

Government.—Russia is an absolute hereditary monarchy, of which the whole executive, legislative, and judicial power is vested in the czar, or emperor. The emperor in 1902 was Nicholas II., who was born May 18, 1868, and succeeded his father, Alexander III., November 1, 1894. The heir-presumptive was the Grand Duke Michael, born December 4, 1878. The administration of the empire is intrusted to four boards, or councils, whose members are appointed by and are responsible to the emperor. These boards are: (1) The council of state (reorganized in 1901), whose principal function is that of a consultative body on legislative matters; (2) the senate, by which all new laws must be promulgated, and which is also the supreme court of justice of the empire; (3) the holy synod, which has entire control of ecclesiastical affairs; (4) the cabinet ministers. In 1902 the principal ministers were: Count V. N. Lamsdorff, foreign affairs (appointed in the fall of 1900); Vyacheslav K. de Pleve, the interior (appointed April, 1902); Gen. A. N. Kuropatkin, war (appointed December, 1897); Vice-Admiral P. P. Tyrtoff, navy (appointed July, 1896); Sergius J. de Witte, finance (appointed in 1892); N. V. Muravieff, justice (appointed in 1893); Dr. G. Sanger, public instruction (appointed April, 1902); Count Sergius Schermetieff, procurator of the holy synod (his appointment in November, 1902, to take effect at the beginning of 1903); A. S. Yermoloff, agriculture (appointed in 1893).

The empire is divided into 79 governments, or provinces, some of which are united into general-governments; all are administered, under the emperor, by governors and their subordinates, holding office through imperial appointment. In local affairs there is some degree of popular autonomy.

Religion and Education.—The established church, of which the emperor is the head, is the Græco-Russian, officially known as the Orthodox-Catholic Faith. Practically the head of the church is the procurator of the holy synod. All religious bodies, with the exception of the Jewish, may receive state aid.

For the most part the educational system is under the control of the minister of public instruction, but numerous specialistic schools are under other departments. In 1898 the elementary schools in the empire numbered 78,699 with 4,193,594 pupils, of whom 3,136,163 were males. The estimated enrolment in the middle schools, including technical, agricultural, etc., is 260,000, and in the universities 16,500.

Army and Navy.—All able-bodied males, with a few exceptions in the case of certain professional men, are liable to military service from their twenty-first year. The Russian army is the largest in the world. The peace strength of the active army in 1902 was stated as follows: Infantry, 24,176 officers and 726,811 men; cavalry, 5171 officers and 127,772 men; artillery, 5978 officers and 171,585 men; engineers, etc., 1307 officers and 33,912 men; total, including others not classified above, 38,412 officers and 1,076,458 men. The war strength is approximately 75,000 officers and 4,500,000 men. The military budgets for 1901 and 1902 amounted to 324,024,871 and 322,638,538 rubles respectively. See MANŒUVRES.

Russia maintains three separate fleets—one in the Black Sea, where by international agreement it must stay, one in the Baltic, and one, the largest and most important, in the Pacific and the China Sea; in addition there are squadrons in the White and Caspian seas. Exclusive of non-effective craft, training ships, etc., the completed vessels of the Russian fleet and those building or provided for, respectively, were stated to be as follows in March, 1902: First-class battleships, 2 and 7; second-class battleships, 15 completed; third-class battleships, 2 completed; cruisers (armored, protected, or belted), 15 and 9; coast-defense vessels, 7 and 1; gunboats, old armor-clads, and armored gunboats, 46 and 2; destroyers, 21 and 13; first-class torpedo boats, 45 and 6; in addition there were 41 second-class and 101 third-class torpedo boats, a few small gunboats on the Caspian, and 50 submarine boats afloat or projected. The naval complement is over 40,000 officers and men. The naval budget for 1901 amounted to 93,597,666 rubles, 98,318,984 rubles for 1902, and 104,417,791 rubles for 1903.

Finance.—The monetary standard is gold and the unit of value the ruble, worth 51.5 cents. For 1900 revenue and expenditure balanced at 1,889,216,137 rubles. Ordinary revenue amounted to 1,704,128,506 rubles, extraordinary revenue 32,568,983 rubles, and the additional revenue raised to meet the extraordinary expenditure

152,518,648 rubles. Ordinary expenditure was 1,555,427,622 rubles, and extraordinary expenditure 333,788,515 rubles. The total estimated revenue and expenditure for 1901 balanced at 1,788,482,006 rubles, and for 1902 1,946,571,976 rubles. For 1901 the ordinary estimated revenue and expenditure amounted to 1,730,096,006 rubles and 1,656,652,556 rubles respectively; for 1902, 1,800,784,482 rubles and 1,775,913,481 rubles respectively. For the latter year the chief sources of ordinary revenue were estimated to yield the following amounts: State monopolies, 521,724,000 rubles; state domains, 508,414,998; redemption of land, 86,431,000. The largest estimated expenditures (ordinary) for 1902 were: Communications, 435,547,758 rubles; finances, 335,198,430; war, 322,638,537; interest on the public debt, 258,816,418; navy, 98,318,984; department of the interior, 98,187,205. There was an estimated extraordinary expenditure of 165,658,495 rubles for the construction of new railways and railway equipment. The total public debt on December 31, 1901, is reported at 6,497,300,000 rubles.

Industries and Commerce.—Russia is preëminently an agricultural country and more than three-fourths of the inhabitants subsist by tillage of the soil. Nearly 37 per cent. of the soil in Russia is owned by the state and the imperial family, 35 per cent. by the peasants, and 28 per cent. by landed proprietors and towns. The leading products are rye, barley, wheat, oats, buckwheat, and millet. Rye is the great staple of the country, the annual production varying from 750,000,000 to 950,000,000 bushels. The cultivation of flax is an important industry and provides one of Russia's leading articles of export. Though primitive methods of farming prevail over large areas, progress in the methods of scientific cultivation has been furthered by government and private initiative. In 1902 there were 68 experimental farms under the ministry of agriculture. Russia, including Poland, Finland, and the Caucasus, has 550,000,000 acres of forest, 64 per cent. of which in European Russia is owned and cared for by the state. There are extensive mineral deposits both in European Russia and in Siberia. The iron-smelting industry in the Urals is increasing rapidly, the output amounting to 797,000 tons in 1900 and to 2,807,972 in 1901. Petroleum, however (in the Batum-Baku districts), constitutes the most important mineral product, and the industry is advancing with giant strides from year to year. Russia now produces about 35 per cent. of the total output of the world, and has entered into formidable competition with the United States in the Asiatic market. Though manufactures are still in their infancy, Russia may be said to have entered upon an era of important industrial development. Foreign capital, Belgian and French especially, has found a profitable field in the country. With the development of manufactures there has been a great increase in the urban population, especially in the Baltic provinces, Poland, and parts of southern Russia. The result has been a state of affairs not unlike that felt prevailing in England after the industrial revolution—the sudden rise of villages into large towns with the consequent increase of disease, crime, and immorality due to lack of sanitation and the close herding of the working population. The industrial development has also been the cause of important political development, in that it has given rise to a large urban proletariat whose struggle for the improvement of their economic and political condition has been the cause of grave anxiety to the government.

In 1901 the imports were valued at 523,288,000 rubles, as compared with 572,496,000 rubles in 1900. The exports, on the other hand, increased from 688,552,000 rubles in 1900, to 729,565,000 rubles in 1901. The chief articles of import, in the order of their value, are: Machinery, cotton, tea, oil, metal, manufactures, gums, wine, soap, chemicals, and iron. The leading commodities exported are cereals and other grains (more than 40 per cent. of the total exports), timber, flax and flaxseed, petroleum, eggs, and sugar. The foreign commerce, in rubles, in 1901 was distributed as follows, the first figures representing imports to Russia, the second, exports from Russia: Germany, 200,218,000 and 179,413,000; Great Britain, 103,219,000 and 156,316,000; Netherlands, 8,751,000 and 84,628,000; France, 26,852,000 and 61,200,000; United States, 64,688,000 and 3,986,000; Austria-Hungary, 23,685,000 and 30,270,000; Italy, 10,424,000 and 37,911,000; Belgium, 8,412,000 and 20,965,000; Denmark, 4,738,000 and 29,914,000; Turkey, 7,309,000 and 21,349,000. In 1901 food-stuffs constituted 60 per cent. of the exports and raw products 35 per cent.

Communications.—At the beginning of 1902 there were in Russia 30,142 miles of railway, of which 18,505 miles were owned by the state, 10,577 miles by private companies, and 1060 miles by local communities. (For the Trans-Siberian Railway, see SIBERIA; and for the railway across Turkistan from Orenburg to Tashkent, see CENTRAL ASIA, RUSSIAN.) In 1900 there were 102,397 miles of telegraph line with 308,450 miles of wire, two-thirds of the wire mileage being the property of the state. The number of post-office stations in 1900 was 6029. The cost of operating the state system of posts and telegraphs was 142,435,000 rubles, and the gross receipts were 276,553,000 rubles.

HISTORY.

Student Outbreaks.—The situation in Russia during 1902 was characterized by semi-revolutionary outbreaks and widespread agricultural and industrial depression. In the early part of the year the disorders among the students were renewed, and the student participants were joined by the discontented peasantry. The discontent among the students was occasioned by the stringent restrictions upon a hitherto fairly wide academic liberty. Both professors and students demanded a return to the former liberal régime, the students in particular insisting upon the right of forming associations according to the German custom. A series of encounters took place between students and workmen on the one side and the police and military authorities on the other, resulting in the death or injury of a large number of the participants on both sides. The disturbances were met by the adoption of vigorous measures on the part of the government. Several of the universities, notably those of Kieff, Kharkoff, and St. Petersburg, were closed, while some twenty cities and towns, in which there are higher educational institutions, were placed under semi-military control. Many of the students were expelled from the universities and drafted into the military service, while many others together with their coadjutors were arrested and imprisoned or banished to Siberia, or other remote places. From the universities the discontent spread to the masses, so that students and workmen came to make common cause against the government. In fact, the two movements became merged, so that in many communities it was difficult to tell whether a given disturbance was caused by the students aided by the working classes or *vice versa*. Some of the most notable of these occurrences took place at Moscow and St. Petersburg in March. As a result of the disturbances at Moscow it was reported that 95 students were exiled and 500 more sent to prison at Archangel. In June the czar addressed a rescript to M. Sânger, the minister of education, expressing the earnest hope that the students would obey the law and cease their disturbances. In the course of the rescript he said: "For the sake of the nation intrusted to my care an end must be put to the disorders which are a disgrace to science and to the universities, once the just pride of Russia, and which cause the ruin of so many young lives dear to the fatherland and to me." In August the czar ordered the liberation of the students imprisoned for participation in the disturbances at Moscow in March. During the course of the year provision was made for disciplinary courts to be established for all the high schools under the jurisdiction of the minister of education. The courts are to be composed of university professors and will judge all cases of disturbances in the high schools between students and professors as well as various student offenses.

Agrarian Disturbances.—The unrest among the laboring classes was accentuated by the existing political régime and the general economic depression, which in some localities amounted to actual impoverishment. The chief seat of the agrarian disturbances was the central portion of Russia—the "Black Earth" region. Here grain is the chief staple, but on account of the decrease in the productivity of the soil barely more than enough could be produced by the peasants to pay taxes, which in recent years have been increased. In many cases they were compelled to sell the grain intended for seed in order to comply with the government demands. In May whole districts of central Russia were reported as famine-stricken. As a result of hunger and destitution an epidemic of scurvy broke out, 6815 cases being reported in the villages of the Minzelinsk district on April 14, as against 2723 cases reported on March 14. The unrest and destitution soon began to manifest itself in strikes, riots, disorders of various kinds, and murderous attacks upon officers of the government. In April serious riots broke out in Kharkoff, Poltava, and adjacent districts, being precipitated by a forged proclamation of the czar purporting to authorize the distribution of lands among the peasants. Thousands of peasants took the field in disorderly masses, drove the landed proprietors to the towns, attacked and plundered their estates, fought with sticks and stones the troops sent to disperse them, and terrorized the population generally. They were finally dispersed, but not until many had been killed or wounded. On May 1 the whole labor population in the district between Moscow and Vladimir was reported to be in revolt and martial law was proclaimed in five districts of Poltava. At Rostoff on July 1 a crowd of workmen broke into several manufacturing establishments, destroyed the machinery, and plundered the people of the community. The rioters were fired upon by the soldiery and many were killed.

The opposition to the repressive measures of the government manifested itself in frequent attacks upon the higher officials, who were regarded as chiefly responsible for the distressing condition of the peasantry. Early in April an attempt was made to assassinate the chief of the Moscow police. This was followed on the fifteenth of the same month by the assassination of M. Sipiaguin, minister of the interior, while he was entering the Marinski Palace, St. Petersburg, to attend a meeting of the committee of ministers. The assassin was one Balmasheff, who the year before had

been punished for participation in the disturbances at Kieff, where he was a student at the university. Sipiagin was regarded as the embodiment of the spirit of reaction and had upheld a policy of vigorous coercion in dealing with the outbreaks. He was succeeded by M. de Plehve, secretary of state for Finland, a distinguished official, who is believed to sympathize with the ideas of his predecessor. On May 19 an attempt was made to assassinate General von Wahl, governor of Vilna, who, it was reported, had been condemned to death by the Central Revolutionary Committee for cruelties, that had been perpetrated on political prisoners as a result of his instructions. He escaped with only slight wounds in his left hand and right foot. On August 11 Prince Obolensky, governor of Kharkoff, was fired upon in the Tivoli Gardens, and received several bullet wounds. He was an object of hatred to the peasantry on account of his activity in suppressing riots among the peasants and for the commendation he had received from the czar for his services in this connection. The assassination of the minister of the interior was followed by the resignation of General Vannovsky, the minister of education, appointed to succeed Bogoliefoff, who was assassinated February 27, 1901. Vannovsky's resignation was attributed to the failure of his efforts to secure educational reform and to win the students from their revolutionary agitation.

As a means of temporary relief to the peasantry the czar issued an order on June 15, 1902, remitting arrears of taxes to the amount of 25,000,000 rubles. As compensation for the landed proprietors of Kharkoff and Poltava who suffered losses on account of the disturbances mentioned above, a grant of 800,000 rubles was made from the imperial treasury.

Industrial Crisis.—In September, 1902, an industrial crisis was reached in Russia and the collapse of many large industrial undertakings was reported, particularly in the south and southeast. Strikes of workmen occurred in many places, thus increasing the seriousness of the situation. In November it was reported that 4500 workmen employed in the shops of the Vladikavkas Railway at Rostoff-on-Don ceased work, demanding shorter hours, a higher wage, and the dismissal of some of the managers. Their action, however, was not attended by any disturbance. The strikers were informed that their demands could not be considered and they were requested to resume work, but under the incitement of a socialist, democratic, and labor committee they refused to work and continued to hold meetings. A body of Cossacks attempted to disperse them, and one officer and nine men were wounded. Finally the strikers were fired upon by the Cossacks and a number were killed and wounded. The workmen at Ticharetzkoja station struck on November 28, 1902, advancing the same demands as the Rostoff men. Refusing to disperse they were attacked by a body of Cossacks and two of their number killed, 19 being wounded; 102 strikers were arrested. On December 24 the condition of the families of the Rostoff strikers was reported to be pitiable in the extreme. Thousands who were dependent upon them were described as being on the verge of starvation. About the same time bread riots were reported from the Ural districts, where thousands of persons were idle on account of the closing of the iron works.

The Grimm Incident.—An incident of note in connection with Russian military affairs was the discovery early in 1902 that the plan of attack agreed upon between Russia and France in a secret military convention and to be followed by the two powers in case of hostilities with Germany had become known to Germany through collusion on the part of some member of the military intelligence bureau at Warsaw. Colonel Grimm, a trusted officer, was suspected of selling the plans to Germany and was arrested. After the evidence against him became indisputable, he made a full confession, and upon trial by court martial was condemned to degradation from his rank, sentenced to twelve years penal servitude in the mines of Sakhalin, and, should he survive, to pass the remainder of his life in some village of Siberia north of Irkutsk. It was estimated that the changes in the fortifications etc., made necessary by his treachery would cost the Russian war department about 11,000,000 rubles.

Agricultural Committees.—Toward the end of the summer of 1902 the government instituted a movement for the study of the causes of the agricultural depression by the appointment under the direction of M. Witte, finance minister, of local agricultural committees to investigate and report upon the needs of agriculture. These committees set to work to collect material for the central committee under the presidency of M. Witte and drew up a long list of social, financial, and even constitutional reforms, which they considered to be necessary for the improvement of the agricultural situation. They condemned the bureaucratic system, and in fact the entire social and political condition of Russia and asserted that the financial policy of the government was opposed to the true interests of the country and especially of the rural population. They charged M. Witte with encouraging a "hot-house industry" at the expense of agriculture and with imposing needless burdens of indirect taxation, which fall with especial severity upon the peasantry. In

regard to agricultural improvement, the committees took the ground that reform could not be attained through technical measures or measures for the encouragement of particular branches of production, but that the chief remedy lay in a more equitable system of taxation and in the development of general education. Late in December it was announced that notable reforms would soon be undertaken.

Royal Visits.—During the summer of 1902 the czar was the recipient of visits from several European sovereigns. The first of these was the visit of President Loubet, of France, accompanied by M. Delcassé, in May. They were received on board the yacht *Alexandra*, May 20. They then proceeded to Peterhof and St. Petersburg. Their reception was notably cordial. In July the czar received, at Peterhof, the king of Italy, accompanied by his foreign minister, Signor Prinetti. It was reported that several matters of international interest, such as disarmament and the Balkan question, were discussed. On August 6, the czar received the German emperor at Reval where they witnessed a series of manœuvres of the Russian fleet.

Other Affairs.—In July the Russian government through M. Witte, the finance minister, proposed to the signatory Powers of the Brussels Sugar Convention that the whole subject of illegitimate international competition be discussed by the several governments concerned. To this proposal there was no favorable response, and M. Witte then suggested that the Powers come to a mutual agreement by which tariffs should be increased on trust-made goods.

The elaborate programme of M. Witte for the encouragement of Russian shipping interests deserves mention. His scheme provides for subsidizing the Russian volunteer fleet and to grant it exemptions from taxation and other privileges on condition that it maintains a regular traffic between Russia and the Far East, and complies with certain rules prescribed by the government. The government, furthermore, agrees to advance a liberal amount for construction, maintenance, and insurance provided certain conditions with reference to the use of Russian fuel and the carriage of Russian products are observed. An incident of European international interest was the passage through the Dardanelles to the Black Sea in September, of four Russian torpedo boat destroyers. The Porte remonstrated that the act was in violation of treaty obligations as well as the public law of Europe. The Russian government, on the other hand, defended its action on the ground that the vessels were not destroyers at the time they passed through the straits because they flew the commercial flag and had no armament. RUTE, MARIE STUDEHOLMINE BONAPARTE RATAZZI DE, a French woman of letters, died February 6, 1902, at Paris. She was born about 1830 at Waterford, Ireland, and was the daughter of Sir Thomas Wyse, former British ambassador at Athens, and of Lætitia Bonaparte, the eldest daughter of Lucien Bonaparte. In 1850 she married Frédéric de Solms, a rich Alsatian, who obtained a separation from her when her political views resulted in her exile from Paris. She did not return until 1860, and in the meantime lived in Savoy and at Nice, and founded a journal, *Les Matinées d'Aix*, to which she contributed a quantity of verse and prose. She was one of the first women journalists. After her return to Paris she contributed to *Le Constitutionnel*, with which Sainte Beuve was then connected, and to *Le Pays* and *Le Turf*. She became a figure in the artistic and literary world, and attracted to her salon the most brilliant men of the Second Empire, including Hugo, Rochefort, Lamennais, Sue, and About. In 1863 she married the Italian statesman Urbain Ratazzi, who died in 1873. Besides writing many novels, she founded *Le Courrier de Florence* and *Les Matinées italiennes*, to which she contributed under various pseudonyms, among the best known of which were "Baron Stock" and "Louis Kelner." In 1877 she married M. de Rute, a deputy to the Spanish Cortes. *Les Matinées espagnoles* now took the place of *Les Matinées d'Aix*. She was better known to the public as a figure in literary circles than as an author. During the last few years of her life she edited *La Nouvelle Revue Internationale*. Among her books are: *Le Mariage, ou l'Avenir du Portugal* (1862); *Les Mariages de la Créole* (1864); *Le Piège aux Maris* (1865); *La Mexicaine* (1866); *Le Chemin de Paradis* (1867); *Les Soirées d'Aix-les-Bains*, in prose and verse (1865); *Nice la Belle* (1870); *l'Ombre de la Mort* (1875). In 1881 she edited *Ratazzi et son Temps*, a tribute to the part her husband played in Italy.

RYE. This cereal gave a high yield per acre in the United States in 1902, which made the total production larger than that of any previous year. The total acreage was nearly 2,000,000 acres, and the aggregate production was 33,630,592 bushels, valued at \$17,080,793. Although one of the minor crops of this country, its cultivation is very widely distributed. Pennsylvania and Wisconsin produced the largest amounts—about 6,000,000 bushels each; the other leading rye-growing States were Nebraska, New York, Michigan, Minnesota, Illinois, Iowa, New Jersey, and Kansas,

in the order named. The average yield was 17 bushels per acre, as compared with 15.3 in 1901, 15.1 in 1900, and 14.4 in 1899.

The world's production of rye in 1901, as compiled by the United States Department of Agriculture, was 1,448,072,000 bushels, against 1,594,019,000 bushels in 1900 and 1,616,997,000 bushels in 1899. Russia, the largest rye-producing country, furnished 754,925,000 bushels of the 1901 crop; Germany, 321,350,000 bushels; Austria-Hungary, 120,521,000 bushels; France, 62,366,000 bushels; Japan, 35,000,000 bushels; and the United States, 30,345,000 bushels. The 1902 crop in Russia is estimated at 919,000,000 bushels, an increase of nearly 22 per cent. over the previous year, and nearly 15½ per cent. in excess of the five-year average. Final returns for the other principal rye-growing countries are not yet available.

The exports of rye from the United States during the fiscal year ended June 30, 1902, are reported as follows:

COUNTRIES.	Bushels.	Value.	COUNTRIES.	Bushels.	Value.
Germany.....	918,198	\$559,018	Denmark.....	170,894	\$106,337
United Kingdom.....	650,567	381,431	Canada.....	167,880	95,043
Belgium.....	552,945	293,756	Other countries.....	24,984	14,602
Netherlands.....	212,395	131,304	Total.....	2,697,863	\$1,581,491

There were practically no imports of this grain, the few bushels reported probably being for seed.

SABIN, DWIGHT MAY, a former senator from Minnesota, died in Chicago, Ill., December 23, 1902. He was born in Manlius, Ill., April 25, 1845, but removed to Minnesota in his youth. In 1871 he entered the State legislature, where he remained until he became United States senator in 1883. From 1878 to 1884 he was a member of the National Republican Committee, and was its chairman from 1882 to 1884. During his term as senator he was a member of the committee on Indian affairs, and was chairman of the committee on railroads. He retired from public life in 1889 and engaged in extensive lumbering and railroad operations in Minnesota.

SAINT ANDREW, BROTHERHOOD OF, a society in the Protestant Episcopal Church, founded in 1883 for the spread of Christianity among young men. Since its organization, the Brotherhood has established 1714 chapters, 1167 of which are now active. Of these, 659, with 7152 members, were reported at the seventeenth annual convention, which was held in October, 1902, in Boston. In the Junior Department, reports were made by 239 chapters, having more than 3000 members. The total receipts by the Brotherhood office were \$18,479. In 1903 the convention will meet in Denver, Col. The official organ of the order is the *St. Andrew's Cross*. Organizations similar to the Brotherhood of St. Andrew are found in Anglican churches in various parts of the world. President, H. D. W. English; general secretary, Hubert Carleton; headquarters, Pittsburgh, Pa.

ST. CHRISTOPHER, or ST. KITTS. See LEEWARD ISLANDS.

ST. LOUIS EXPOSITION. See LOUISIANA PURCHASE EXPOSITION.

ST. LUCIA. See WINDWARD ISLANDS.

ST. VINCENT, one of the British Windward Islands, has an area of 132 square miles, and a population (1901) of 47,548. Kingston, the capital, has a population of 4547. The revenue and expenditure in 1901-02 were respectively £26,612 and £29,572. The imports show a decline from £96,191 in 1900 to £74,919 in 1901, and the exports, consisting largely of sugar, coffee, spices, and rum, a decline from £97,768 to £51,987 in the same period.

Eruption of La Soufrière.—After a long period of quiescence the volcano La Soufrière burst into violent activity on May 7, 1902, the day preceding the outbreak of Mont Pelée. Steam, hot ashes, and lapilli were ejected from the crater in enormous quantities. About one-third of the total surface of St. Vincent was buried beneath the rock fragments or subjected to the withering effects of steam which rolled in great clouds down the volcano's sides. The loss of life (officially estimated at 1350) was comparatively small, as there was no thickly populated area like St. Pierre, within reach of the devastating forces; many passed through the storm unscathed, while several hundred were injured more or less severely by the hot ashes. At Georgetown, the largest town in the vicinity of the volcano, the buildings were crushed and otherwise damaged, but no fatalities were reported. The small loss of life was doubtless due in part to the fact that the inhabitants took timely warning from the preliminary rumblings and removed to the more remote districts. In 1718 there had been a terrific explosive eruption which covered the whole island with volcanic débris. A second and more devastating outbreak occurred in 1812, and

resulted in the formation of a new crater; it was characterized by dense clouds of smoke and ashes ejected with greater force, perhaps, than was exhibited in 1902.

Sequence of Events.—It is not known definitely when La Soufrière first gave warning of approaching activity. As far back as April, 1901, earthquakes became noticeably frequent in St. Vincent, and in December of that year rumblings were heard from the direction of the mountain. In April, 1902, the indications assumed a more pronounced form. In anticipation of the outburst many of the people living on the west coast abandoned their homes. This region was regarded as particularly dangerous owing to the easterly winds which it was thought would carry the ejecta westward from the crater; but subsequent events showed that the destructive agencies accomplished their work equally well on the eastern side of the island. The first visible sign of activity according to E. O. Hovey (*The National Geographic Magazine*, December, 1902) was observed in the afternoon of May 6, when puffs of steam and smoke began to rise from the crater. Light eruptions occurred after short intervals of quiescence during the evening and with increasing intensity throughout the night. The next morning the volcano was playing almost continuously, sending out great smoke clouds which rose five or six miles in the air; while lightning flashed across the column and thunders mingled with the roar from the fiery furnace. At two o'clock in the afternoon of May 7 the volcano had developed its full energy. Dense masses of steam and ashes hung over the mountains, completely hiding the summit and sending out horizontal blasts that swept over the land with tornadic violence. The shower of red-hot stones was irresistible. Rock fragments six inches in diameter were thrown to a distance of five miles from the summit. Within a brief time the entire northern part of St. Vincent was covered with a gray mantle a foot or more thick, and every vestige of the luxuriant foliage had disappeared. The eruption continued with unabated vigor during the rest of the day, and then gradually subsided. On May 18 there was a brief period of activity, which was followed on September 3 by an outburst almost as destructive as the first.

The Devastated Area.—The region laid waste by the eruption comprised practically the entire northern portion of the island within a southern limit that is distant about six miles from the crater. Over this area measuring about 46 square miles, a layer of volcanic dust and lapilli was spread to a depth of several feet, the heaviest accumulations being in the stream valleys which lead down from the mountain to the sea. At Georgetown, on the eastern coast, over five miles in an air line from the summit, the ash mantle was about two feet thick, and this may be taken as the minimum limit in northern St. Vincent. The valleys of the Rabaka Dry River on the east side and of the Wallibu, Trespé, and Rozeau on the western slopes were almost completely filled with débris. At Kingston on the southern coast, 12 miles from La Soufrière, the streets were covered to the depth of an inch. Wallibu and Richmond villages lying west of the volcano suffered complete annihilation, the former by a landslide which carried it into the sea, and the latter by the heavy fall of dust ranging from five to twenty feet in thickness. In the city of Georgetown the roofs and windows were shattered and the streets were obstructed by heaps of ashes and stones.

Phenomena of the Eruption.—One of the peculiar features of the volcanic activity was the steam blasts which swept down from the crater. They were not localized like the hurricane that visited St. Pierre, but extended radially and followed the slopes of the mountain on all sides. Their effects were witnessed principally in the uprooting and breaking of trees, and in the displacement of heavy timbers and stonework. The steam was heavily charged with dust which, moving with great velocity, acted like a sand-blast, scouring exposed cliffs and curving the roots of trees into fantastic shapes; it was sufficiently hot to wither and char all vegetable matter with which it came in contact. There is little doubt but that these horizontal blasts were due to an expansion of the vertical column either owing to the pressure of the superincumbent mass or to the great density of the heavily dust-charged steam.

No molten lava was ejected from the volcano. The solid material consisted of angular rock fragments varying in size from the finest dust to masses several feet in diameter and weighing many tons. All of the rock material was highly heated, but owing to its refractory (andesitic) nature it hardened before leaving the volcanic conduit; for the same reason also there were no true volcanic bombs such as are found in the ejecta of Vesuvius and Mauna Loa. In some instances the fragments were partially fused when thrown into the air and assumed a rudely spherical form, but there was not sufficient plasticity to develop the spirally twisted projections which mark the typical volcanic bombs. The explosive nature of the eruption and the absence of lava flow are in accordance with the general principle to which volcanoes of this character conform. As the molten material is forced upward into the chimney away from the central heat it becomes rigid and imprisons the accom-

panying gases and vapors until by expansion or explosion the latter develop such force as to shatter the lava plug and to throw the fragments out of the crater.

The largest quantity of stones and ashes fell on the eastern slopes of the mountain, where also the greatest loss of life occurred. The apparent feeling of security among the inhabitants of this region previous to the eruption illustrates the futility of attempting to forecast the effects of volcanic cataclysms. When the outburst attained its greatest violence the cloud of ejecta rose through the region of the atmosphere influenced by the easterly trade winds into the upper air currents which transported the material to windward; dust fell in large quantities as far east as the island of Barbados, 90 miles from St. Vincent, and its presence was reported by ships at localities 275 miles distant.

There were heavy mud flows in the stream channels leading down from the mountain. A torrent of mud and boiling water was brought down by the Rabaka Dry River shortly before the great outburst on May 7, which resembled the flood that rushed down the Rivière Blanche near St. Pierre. It may have been due to the overflow of the crater lake through which the volcanic ejecta passed out of the crater. The filling of the stream valleys with hot lapilli and dust gave rise to secondary eruptions simulating the effects of true outbursts. When the interior of the mass was reached by percolating waters clouds of dust-laden steam were thrown up with explosive violence, the display sometimes lasting for an hour or more.

Causes of Deaths.—The fatalities, according to Dr. Hovey, were due to the following causes: (1) Asphyxiation by hot, dust-laden steam and air; (2) burns by hot stones and dust; (3) blows inflicted by falling materials; (4) nervous shock; (5) burning by steam alone; (6) lightning strokes. The first cause is illustrated in the cases of people who took refuge in cellars where they were protected from falling stones but not from the vapors and gases. It seems probable that noxious gases were present in the steam, increasing the deadly effect of the latter, for both sulphur dioxide and sulphureted hydrogen were observed in the lighter eruptions that followed the principal outburst. In some instances the bodies of the victims were burned while the clothing apparently showed no signs of charring—facts indicating the agency of steam. There is no reason for assigning lightning as a cause except that the eruption was accompanied by vivid electrical displays.

For the eruption of Mont Pelée, see MARTINIQUE.

SALISBURY, third Marquis of, ROBERT ARTHUR TALBOT GASCOYNE-CECIL, premier of Great Britain, who resigned his office in July, 1902, had attained, both in general and critical estimation, the distinction of being one of the ablest British statesmen of the last half century. He was born at Hatfield, February 3, 1830, was educated at Eton and at Christ Church, Oxford, and in 1853 was elected to Parliament in the Conservative interest for Stamford. During his fifteen years' membership he manifested in regard to domestic questions the adherence to high Tory notions and traditions which has marked his entire career, and which made to the modern democratic spirit only such concessions as were necessary. Both as a parliamentary speaker and as a writer for the *Saturday Review* and the *Quarterly* he made an enviable record, and in 1866 was appointed secretary of state for India in Lord Derby's administration, but, viewing with doubt some parts of Mr. Disraeli's Reform Bill of 1867, he resigned office in that year. On the death of his father in 1868 he succeeded to the marquise and extensive landed estates. In 1874 he again held office as secretary for India, and was soon placed in charge of important negotiations concerning the Eastern question, then acutely revived by the Bulgarian atrocities and by the danger of Russian interference against Turkey. Having been made special ambassador to the Porte, he contended for a joint guaranty by the Powers for the protection of the Slav populations of the Balkan provinces, so that they might not come under the control of Russia. Unsuccessful at Constantinople, he returned to England, and, after the Russo-Turkish war of 1877, went with Lord Beaconsfield as a plenipotentiary to the Congress of Berlin in 1878, at which the severe terms imposed by Russia on Turkey in the Treaty of San Stefano were reconsidered and nullified. In the same year he became secretary for foreign affairs, an office subsequently held by him in connection with the premiership. In 1881, after the death of Lord Beaconsfield, he was chosen leader of the Conservative party. He was twice premier during 1885-86, and afterwards in 1886-92 and 1895-1902. During his two later administrations domestic policy demanded less attention than foreign affairs, for which field Lord Salisbury was best equipped. Between 1895 and 1902 British foreign policy changed in two important respects, not only by its share in shifting the central difficulty of European diplomacy from Constantinople to China and the Far East, but by its promotion of better relations with the United States. In both these changes Lord Salisbury was the leading personal factor. His yielding of the Venezuelan difficulty to arbitration and his circumspect firmness as well as patience during the recent troubles in China, have had good results. The former strengthened the moral ties between Great Britain and the

United States, while the latter maintained in the East a position in which British trade prospects and political prestige are preserved. Lord Salisbury, while manifesting no one quality of political leadership in a very marked degree, has been deemed safe and commanding by virtue of his mental breadth and foresightedness; moreover, while often pliable on lesser issues, he has always been inflexible on great ones. In his leisure moments he has been devoted to science, especially electricity, and he is chancellor of the University of Oxford. He was succeeded as premier by Arthur James Balfour (*q.v.*).

SALT. See MINERAL PRODUCTION.

SALVADOR, the smallest American republic, lies on the Pacific coast, south of Guatemala and Honduras. The capital is San Salvador.

Area and Population.—The area of Salvador, according to a recent planimetric calculation, is 8135 square miles. According to the census of March 1, 1901, the population was 1,006,848, of whom 234,648 were Indians. The remainder were classified as "whites," though most of them are mestizos. There were 493,893 males and 512,955 females. The populations of the principal towns were: San Salvador, 59,544; Santa Ana, 48,120; San Miguel, 24,768; Nueva San Salvador, 18,768; San Vicente, 17,892; Sonsonate, 17,016; Zacatecoluca, 15,130. The prevailing religion is Roman Catholicism. Primary instruction is free and nominally compulsory.

Government and Finance.—The executive authority is vested in a president, who is elected for a term of four years and is assisted by a cabinet of four members. The legislative power devolves upon a congress of deputies. The president, in 1902, for the term ending March 1, 1903, was General Tomás Regalado. The regular army is reported to number 4000 men.

The monetary standard is silver and the unit of value the peso, worth 42.8 cents on October 1, 1901, and 38.4 cents on October 1, 1902. Revenue and expenditure in the fiscal year 1900 amounted to 6,337,729 pesos and 6,751,028 pesos, respectively. In 1901, according to the president's message to the congress (May 1, 1902), the revenue was 6,556,722 pesos and the expenditure 7,640,891 pesos; of the revenue, customs duties amounted to 4,168,564 pesos. Budget estimates for the fiscal year 1903 show revenue 5,931,420 pesos and expenditure 6,937,748 pesos.

The total public debt was reported to amount to 9,350,368 pesos at the end of 1900 and 8,325,904 pesos at the end of 1901.

Production, Commerce, etc.—The most important products are coffee, sugar, and indigo. In 1901 the coffee crop amounted to 55,600,000 pounds; the 1902 crop was estimated at 40,000,000 pounds. In 1900 imports were valued at about 6,000,000 pesos and exports 9,132,958 pesos. In 1901 imports were valued at 2,615,151 pesos gold, or 6,537,877 pesos silver with exchange at 150; the exports amounted to 10,956,045 pesos, of which 8,308,466 pesos represented coffee. Nearly a half of the coffee export is sent to France, and something less than a sixth to the United States and to Germany. The leading imports include cotton goods, alcoholic liquors, iron and steel wares, and flour.

In 1902 the general industrial and commercial condition of Salvador seemed quite satisfactory, a condition due largely to the confidence placed in the able administration of General Regalado. It seemed that for the best interests of the country Regalado should be renominated for the presidency, but, it was stated, he preferred to retire. During his administration "peace has been maintained, confidence restored, the finance of the country put on a better footing, the public schools have multiplied, and new industries, both public and private, have been established throughout the land." A compulsory arbitration treaty between Salvador and Spain was signed at San Salvador September 26, 1902.

SALVATION ARMY, an organization, dating from 1865, which conducts religious and philanthropic work among the masses. Founded in London as the "Christian Mission," the Salvation Army adopted its present name in 1878, a complete military organization having been effected by that year. It has spread rapidly, and at the present time the Army is found in Great Britain, France, Switzerland, Holland, Belgium, Scandinavia, Denmark, Finland, Germany, Italy, Canada and Newfoundland, the United States, Japan, India, Ceylon, Java, Australia, South Africa, Barbados, Jamaica, and South America. In 1880 operations were begun in the United States, where now the Army maintains 670 corps and outposts with 3024 officers and employees. The scope of its work is indicated in the following statistics: Annual expenditures for poor relief, \$300,000; 210 social relief institutions with 787 officers and employees in charge, 69 workmen's hotels, 6 women's hotels, 20 food depots, 28 industrial homes for the unemployed, 3 farm colonies, comprising 2800 acres, with 350 colonists, 5 employment bureaus, 16 second-hand stores, 20 rescue homes for fallen women accommodating 450 inmates, 3 children's homes, 4 day nurseries, 23 slum settlements in charge of 70 officers, and on the list of insti-

tutions visited, 45 prisons, 7 workhouses, and 29 hospitals. Some 3,000,000 beds are annually provided for the poor at the various institutions, and 200,000 persons are fed at the yearly Christmas dinner. The reports show 45,000 conversions annually. The English, German, Scandinavian, and Chinese *War Cry* and *Young Soldier* have 101,000 circulation weekly. The Salvation Army maintains international headquarters in London and headquarters for the United States at 120 West Fourteenth Street, New York City. The general and commander-in-chief is William Booth, London; the forces in this country are directed by Commander and Consul Booth-Tucker. The most noteworthy event of the year 1902 in the history of the Salvation Army in the United States was the extended tour of General Booth who lectured in a number of the larger cities. His arrival in this country, in some quarters greeted with warm commendation for the work of the organization which he commands, was the occasion in others of an attack on his "autocratic" rule, as evidenced by the withdrawal from the Army of several members of his family, two of whom this year joined the forces of John Alexander Dowie. See CHRISTIAN CATHOLICS.

SAMOAN ISLANDS, a group of about a dozen islands in the Southern Pacific ocean, 2800 miles southwest of Hawaii and 1800 miles northeast of New Zealand. They have an aggregate area of 1700 square miles and a population of about 38,000. The inhabitants, with the exception of about 500 Germans, English, and Americans, are Polynesian and nominally Christians. By agreement of Great Britain, Germany, and the United States in 1899, the islands are practically divided between the two latter countries. The German, or eastern portion of the group, includes the two largest islands—Savaii (area, 660 square miles; population, 12,500) and Upolu (area, 340 square miles; population, 16,600). The latter island contains Apia, formerly the capital and chief port of the former Samoan kingdom, now the seat of the German civil governor. The estimated revenues and expenditures of German Samoa (1902-03) were 441,000 marks, of which about 170,000 marks was provided for by an imperial subvention. Trade is in the hands of German, American, and British merchants, British shipping in 1901-02 forming about six-sevenths of all the tonnage trading in the islands. Owing to a decline in copra the year 1901 was not so prosperous as the preceding one. The total imports were valued at £69,655 as compared with £80,000 in 1900, and the exports at £35,760 as compared with £50,000 in 1900.

The American or western portion of the group has a total area of less than 100 square miles, and a population of about 6000. Tutuila, the principal island (area, 54 square miles; population, 3800), contains Pago-Pago, the only good harbor in the entire group. Manua is the only other island of any considerable size in the American portion. The islands are administered under the United States Navy Department by a naval officer acting as resident governor (Commander Uriel Sabree since 1901). The commerce is insignificant, although Tutuila is very fertile, and capable of high cultivation. During 1902 the question as to the status of the American islands arose, from the attempt by the American collector of customs at Honolulu to levy duties on Samoan imports from Tutuila. The matter was referred to the State Department, and Secretary Hay held that the islands were "American territory," but no final decision was rendered as to the question in dispute. William Blackcock, the American fiscal agent, has suggested a modification in the present system of government by which the naval commander shall be limited in the exercise of his purely naval functions to the naval station proper, while he shall exercise the powers of a civil governor in the rest of the islands. A naval order of Commander Sabree prohibiting the sale of "refreshments" was said to be killing the growing tourist trade in the islands. Some sort of representation in local affairs was suggested by Mr. Blackcock for both whites and natives.

The Arbitration Decision.—On November 17, 1902, it was officially announced simultaneously in Berlin, London, and Washington that King Oscar II. of Sweden and Norway had given a decision wholly in favor of Germany in her dispute with Great Britain and the United States, involving claims resulting from military operations conducted by the last named governments in the Samoan Islands in 1899. By the Tripartite Treaty of Berlin in 1890 the United States, Germany, and Great Britain entered into an agreement for joint responsibility for the maintenance of a monarchy in Samoa. The convention constituted the chief-justice of the islands—a foreigner—a practical king-maker in case of disputed succession, and bound the signatory powers to abide by his decision. In 1898 a dispute over the succession did arise, and the chief-justice at that time happened to be an American, W. L. Chambers, who decided against the claims of Mataafa, whom German influence in Samoa favored. Malietoa, in whose favor Chief-Justice Chambers decided, prepared to enforce his claims by force of arms and civil war resulted. The Germans, through the influence of Herr Rose, the German consul at Apia, refused

to accept the decision and more or less openly abetted the Mataafa faction. The British and American authorities accepted the decision without objection. Mataafa, backed by Herr Rose, established a provisional government at Apia, declared Chief-Justice Chambers deposed, and named a German in his place. In March, 1899, the United States cruiser *Philadelphia*, and the British ships *Porpoise* and *Royalist* landed Malietoa and his forces on the island of Upolu, supplied them with arms and ammunition, and on March 15 opened fire across Apia at the Mataafa forces. A landing party of British and American marines was fired upon by Mataafa, and Lieutenant Lansdale and Ensign Monaghan, of the United States Navy, and Lieutenant Freeman, of the British Navy, were killed. As a result of the action of the British and American naval forces claims for damages amounting to over \$300,000 were filed, and as no satisfactory settlement could be reached at the time of the partition treaty of 1899-1900, the adjustment was referred to the arbitration of King Oscar. In both England and the United States the decision was looked upon as extraordinary. The tripartite agreement of 1890 explicitly stated that questions of disputed succession should be referred to the chief-justice, and that upon his giving his decision "the signatory governments will accept and abide by such decision." In the face of this explicit statement King Oscar, however, declares: "We have found nothing in said general act [the tripartite agreement] or any subsequent agreement which authorizes one of the signatory powers, or a majority of them, to take action to enforce the conditions of the act, or to make the decisions of the chief-justice binding on the powers." Although there was a tendency to criticise the finding of King Oscar and in the United States it was freely declared that never again would this government agree to submit any question for decision to the sole arbitrament of a European monarch, there was no disposition either in the United States or England to refuse to accept the award.

SAMPSON, WILLIAM THOMAS, rear-admiral, U. S. N., and commander-in-chief of the American fleet that destroyed the Spanish squadron under Admiral Cervera off Santiago, Cuba, on July 3, 1898, was retired from active service for age, on February 9, 1902, and died at Washington, D. C., on May 5 following. He was born of Scotch-Irish parentage at Palmyra, N. Y., February 9, 1840, was appointed to the United States Naval Academy in September, 1857, and graduated at the head of his class in June, 1861. The Civil War had already begun when he left the academy, but, although he sought an appointment for active service, he was retained at the academy as an instructor. In June, 1864, he became executive officer of the ironclad *Patapsco*, of the Charleston blockading squadron, and was on board when that vessel was completely destroyed by a submarine torpedo, although he escaped unhurt. The remaining months of his war service were uneventful. Already promoted lieutenant while at the academy in 1862, he became lieutenant-commander in July, 1866. From 1865 to 1867 he was with the flagship *Colorado*, on the European station, from 1867 to 1871 at Annapolis as instructor, and from 1871 to 1873 again at sea, this time on the *Congress*. In 1874 he returned to the academy, being promoted commander in August of that year, and in 1879 was appointed to command the *Swatara* on the Asiatic station, where he remained until 1882. In that year he became temporarily superintendent of the Naval Observatory, and in September, 1886, was appointed superintendent of the Naval Academy, with the development of which his name is intimately connected. There he remained until 1890. Of his superintendency, Parke Benjamin, the historian of that institution, says: "When Commander Sampson's tour of duty at the Naval Academy ended, there remained little for anyone else to do, save to keep the standard of efficiency unimpaired." When, in 1890, the *San Francisco*, the first modern steel cruiser of the new navy, was put in commission, Sampson, who had attained the rank of captain in the preceding year, was assigned to her command, retaining it until 1892. In January, 1893, he was commissioned chief of the bureau of ordnance, and began what may be considered one of the most valuable periods of his career, and which continued until May, 1897. In this position he played a conspicuous and noteworthy part in the building of the new navy, and became recognized as one of the world's greatest authorities on ordnance. To Sampson more than to any one else was due the adoption of the superimposed turrets. Six days after the destruction of the battleship *Maine* in Havana harbor, February 15, 1898, he was appointed president of a naval court of inquiry to investigate the occurrence, and it was the finding of this court, that the *Maine* was destroyed by an outside explosion, that led to President McKinley's notable message of March 28. Sampson's long and varied service was rewarded by his appointment, on March 24, to the command of the North Atlantic squadron, for which Rear-Admiral Sicard had been incapacitated by ill-health. He was appointed acting rear-admiral on April 21, and attained the rank of commodore in line of promotion on July 3—the very date on which the long chase and blockade of Admiral Cervera's squadron culminated in its destruction by the ships under Sampson's command off Santiago, although Sampson himself was absent. After

WILLIAM THOMAS SAMPSON

the close of hostilities he served as a Cuban commissioner, was promoted rear-admiral on March 3, 1899, and in October following was assigned to the command of the Boston (Charlestown) Navy Yard, where he remained until September, 1901. The closing years of his life were clouded by the controversy between his friends and the supporters of Admiral Schley, over the question of the command of the American fleet at Santiago, the friends of the latter claiming that in Sampson's absence the credit of the victory fell to Schley. Before the findings of the Schley court of inquiry were made public, however, he was stricken with a mental malady, which eventually resulted in his death.

SAN CLEMENTE, MANUEL, ex-president of the republic of Colombia, died near Bogotá, on March 19, 1902. He was born about 1812, and did not attain political prominence in Colombia until after reaching an advanced age. He was elected president in 1898, but very soon afterward opposition began to be manifested against his government on account of his enforced absence from Bogotá by reason of advanced age and ill-health. Dr. Marroquin, the vice-president, was publicly requested to assume the government. After he did so, by the *coup d'état* of July 30, 1900, San Clemente retired to the village of Villeta, where, it was popularly supposed, he was kept a political prisoner. The aged captive did not renounce his rights, and partisans soon gathered round him, though they failed to accomplish anything in behalf of his liberation and return to power.

SANTO DOMINGO, or DOMINICAN REPUBLIC, occupies the eastern portion of the island of Haiti. It has an area of 18,730 square miles, and a population officially estimated in 1888 at 417,000, consisting largely of mestizos and mulattoes. The capital, Santo Domingo, has a population of about 20,000. Spanish is the official language and the Roman Catholic the state religion. In 1900 there were some 300 primary schools with an attendance of about 10,000. There are also secondary, normal, and technical schools, and a professional school of collegiate grade.

Government.—The legislative power is vested in a national Congress of 24 deputies chosen by popular vote for a period of two years. The chief executive is a president, elected by an electoral college for a term of four years. The administration embraces the departments of interior and police; finance and commerce; justice and public instruction; war and navy; public works and foreign affairs. The country is divided into six provinces and six maritime districts, each under a governor appointed by the president. The communes enjoy a large measure of self-government. Justice is administered by a supreme court of justice and eleven territorial tribunals of first instance, besides local magistrates in every commune. The revenue is derived mainly from customs. In 1901-02 the public receipts and expenditures balanced at 1,238,440 dollars in gold, the United States dollar being the unit of value. The public debt in the middle of 1901 amounted to about \$20,950,000 in foreign obligations, and \$2,845,550 in gold and \$10,226,629 in silver, within the country. The military strength of the republic comprises a small standing army, occupying the principal towns, and a national militia. The navy consists of two gunboats, one of 888 and one of 350 tons.

Production, Commerce, etc.—The principal products are sugar, tobacco, cacao, coffee, logwood, mahogany, and fruits. In 1900 the production of sugar amounted to 75,403,000 pounds. The principal articles of export are: sugar, cacao, coffee, mahogany, and logwood. Minor items are hides, wax, divi-divi, and rum. The imports consist of cotton goods, hardware, and provisions. In 1901-02 the imports were valued at \$2,986,921 in gold, and the exports at \$5,224,043. In 1899 the number of vessels entering the ports of the republic was 544; and the clearances were 380. The principal port is Puerto Plata. There are about 116 miles of railway and 430 miles of telegraph.

Early in 1902 signs of dissatisfaction were apparent with the president, Isidro Jimenez, who had assumed office in October, 1899, after the overthrow and assassination of President Heuraux. The opposition was led by the vice-president, Horacio Vasquez, and assumed the form of armed rebellion in April. The revolutionists gained possession of the town of Santo Domingo on May 2, 1902, and President Jimenez was compelled to seek refuge in the French consulate. He resigned the presidency and sailed for New York, where he declared his defeat a victory for despotism. The national Congress was dissolved and a provisional government was instituted with Horacio Vasquez as president.

SARAWAK, a British protectorate in Borneo (*q.v.*).

SAUNDERS, FREDERICK, a former librarian of the Astor Library, New York City, died December 12, 1902, in Brooklyn, N. Y. He was born August 14, 1807, in London, England, and came to the United States in 1837. Having established a branch of his father's London publishing house, he endeavored unsuccessfully to

secure the passage of an international copyright law in Congress. Afterwards he became city editor of the *New York Evening Post*. Appointed assistant-librarian of the Astor Library in 1859, he became librarian in 1876, and discharged the duties of that office for twenty years. He was the author of *Salad for the Solitary* and the *Social, Pastime Papers, Evenings with the Sacred Poets, New York in a Nut Shell, Story of Some Famous Books, Stray Leaves of Literature, Memoir of the Great Metropolis, Character Studies, Story of the Discovery of the New World by Columbus*.

SAVINGS BANKS. The following table, prepared by the comptroller of the currency, compares statistics for savings banks for the fiscal years 1901 and 1902:

STATES, ETC.	1900-1901			1901-1902		
	Number of Depositors	Amount of Deposits.	Average to Each Depositor.	Number of Depositors.	Amount of Deposits.	Average to Each Depositor.

SAXE-WEIMAR, Prince of, WILLIAM AUGUSTUS EDWARD. See EDWARD, WILLIAM AUGUSTUS, Prince of Saxe-Weimar.

SCENIC AND HISTORIC PRESERVATION SOCIETY, AMERICAN, incorporated by the New York State legislature in 1895, has for its objects the protection of the beauties of natural landscape from disfigurement, the preservation of geological formations, the saving from obliteration of names, places and objects identified with local, State and national history, the erection of historical memorials, etc. The society is empowered to receive by purchase, gift, or otherwise, real or personal property necessary for its purposes, and is required to make an annual report to the State legislature. It has three classes of members, annual, life, and a class designated as patrons. At the instance of the society the State of New York purchased in 1897 a tract of thirty-three acres, which included the historic battlefield of Stony Point, the scene of "Mad Anthony" Wayne's celebrated Revolutionary victory. It was placed in charge of the society and was publicly dedicated as a State reservation on July 16, 1902, the 123d anniversary of the battle. The society has also influenced the creation of another State reservation by the purchase of about thirty-five acres at the head of Lake George, made famous by events during the French-Indian and Revolutionary wars. The society was represented on the Interstate Palisades Commission, now engaged in the prevention of further disfigurement of scenery along the Hudson River and is credited with having influenced the donation of the Fort Washington monument to the public by Mr. James Gordon Bennett, November, 1901. Recently the society has turned its attention to the preservation of Fraunce's Tavern (the scene of Washington's farewell to his army), the Alexander Hamilton Grange, and Poe's cottage, in New York City, and the Philipse Manor Hall, in Yonkers. President, Hon. Andrew H. Green; secretary, Edward Hagaman Hall, Tribune Building, New York City.

SCHENCK, LEOPOLD, a German physician, for many years director of the Embryological Institute in Vienna, died in Schwanberg, Styria, August 18, 1902. His theories for predetermining sex brought him into great prominence in 1898 upon the publication of his book, *Einfluss auf das Geschlechts verhältnis*, translated as *The Determination of Sex*. The theory was made the subject of considerable professional controversy in medical periodicals. Starting with the premise that ordinarily the blood of the female has fewer red corpuscles than the blood of the male, Dr. Schenck argued that as nutrition determines the condition of the blood, a prescribed diet affecting the mother's blood would determine the sex of the offspring. Many royal personages were placed under his care and his treatment was sometimes successful; but scientific interest in the discovery gradually subsided.

SCHOOLS. Statistics of the State school systems for the year 1900-01 are given on the following page. These figures include the number of secondary schools and enrolment therein and the total expenditure for schools. For other information concerning common schools, see EDUCATION IN THE UNITED STATES; see, also, NORMAL SCHOOLS, PROFESSIONAL SCHOOLS, and UNIVERSITIES AND COLLEGES.

SCIENCES, NATIONAL ACADEMY OF, incorporated by act of Congress, May 3, 1863, has for its object the examination and investigation of any subject of science or art and reporting on the same at the call of the United States government, the actual expense of such examination and report to be paid out of appropriation made for that purpose. The Academy cannot receive compensation under any circumstances from the government for its services. Meetings are held at such places in the United States as may be specially designated when reports of the work of the year are made, the annual meeting being held in Washington, on the third Tuesday in April. The Academy is composed of members, honorary members, and foreign associates. Citizenship is a prerequisite of membership, while the foreign

associates are limited to fifty. The Academy has a membership of ninety at the present time, and there are twenty-six foreign associates. The officers are elected for six years. Those now in office and the dates of their expiration are as follows: President, Prof. Alexander Agassiz, Cambridge, Mass. (1907); vice-president, Asaph Hall, Norfolk, Conn. (1903); foreign secretary, Ira Remsen, Baltimore, Md. (1907); home secretary, Arnold Hague, Washington, D. C. (1907); treasurer, Charles D. Walcot, Washington, D. C. (1904).

SCOTLAND. See GREAT BRITAIN.

SCOTLAND, CHURCH OF. The Established Church of Scotland is the State church, the crown being represented by a lord high commissioner, who is annually appointed, but maintains a Presbyterian polity. It is governed by a general assembly, which meets every year in Edinburgh. There are 16 synods and 84 presbyteries, having 1809 churches, 1674 ministers, and 668,335 communicants. The Church of Scotland supports active missionary work in India and Africa, and maintains in the foreign field 130 missionaries. Its income aggregates considerably more than \$2,300,000.

SCOTLAND, UNITED FREE CHURCH OF, organized in 1900 by the union of the Free Church of Scotland and the United Presbyterian Church, is similar in doctrine and government to the Established Church, but is entirely separate from the State. It has 11 synods and 64 presbyteries, 1702 churches, 1934 ministers, and 534,831 members. The total income exceeds \$5,000,000. A significant action of the general assembly in 1902 was its refusal to condemn a work of higher criticism, thus indicating the liberal attitude of the church, which has been ever noted for its conservatism. When the union of the two churches was consummated in 1900, there was a dissentient minority in the *Free Church of Scotland*, which brought action against the United Church to recover the property and funds of the Free Church. Having lost the original suit, they appealed to a higher court which confirmed the first decision; an appeal from this latter judgment has been carried to the House of Lords. The number of anti-unionists, who claim 26 ministers and 93 congregations, is said to be between 50,000 and 80,000.

SCOTT, Sir FRANCIS CUNNINGHAM, commander of the British Ashanti expedition of 1895-96, died June 26, 1902, in London. He was born in India in 1834, and obtained a commission in the Forty-second Highlanders in 1852. He saw service in the Crimean War and the Indian Mutiny, being present at Alma, Balaklava, and Sebastopol, and in the relief of Lucknow. In the Ashanti war of 1874 he was brevetted lieutenant-colonel and created C.B. Subsequently he served in the Body Guard, in which he commanded a battalion of the Middlesex regiment from 1885 to 1888. Appointed inspector-general of the Gold Coast Constabulary in 1891, he led an expedition against the Jebus the following year, and took their capital after three days' consecutive fighting. He commanded a similar expedition against the Attabubus, and the important Ashanti expedition in which he captured the court at Kumassi. He was appointed commander of the local forces in Trinidad in 1898. The decorations of K.C.M.G. and K.C.B. were conferred upon him, respectively, in 1892 and in 1896.

SCUDDER, HORACE ELISHA, an American editor and author, died January 11, 1902. He was born at Boston, Mass., October 16, 1838; graduated at Williams College in 1858, and, having taught for three years in New York, became a reader for Hurd and Houghton (later Houghton, Mifflin and Company), and from 1867 to 1870 was editor of their *Riverside Magazine for Young People*. In 1890-98 he was editor of the *Atlantic Monthly*, and subsequently literary adviser to Houghton, Mifflin and Company. He was known as a scrupulous editor—as, for example, in the *American Commonwealths* series—and a thoughtful biographer and essayist. Among his publications are: *Stories from My Attic* (1869), a *Life of Noah Webster* (1882), a *History of the United States* (1884), *Men and Letters* (1888), and the authoritative biography of *James Russell Lowell* (1901).

SCULPTURE. The most important undertaking before American sculptors during the year 1902 was the preparation for the decoration of the buildings and grounds of the Louisiana Purchase Exposition at St. Louis. In July, 1901, the direction of this work was placed in the hands of Mr. F. Wellington Ruckstuhl, the sculptor, who formed an interesting scheme according to which work proceeded until December 31, 1902, when, largely for personal reasons, Mr. Ruckstuhl resigned his position and was succeeded by Mr. Karl Bitter.

There have been appropriated \$400,000 for carrying out an elaborate plan of sculptural adornments, in which the chief interest centres in the cascades on the hill leading up to the Art Building. In the competition for the monument to General Grant in Washington, the award of the jury was to Mr. Shrady, a comparatively unknown sculptor; the second place being given to Mr. Niehaus. Several matters

relating to the location of sculpture came before the Art Commission of the City of New York, the most important being the equestrian statue of General Sherman by Mr. St. Gaudens, which was assigned to the Circle at Fifty-ninth Street and Fifth Avenue, and the Maine Monument, which was assigned to Longacre Square. In December, 1902, an interesting exhibition of the National Sculpture Society, in conjunction with the Florists' Club, was held in Madison Square Garden, New York City. The large contract for the sculptural decoration of the State House, at Harrisburg, Pa., was awarded to Mr. Barnard. Work on the pediment sculptures of the New York Stock Exchange by Mr. Ward and Mr. Bartlett is far advanced. Mr. Rupert Schmid, of San Francisco, has completed a frieze of great size and some importance for the Memorial Arch of Leland Stanford, Jr., University.

English sculptors are busy with numerous monuments to Queen Victoria, which are to be erected in various parts of the empire. The exhibition of sculpture at the Royal Academy was small but interesting, the most important work being a colossal equestrian statue of the Black Prince by Mr. Brock. Mr. Brock also exhibited a bronze statue of a Royal Scots fusilier, a memorial of the African war, and a marble statue of Gladstone for Westminster Abbey. Other works were "The Crown of Love" and "The Springtime of Life," by Mr. Colton, and several busts by the late Mr. Onslow Ford.

In France the immense exhibition of sculpture at the Salon was more dignified and less sensational than usual. Notable works were the polychromatic statue of "La Pensée," by M. Puech; a statue of a dancer by Gérôme, also slightly colored; the monument to the painter Louis François, by Peynot (sculptor) and Godefroy (architect), and portions of the monument to Gounod by Mercié. The monument to Victor Hugo by Barrias has been located near the house which the poet formerly occupied in Paris. There was an exhibition of works of the late M. Falguière at the Ecole des Beaux Arts in February, 1902. His atelier, with its contents, has been left to the public as the Musée Falguière. The widow of the great sculptor Carpeaux has presented to the city of Paris a series of important studies left in his atelier. The sculptor Jules Dalou (q.v.) died in April, 1902. M. Guillaume, the sculptor, has been a third time elected director of the French Academy in Rome. He has held that office eighteen years. The Musée des Arts Décoratifs of the Union Centrale des Beaux Arts was installed in the Pavillon de Marsan of the Tuileries, June 4, 1902. The first grand prix de Rome in sculpture was awarded to M. Terroir, a pupil of Cavellier and Barrias; the first-second to M. Brasseur, a pupil of Barrias; the second grand prix to M. Descatoire, a pupil of Labrousse and Thomas.

In Germany an important occurrence is the completion of the Pergamon room in the Berlin Museum, in which the splendid fragments discovered by the Germans on that site since 1886 have been placed as nearly as possible in their original position. Max Klinger, one of the most powerful and imaginative of the school of German painters who follow Boecklin, has produced lately many interesting works in sculpture, the most extraordinary being a partially nude statue of Beethoven, which was finished in March and afterwards sent to the exhibition of the Secession in Vienna. A monument to Von Moltke is in preparation, to be placed opposite the Bismarck monument in the Königsplatz in Berlin. "L'art nouveau" is making great strides in Germany and Austria. All the exhibitions show interesting small bronzes in the unconventional manner that goes by that name.

"L'art nouveau" reached its climax in the exposition inaugurated at Turin on May 10, 1902. The jury accepted nothing which showed any definite affiliation with the conventional styles. The most important work of sculpture at this exhibition was the equestrian statue of Amadeo of Savoy, the main interest of which rests in the splendid groups of cavalry about its base. There were many interesting statues on the central building. The vast monument to Victor Emmanuel in Rome, which was begun over twenty years ago, is making great progress and will be finished in seven years.

SEDDON, RICHARD JOHN, premier of the British colony of New Zealand since 1893, took part in the conference of colonial premiers at London in the summer of 1902. He was born at Eccleston, Lancashire, England, in 1845; was educated at Eccleston Hill School, and in 1863 went to Australia, settling at first in Melbourne, where he obtained employment in the profession for which he had been trained—that of a mechanical engineer. After a short time he removed to New Zealand, with the history and development of which colony he has since been prominently connected. His political career in New Zealand began in 1879 with his election to the colonial house of representatives, of which body he has remained a member. He was one of the earliest and strongest advocates of the extension of the scope of the state's activities, and the ownership of public utilities. From 1891 to 1893 he held the portfolios of minister of mines, minister of public works, and minister of defense. In 1893 he became premier, and while still retaining for three years longer the portfolios of public works and defense, he undertook also the offices of colonial

treasurer, postmaster-general, minister of labor and minister of native affairs. After 1896 he continued to hold the premiership and the four latter offices. He has thus familiarized himself with almost all departments of the colonial government, and it is probably due to this accurate knowledge of their relation to the economic and industrial life of the islands that he was able to undertake the reformation and extension of the colony's governmental activities which have made New Zealand more advanced in its adoption of the principles of state socialism than any other community in the world.

SELENKA, EMIL, a German zoologist, died in January, 1902. He was born February 27, 1842, in Brunswick, Germany, and after study at Göttingen was, in 1868, made professor of zoology and comparative anatomy in Leyden. In 1874 he was called to the same post at Erlangen, and in 1896 he became an honorary professor at Munich. His chief interest and scientific accomplishment was in the study of echinodermata and vertebrate animals. His various writings include: *Zoologische Studien* (1878-81), *Studien über Entwicklungsgeschichte der Tiere* (1883-92), *Ein Streifzug durch Indien* (1890), *Sonnige Welten* (with his wife, 1896).

SELFRIDGE, THOMAS OLIVER, rear-admiral U. S. N., who was the senior officer on the retired list, died October 15, 1902, at Waverly, Mass. He was born April 24, 1804, in Boston; entered the navy in 1818, was a midshipman on the old *Constitution*, and became lieutenant in 1827. In 1844 he was commissioned commander and was soon afterwards assigned to the flagship of the East Indian squadron. In the Mexican War he took part in the capture of Matanzas and Guaymas, and received a wound in the latter engagement which incapacitated him for sea duty during the Civil War. In 1855 he was commissioned captain, and later took command of the navy yard at Boston. In 1861 he joined the Gulf squadron, but was soon obliged to give up sea duty again on account of his wound, and was put in command of the navy yard at Mare Island, Cal. In 1862 he was commissioned commodore and in 1866, after forty-eight years of service, was retired. He served later as commandant of the Philadelphia navy yard and as president of the examining board. He was probably the oldest rear-admiral in any navy of the world. His son, T. O. Selfridge, who survives him, was retired with the rank of rear-admiral in 1898.

SELWIN-IBBETSON, Sir HENRY JOHN, first Baron Rookwood, died in London, January 16, 1902. He was born in London, September 26, 1826, and graduated at St. Johns College, Cambridge, in 1849. He unsuccessfully contested Ipswich in 1851 and 1859, entered Parliament for South Essex in 1865 as a Conservative, and represented West Essex from 1868 to 1892. He was under secretary of state for the home department from 1874 to 1878, financial secretary to the treasury from 1878 to 1880, and from 1885 to 1892 was second church estate commissioner. While in Parliament he was instrumental in securing the opening of Epping Forest, and in introducing the block system on English railroads. He was raised to the peerage in 1892 and took the title of Baron Rookwood.

SENEGAL, a French colony of West Africa, occupying the coast region between the Sahara and the River Gambia. Including the Senegambian hinterland, which extends inland for about 900 miles, it has an area of about 200,000 square miles, and a population of over 3,200,000. Senegal proper has an area of 80,000 square miles and a population of 1,180,000. By the reorganization of French West Africa (*q.v.*) Senegal itself is a part of that colony, under the supreme administrative control of its governor-general, who is represented by a lieutenant-governor for Senegal, residing at St. Louis, which has 22,000 inhabitants. The colony is represented in the French parliament by one deputy. There is an independent budget for Senegal proper, but the hinterland, under the new arrangement, is administered jointly with the other West African colonies, which contribute to its budget. A military force of 2600, of whom 1180 are native troops, is maintained. The local budget for 1901 balanced at 4,644,730 francs. The imports in 1901 were valued at 64,074,000 francs, and the exports at 38,205 francs. Maize, millet, and rice are cultivated; other products include earth nuts (140,000 tons in 1900), gums, castor-beans, cocoanuts, rubber, and kola. Gold, silver, and copper are mined. Native industries comprise weaving, pottery, and brick-making. There were 520 miles of railway open in 1900 and the line is being rapidly built into the interior.

SERUM THERAPY. Activity in this branch of therapeutics was notable during 1902, and the amount of investigation was enormous. Many new serums have been prepared, but thus far none has duplicated the success of diphtheria antitoxin. Failures have been numerous and successes few and unsatisfactory, but enough has been learned to promote a revolution in the methods of treating diseases in the future. The best results have been obtained in prophylactic vaccination with anti-plague serum. Dr. Pinto, of Rio de Janeiro, states that during the recent widespread epidemic of plague at Campos, 1803, exposed persons were inoculated; out of these only one contracted the disease. In another district one individual who refused to be inocu-

lated was the only person to acquire plague. However, it is possible that better results were obtained because the disease is of a mild character in Brazil. In India, Haffkine's prophylactic serum has again been found of service in preventing outbreaks of plague. In persons who have acquired the disease the serum treatment has not been so brilliant. In Bombay, of cases treated with Lustig's serum, from 67 per cent. to 77 per cent. died. Of cases not treated with serum, from 61 per cent. to 98 per cent. died. The lower averages are for non-septicæmic cases, and the higher for those received at hospitals in a state of septicæmia.

SERVIA, formerly an autonomous Turkish dependency, but since the Treaty of Berlin (1878) an independent constitutional monarchy, lies in the Balkan peninsula, south of Hungary, between Bosnia and Bulgaria. The capital is Belgrade, with 69,990 inhabitants. The area of the country is 19,050 square miles and the population in 1901 was 2,535,915. Four-fifths of the inhabitants are Servians, and most of the remainder Roumanians or Gypsies. The state church is the Orthodox Greek, of which most of the inhabitants are adherents. Primary education is nominally compulsory and partly free, but 80 per cent. of the people are illiterate.

Government and Finance.—A new constitution was granted by King Alexander in 1901, entailing the succession upon his direct descendants of either sex. The executive power is vested in a king assisted by a cabinet of eight responsible heads of departments. The legislative authority is vested jointly in the king, a senate, and the national assembly (Skupshtina). The senate is partly appointed by the king and partly elected. The Skupshtina is composed of 130 delegates elected by the people on a limited suffrage. The ruling sovereign, Alexander I., became king in 1893. Military service is compulsory for all males over twenty-one years of age. Service comprises two years in the active army, eight years in the reserve, and thereafter enrollment in the militia for twenty years. The active army numbered in 1902 22,448 officers and men, the mobilized regulars and reserves numbered 160,751, and the war effective 353,122 men. There is no navy. The standard of value is the dinar, worth one franc, or 19.3 cents. Revenue is derived from customs, excise, direct taxes, and monopolies. The budget for 1902 showed receipts of 70,565,981 dinars and expenditures of 72,983,135 dinars. The public debt on January 1, 1902, was 418,685,093 dinars. The National Bank of Servia, with a nominal capital of 20,000,000 dinars, has a monopoly of the note issue, which, in 1901, was 35,900,000 dinars, secured by a gold and silver reserve of 44 per cent. of that amount.

Industries, Commerce, etc.—Servia is an agricultural country, the cultivation being largely in the hands of peasant proprietors with small holdings. Maize, wheat, oats, and barley are the principal cereal crops. Plums are one of the chief products, the yield in 1897 being 14,046,497 quintals, and amounting annually to more than 10 per cent. of the total value of exports. The drying and canning of fruits is one of the most important industries, while flour-milling, carpet and rug-weaving, and tanning, are important. The imports in 1901 were valued at 43,835,000 dinars, and the exports at 65,685,000 dinars. Sixty per cent. of the trade is with Austria-Hungary and Germany. There were 354 miles of railway in operation in 1902 and several extensions under construction.

HISTORY.

Ministerial Troubles.—On March 20, 1902, as a result of an adverse vote in the Skupshtina, Premier Vuitch, the head of the Radical cabinet that came into power in 1901, handed in his resignation. The assembly had no intention, however, of causing a change in ministry, and the next morning reconsidered its action and passed a vote of confidence, upon which Premier Vuitch withdrew his resignation. But the situation was unsatisfactory until May 18, when M. Vuitch again resigned, and the king gave the task of reconstituting the ministry to M. Pasitch, also a Radical. M. Pasitch failed, and the king, loath to turn to the Liberals, recalled M. Vuitch, who reconstructed his cabinet, by introducing four new ministers. The cabinet as then constituted comprised 4 Radicals, 3 Progressists, and 1 independent. This cabinet remained in power until October, when an affair interesting from an international point of view led to M. Vuitch's resignation for a third time. Since Alexander and his government have broken with the Austro-German alliance of the late king Milan and have sought a *rapprochement* with Russia, they have considered as a necessary consummation of that policy a meeting between the king and czar. M. Vuitch, as premier, had made this a prominent point in his programme. In October, 1902, after several postponements, the meeting seemed likely to take place, when it was announced that a new obstacle had arisen in the illness of the czarina, which would make it impossible for her to receive the royal Servian visitors. At least, "illness" was the official explanation given at St. Petersburg. In Servia, however, it was believed that the real truth of the matter was that Austro-German influences had apprised the czarina of the scandalous stories connected with Queen Draga before and after her marriage, and that therein lay the

real reason. In order therefore to give the king a free hand, M. Vuitch resigned. For some days it seemed possible that there would be a complete revolution in Servian policy, both foreign and domestic, and that the king, piqued by Russia's snub, would adopt the Austrophil policy of his father, with a probable reactionary policy in domestic affairs. This belief proved without foundation, however, for the king intrusted the formation of a new cabinet to M. Velimirovitch, who chose its members from the Radicals and Progressists, like the Vuitch cabinet, with no anti-Russian representative. Nevertheless the pride of both king and nation had been wounded, and when, after a short and uneventful existence, the Velimirovitch cabinet gave place on November 18 to a ministry chosen by General Markovitch, and containing, besides himself, two military men, it was said that the king had come to a realization that his pro-Russian policy was a mistake, and that he intended to establish a strong military régime. At the end of the year the journey to St. Petersburg seemed just as far off as ever, but cordial relations between Russia and Servia had been, in a manner, restored by a visit of Count Lamsdorff to Belgrade late in December.

SEWAGE PURIFICATION. No leading American city completed sewage purification works during 1902, but a number of works were constructed by small cities and towns, and perhaps even more by public institutions. The installation of chemical precipitation works for the treatment of sewage has practically stopped in both America and Great Britain, and instead septic tanks are being built. Likewise sewage irrigation abroad and intermittent filtration of sewage in the United States and Canada are being superseded by the use of bacterial filters, although in America the old filter beds are rarely being abandoned or altered for the new and more rapid bacterial filters. At Manchester, England, after a careful investigation by expert engineers, chemists and bacteriologists, work has been started on changing old chemical precipitation tanks to septic tanks, and on the construction of bacterial contact beds. From a paper by Mr. J. P. Wilkinson, read before the Sanitary Institute of Great Britain, in 1902, it appears that the new Manchester works are designed to treat a maximum daily flow of house sewage and storm water amounting to about 150,000,000 U. S. gallons a day, of which half will pass from the tanks through the double contact beds, and the excess will be sent to storm water filter beds. In addition to the contact beds, land for irrigation has been acquired or arranged for, to meet the requirements of the British local government board. With this area in use the sewage will be subjected to septic or anaerobic bacterial action in the tanks, aerobic bacterial action in first and second contact beds, and then have a final treatment on a sewage farm. The total cost of the new works, and accessories, is estimated at about \$2,500,000.

The sewage of western London is gathered in intercepting sewers and carried down on either side of the River Thames to two large chemical precipitation plants, at Barking and Crossness, respectively. The effluent from these works is discharged into the Thames without further treatment, but it has been recognized for some years that the practice would not much longer be permissible. Accordingly, the London county council has, for several years past, been experimenting with bacterial purification. The magnitude of the London problem may be partly appreciated from the fact that for the year 1901-02 the sewage and main drainage from an area of 141 square miles, with a total population of 5,137,000, was treated at the precipitation works; and that the average daily quantity so treated was about 282,000,000 U. S. gallons, or over 100,000,000,000 gallons for the whole year. The sludge from the precipitation tanks was sent out to sea in barges, and dumped, amounting to 2,479,000 gross tons for the year. The net expenditure for the year's maintenance was over \$1,000,000. In April, 1902, Prof. Frank Clowes, chemist to the London county council, presented the fourth (and for the present the final) report on the "Bacterial Treatment of Crude Sewage," in experimental settling tanks and coke bacterial filter beds at Barking and Crossness. The conclusions reached after several years of analytic and other studies of the crude and the treated sewage were that by combining settling, or septic, tanks with coke bacteria beds the use of chemicals could be stopped and an effluent could be produced that would not give rise to offensive putrefaction, even at summer heats, if discharged into the Thames. On the strength of these conclusions the report states that "it would appear desirable, therefore, without delay, to commence the treatment of the London sewage by the above bacterial method." The necessary changes and additions would be made by degrees. Up to the close of the year no definite measures toward carrying out these recommendations appear to have been adopted.

In Massachusetts, the State board of health is continuing its experimental studies of sewage purification, begun at Lawrence in 1887, and is publishing its results from year to year in its annual reports. Detailed studies of the septic tank are being made at Worcester, Mass., by Prof. Leonard Kennicutt and Mr. Harrison P. Eddy. Some of the earlier results, combined with a review of other investigations of the septic

task, were given in the third report of the Connecticut sewerage commission, published in 1902 (R. A. Cairns, secretary, Waterbury, Conn.).

The number of sewage purification works in the United States, as reported for places of 3000 population and upwards early in 1902, was 95. Of these plants, 24 employed intermittent filtration alone, and three others combined that process with broad irrigation or sedimentation, making 27 in all; 21 employed broad irrigation, alone, or some modification of it; there were seven independent septic-tank works, and 15 others combined with some form of filtration, making a total of 22; chemical precipitation, by itself, claimed seven, and in various combinations, three plants, making 10 in all. The remaining 15 of the 95 plants were of a miscellaneous or indeterminate character. For a descriptive list of these works, see *The Municipal Year Book* (New York, 1902).

SEWERAGE. The introduction of sewers for the removal of household wastes lags far behind the provision of public water supplies. As a partial illustration of this may be cited the fact that in places of 3000 population and upwards by the national census of 1900, 1475 had public water supplies in 1902, and only 1096 had sanitary sewerage systems. Among the larger places without sanitary sewers were the following, in order of their population: Baltimore, Md., 508,957; New Orleans, La., 287,104; Allentown, Pa., 35,416; Gloucester, Mass., 26,121; Warwick, R. I. (a "town" of more or less scattered population), 21,316; Columbia, S. C., 21,108; Shenandoah, Pa., 20,321. Bids for a sewerage system at Baltimore were invited in 1902, and the construction of a system at Columbia was also started during the year. Baltimore has some large sewers for removing surface water, and has had sanitary sewers under active consideration for several years past. A new commission was created in 1902 to devise a plan for stopping the pollution of that portion of the Passaic River beginning at Paterson and extending to Newark Bay. A great nuisance has existed there for a number of years past, and several commissions have reported on its abatement. The new commission was to report to the State legislature of 1903, and there was reason to suppose that its report, like those resulting from the last investigation, would favor an immense trunk sewer down the lower Passaic Valley, across Newark Bay, and out into deep water near Robin's Reef, New York harbor. Such a plan involves a low-lift pumping station on the Newark Meadows.

SEYCHELLES, a group of islands in the Indian Ocean, 1000 miles north of Mauritius, of which they were formerly an administrative division, constitute a British crown colony. The 74 named islands in the group have a total area of 148 square miles and a population (1900) of 20,275. The seat of government is at Victoria, on the island of Mahé. The executive authority is vested in an administrator, or governor, assisted by executive and legislative councils. The revenue in 1901 was Rs. 486,323 and the expenditure Rs. 401,821. (The rupee is worth 32.4 cents.) The imports in 1901 were valued at Rs. 1,149,646 and the exports at Rs. 1,417,515, of which amount the value of vanilla constituted Rs. 1,108,792. In addition to vanilla the exports included cocoanuts, coconut oil, tortoise shell, and guano.

SHAKERS, the Millennial Church, or United Society of Believers, constitute the oldest existing communistic society in the United States, their first community in this country, having been organized in 1787 at New Lebanon, N. Y. There are 15 settlements—2 each in Maine, New Hampshire, New York, Ohio and Kentucky, 3 in Massachusetts, and in Connecticut and Florida 1 each—comprising some 30 families with about 1200-1300 members. The settlements are termed societies, whether composed of one family or of a group, most of the societies having two families, some as many as four, and others, but a single family. Church edifices are owned by 13 societies, and there are ten or eleven common schools. The property in possession of the Shaker communities is valued at more than one million dollars. In each family there is a "lot" of elders, when full, comprising two persons of each sex, and in addition to the elders, there are five sets of ministry, of similar composition, only two ministerial orders, however, being full. The office of the ministry corresponds to that of bishops in other churches, they having charge over the elders, the heads of families. The number of ministers among the Shakers is between 50 and 60. The greatest strength of the society is in the State of New York, where 8 families exist under the control of the central ministry.

SHEPHERD, ALEXANDER R., second territorial governor of the District of Columbia, died September 12, 1902, at Batopilas, Mexico. He was born January 31, 1835, in Washington, D. C. At the opening of the Civil War he served in the national guard, and in 1861 became active as an organizer of the "unconditional party," which carried Washington, and he was elected president of the council. Being overwhelmingly defeated for alderman in 1863, he abandoned politics for the time, but in 1870 he was one of the leaders of the successful reform movement, which won at the polls. He advocated the creation of the territorial government

which went into effect in 1871, was appointed by President Grant chairman of the board of public works, and planned for Washington a vast scheme of improvements that he attempted to carry out when appointed governor in 1873. Before the year was out and the form of government changed, he had spent \$40,000,000 of the public funds and left as a legacy a debt of \$27,000,000 more. The execration heaped upon him at the time subsequently transformed itself to praise for his having made Washington a beautiful city. He returned to business, failed for over a million dollars, and then took up silver mining in Mexico, where he gained and lavished money on a princely scale.

SHIPBUILDING. The year 1902 was in the main one of great activity for shipbuilders, and most of the great plants were busily engaged. The tonnage constructed, as will be seen from the accompanying tables, though not equaling that of 1901, was unusually large, and extremely favorable conditions were reported in American yards, where the shipbuilding industry is slowly but steadily developing:

WORLD'S SHIPBUILDING FOR 1902 AND 1901.

The six largest merchant vessels launched during 1902 were the following:

VESSEL.	B. T. Tons.	Builders of Vessel.
Cedric.....	20,984	Harland & Wolff, Belfast.
Kaiser Wilhelm II.....	20,100	Vulcan Co., Stettin.
Arabic.....	15,865	Harland & Wolff, Belfast.
Ionic.....	12,232	Harland & Wolff, Belfast.
Corinthia.....	12,231	Harland & Wolff, Belfast.
Mayflower.....	11,959	Hawthorn, Leslie & Co., Hebburn.

Harland & Wolff again have the honor of constructing the largest number of great vessels, and their aggregate production for the year 1902 amounted to 79,497 tons. This is the largest amount turned out by any single yard, but considering the production by firms, the American Shipbuilding Company, with its seven yards, would lead, as the following figures of the production of the six leading shipbuilding firms of the world indicate: The American Company (seven yards), 132,197 tons; Harland & Wolff, Belfast, 79,497; Workman, Clark & Co., Belfast, 75,932; C. S. Swan & Hunter, Newcastle-on-Tyne, 58,322; Russell & Co., Port Glasgow, 55,585; Armstrong, Whitworth & Co., Newcastle-on-Tyne, 52,039.

Total	1,580	483,489	1,491	468,831

Number and tonnage of vessels built in the United States during the calendar year 1902, as compiled by the commissioner of navigation:

	WOOD.				STEEL.				TOTAL.	
	Sail.		Steam.		Sail.		Steam.		No.	Gross.
	No.	Gross.	No.	Gross.	No.	Gross.	No.	Gross.		
Atlantic and Gulf....	514	56,340	271	16,382	9	13,345	62	128,571	856	214,538
Porto Rico.....	9	137							9	137
Pacific.....	60	27,078	98	10,384			3	10,970	161	48,432
Hawaii.....	2	15	2	20					4	35
Great Lakes.....	11	2,909	49	3,054			44	152,267	104	158,230
Western rivers.....	1	11	120	5,039			7	2,905	128	7,955
Total.....	597	86,390	540	34,879	9	13,345	116	294,713	1,262	429,327

Examining these figures in comparison with those for 1901, it will be found that there was a considerable increase in tonnage, but a decrease in the number of vessels, the additions for 1902 amounting to 1262, with an aggregate gross tonnage of 429,327 tons against 1322, with an aggregate gross tonnage of 376,129 in 1901. This implies of course that the vessels constructed were of greater average size. The failure of passage of the Ship Subsidy bill may act as a damper on further shipbuilding, but the United States navy has a programme of construction which will demand the attention of a number of builders. See NAVIES.

SHIPPING MERGER. During 1902 was consummated the consolidation of five great English and American trans-Atlantic steamship lines and the pooling of the two great German lines with the new company. The final arrangements were completed October 1, though the agreements with the English companies had been signed in February, and with the German companies in May and June. The new corporation was incorporated under the laws of New Jersey under the name of the International Mercantile Marine Company. The officers are: President, Clement A. Griscorn; vice-president, Right Hon. W. J. Pirrie; directors, C. A. Griscorn, P. A. B. Widener, B. N. Baker, John I. Waterbury, George W. Perkins, E. J. Berwind, James H. Hyde, Charles Steele, Right Hon. W. J. Pirrie, J. Bruce Ismay, Sir Clinton E. Dawkins, Henry Wilding, Charles F. Torrey; executive and finance committee, C. A. Griscorn, P. A. B. Widener, George W. Perkins, Edward J. Berwind, Charles Steele; British committee, Sir Clinton E. Dawkins, chairman, Right Hon. W. J. Pirrie, J. Bruce Ismay, Henry Wilding, Charles F. Torrey.

The following was announced to be the initial distribution of preferred and common stock and of the cash received from the sale of bonds:

	Cash.	Bonds.	Stock, Preferred.	Stock, Common.	Total.
J. P. Morgan & Co. syndicate.....		\$50,000,000	\$2,500,000	\$25,000,000	\$27,500,000
International and Atlantic Transport.....	\$15,844,000		18,314,000	9,157,000	43,315,000
Leland Line.....	11,736,000				11,736,000
Working capital.....			736,000	5,643,000	7,429,000
Balance.....	22,420,000		38,400,000	19,200,000	80,020,000
Total.....	\$50,000,000	\$50,000,000	\$60,000,000	\$60,000,000	\$170,000,000

The preferred stock bears a 6 per cent. cumulative preferential dividend. The common stock is limited to 10 per cent. dividends as long as any gold debentures remain outstanding. The whole of the share capital is held in the names of five voting trustees, J. P. Morgan, Right Hon. W. J. Pirrie, J. Bruce Ismay, P. A. B. Widener, and Charles Steele. The only limitation put upon the voting trustees is that they are not to authorize or consent to any increase of capital of the company or any of its property except with the consent of the registered holders of two-

thirds of the preferred shares. The properties of the White Star and Dominion lines were purchased outright by the corporation, but it was deemed advisable to have them held in an English company, not only to enable the collection of British subsidies but to allay the popular excitement in England with regard to the transfer of British vessels to foreign ownership. An agreement was accordingly entered into with the British government, whereby it was agreed that the British companies should remain British. Accordingly the International Navigation Company (Limited) of Liverpool was formed for the purpose of holding the shares purchased of these companies. This soothed the excited feelings of Englishmen, and at the same time enabled the combine to collect mail subsidy and admiralty subventions upon the fast White Star liners.

An agreement with the shipbuilding firm of Harland and Wolff, of Belfast, Ireland, provided that all construction and heavy repairing necessary to be done in British yards should be given to that company. The builders on their part agreed to give first place to the work of the combine. "Nothing herein contained, however, shall prevent the purchasers from placing orders for new steamers, or heavy repairs, or alterations, reboiling, or re-engining at shipyards in the United States." The cost of the work to the combine is to be determined by the cost of materials, wages, direct expenses, and a due proportion of fixed expenses and establishment charges, as shown by the books of the builders. In case the builders cannot attend to orders in reasonable time, the company may have work done elsewhere.

The contract between the combine and the German companies was in effect as follows: The purpose of the contract is to insure mutuality of interests and to form "a defensive and offensive alliance" "against the encroachments of outside competition." Accordingly these means are adopted: (1) Each party agrees not to acquire, directly or indirectly, shares of the other, but the German lines will pay over to the combine annually, the sum the combine would receive if it owned not to exceed one-quarter of the stock of the German lines (each German company is capitalized at 100,000,000 marks), and the combine will in return guarantee to pay the German lines 6 per cent. on an identical amount. (2) If either party desires to charter additional ships it will give a preferential opportunity to the other. (3) If either party establishes a new line, or develops an old line to the extent of doubling the sailings, the other party shall be entitled, upon the payment of 5 per cent. interest upon one-third of the amount of capital involved, to assume one-third of the total profits or losses resulting. (4) The combine will not touch at German ports without consent of the German companies; nor will it allow more than two of its North Atlantic traders each week to touch at French ports; but if the German companies increase their sailings from French ports, the combine may make proportionate increase. Reciprocally, the North Atlantic traders of the German companies will not touch at Belgian ports, nor will the total number of calls of all such traders at English ports exceed 300 in each year. But the German companies may nevertheless include English ports in making connections not already established by the combine, and also connect with South American, Mexican and West Indian ports, whether or not such connections have already been made by the combine. By a separate

agreement between the combine and the Hamburg-American line, the latter is exclusively given the traffic between New York and East Asia and between New York and the West Indies. (5) The North Atlantic saloon passenger traffic of both parties—wherein has lain the essential competition between them—will be arranged by a separate agreement, the object being to pool that traffic. (6) In order to carry on the contract in entire harmony, a committee of four will be appointed, two from each party. The decisions by the committee must be unanimous, but in case of their disagreement, appeal will lie to a board of arbitration. (7) The contract shall be void during any war between Germany and the United States, Germany and England, or England and the United States. (8) The contract is concluded for twenty years, but either party may withdraw at the end of eleven years, if amendments deemed desirable cannot be effected. The Hamburg-American line had in 1902, 66 steamers of 352,548 gross tons; and the North German Lloyd had 32 steamers of 233,858 gross tons employed in trade with the United States. The allied interests, when new ships are completed, will have control of about 1,600,000 tons, or about half the tonnage required for our European trade. Because of its better organization and the superior efficiency of its vessels the combine will, it is estimated, be able to conduct fully 60 per cent. of the transportation (except petroleum in bulk) between the United States and Europe. The preceding table gives the speed and tonnage of the fleets of the constituent companies, as reported by the commissioner of navigation in his report for 1902; vessels contracted for since July, 1902, are not included.

SHOOTING. The season of 1902 witnessed such continued expressions of public sentiment against the practice of using live birds as targets in trap-shooting contests, as to make it appear that the end of the custom is at hand. The grand American handicap, the most important event of its kind in the United States, was held April 2-5, 1902, at Kansas City, Mo., and resulted in a tie of 33 men with clean scores. On the shoot-off, "miss and out," H. C. Hirschy, of St. Paul (29 yards), won with 78 straight kills; C. G. Spencer, of St. Louis (29 yards), was second with 77, and R. O. Heikes, Dayton, Ohio (30 yards) third, with 55. The Intercollegiate Shooting Association tournament was held at New Haven, Conn., on May 30, and was won by Harvard with a team score of 210. Yale was second with 195, Princeton third with 178, and Pennsylvania fourth with 154. C. W. Floyd (18 yards), of New York, won the grand American target handicap at Interstate Park, N. Y., on May 8, with a score of 94 targets out of a possible 100.

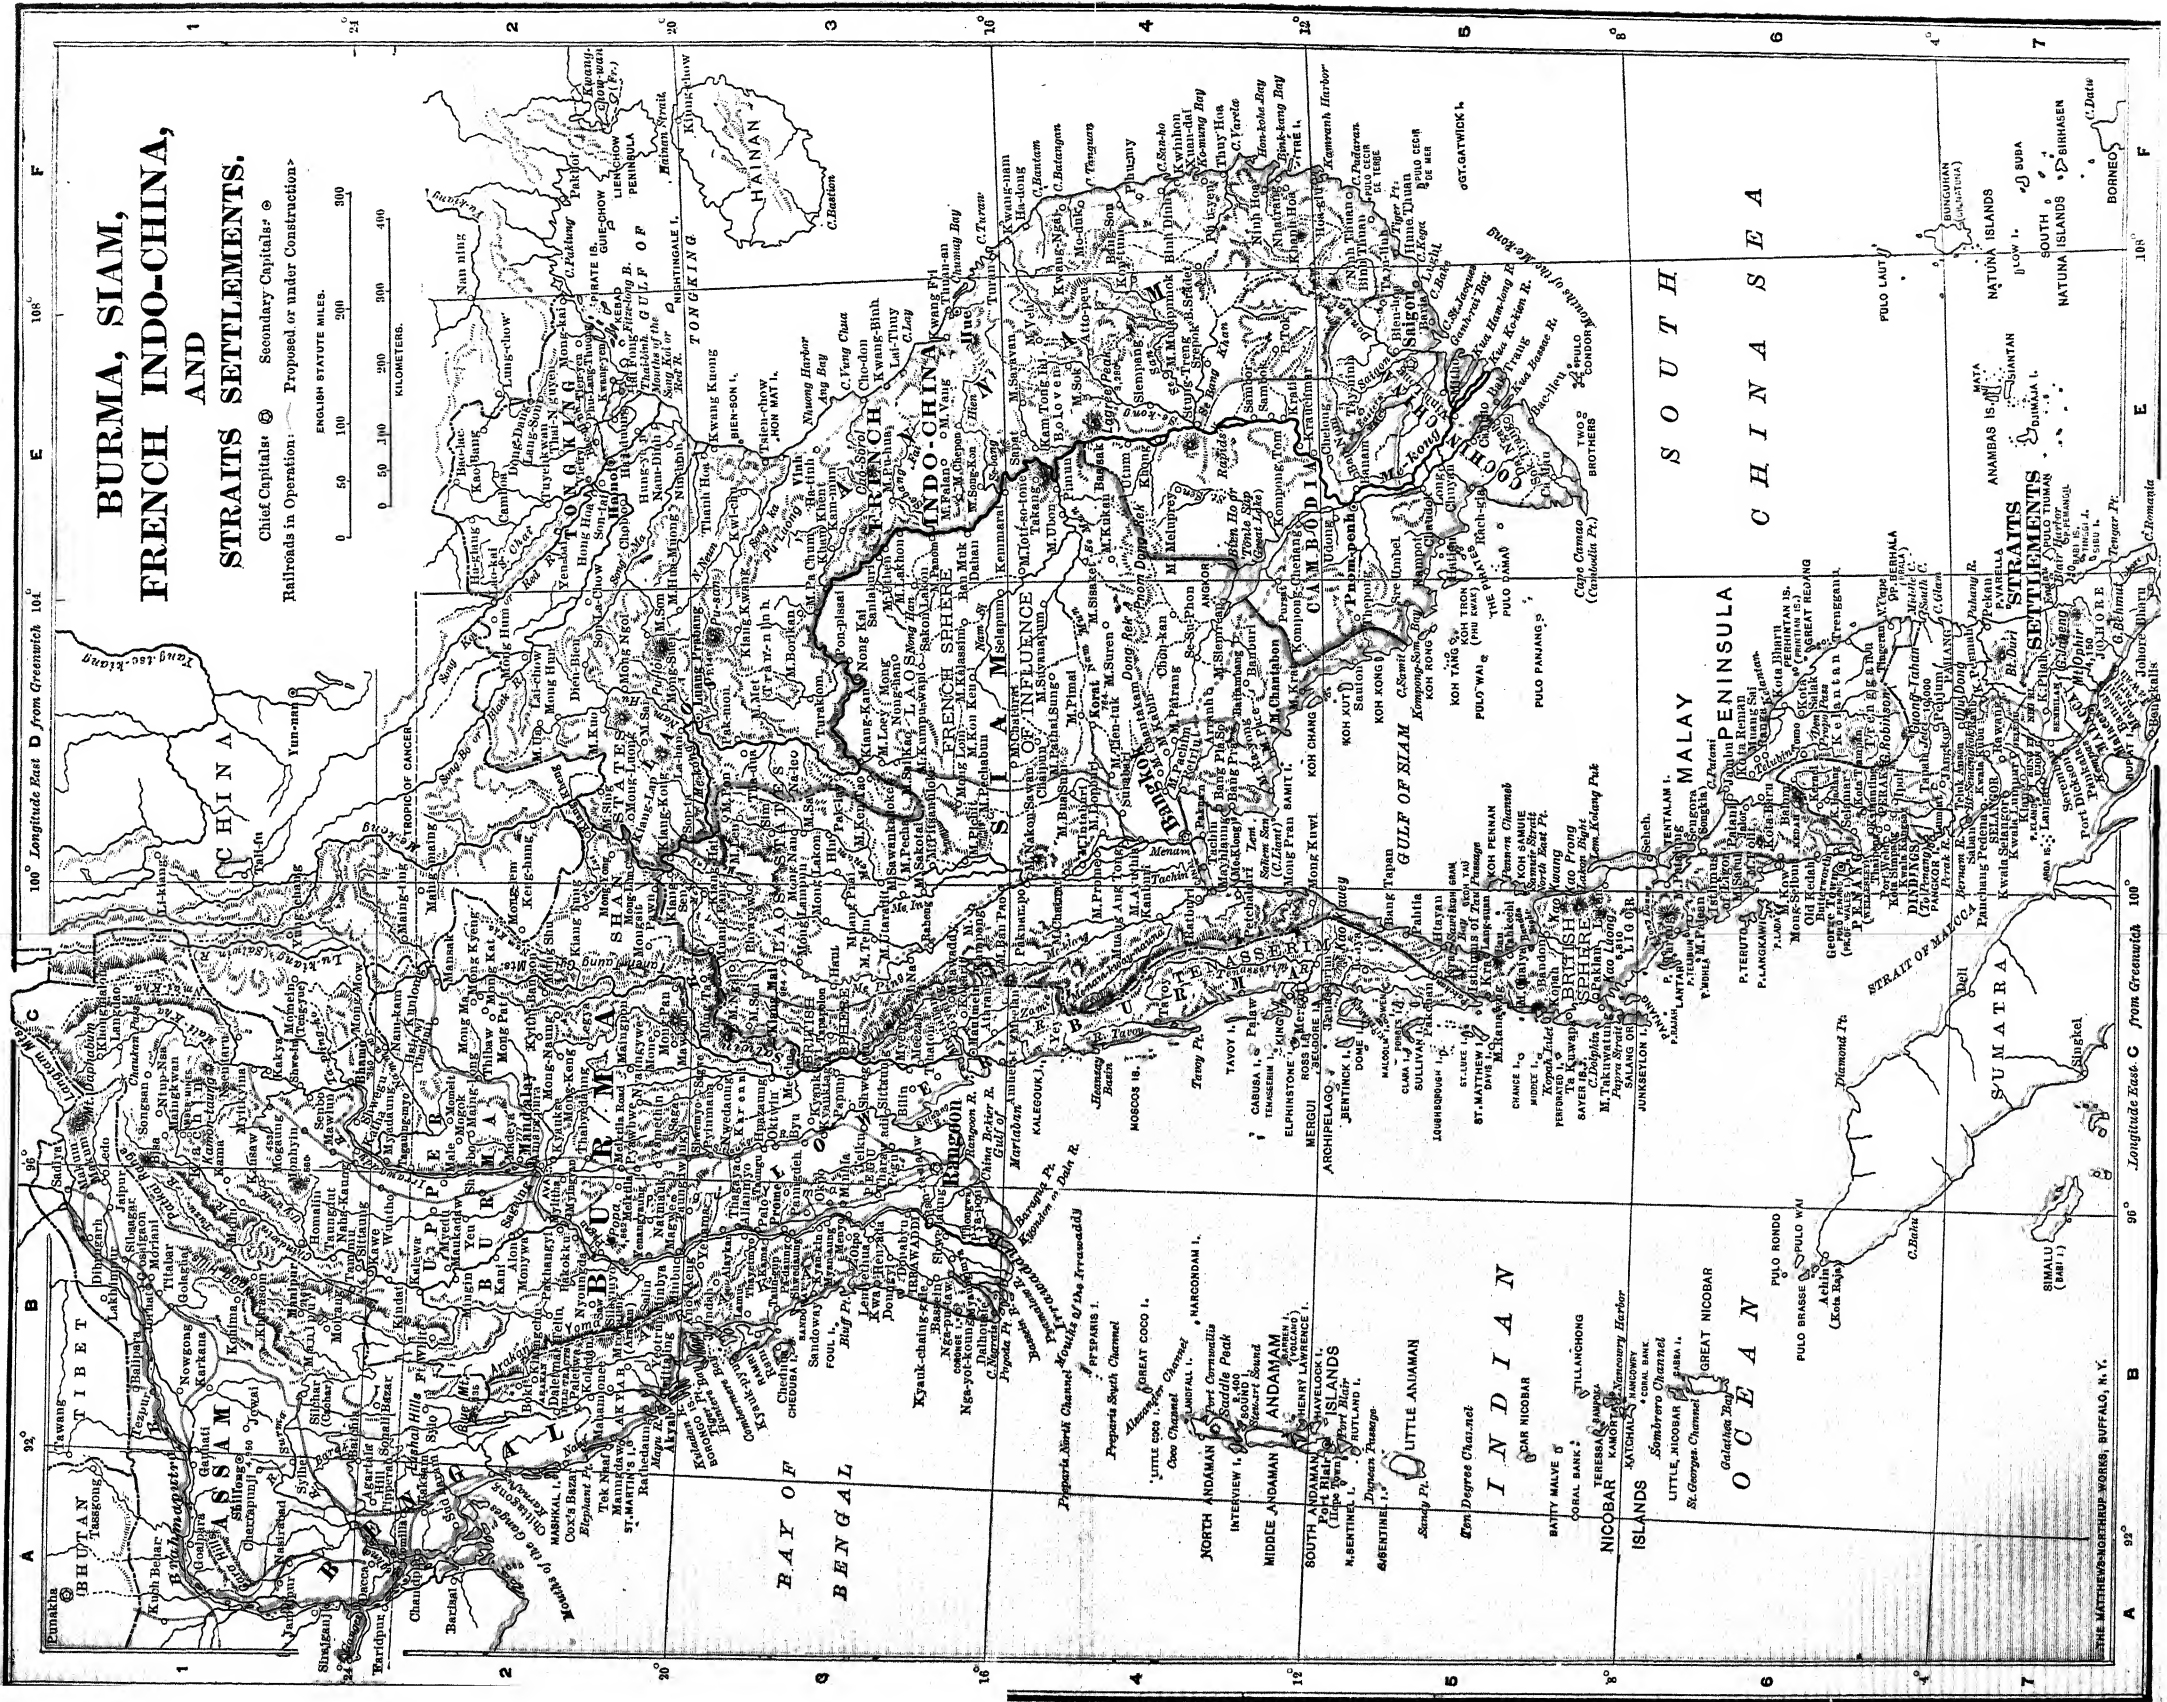

In rifle shooting the most important contest of the year was that for the Palma trophy, representing the championship of the world. It was held on September 13, at Ottawa, Canada, between teams of eight men from Great Britain, Canada, and the United States. The British team won with a score of 1459; second, United States, 1447; and third, Canada, 1373. The contest was at 800, 900, and 1000 yards, 15 shots by each man at each range. The military championships, held under the auspices of the National and New Jersey Rifle associations, were decided at Sea Girt, N. J., August 29-September 6. Some of the contests were as follows, with winners: *Hilton Trophy*, international, teams of 12 men, 200, 500 and 600 yards, 7 shots each, won by New York National Guard, 1137; *Wimbledon Cup*, individual, 1000 yards, 30 shots, won by K. K. V. Casey, Seventy-first Regiment, N. G. N. Y., handicap 18, score 146; *President's Cup*, individual, 200, 300, 500, 600, 800, and 1000 yards, 7 shots each, won by G. E. Cook, First Regiment, D. C. N. G., 189; *Interstate Regimental Team Match*, teams of 12 men, 200 and 500 yards, 10 shots each, won by New Jersey National Guard, 1082.

SIAM, an independent kingdom of southeastern Asia, between Burma and French Indo-China. The capital is Bangkok.

Area and Population.—The area, exclusive of the territory between the Mekong and the Anam hills, which is acknowledged as belonging to France, has been estimated at about 200,000 square miles. The population is variously estimated at from 5,000,000 to 12,000,000, half of the latter figure probably being a conservative estimate. Chinese are increasing rapidly in numbers, especially in Bangkok, which has perhaps 600,000 inhabitants. The Siamese, who are Buddhists, are in general indifferent to Christian missionary effort. Except perhaps in the higher stratum of society the standard of morality is good. Most males are able to read and write.

Government.—The executive authority is exercised by the king, who is advised by an appointed ministry (which is the real power in the state) and an appointed legislative council. The king in 1902 was Chulalongkorn I., who succeeded to the throne as supreme king upon the death of Mongkut in 1868. George Washington, cousin of Chulalongkorn, was second king from 1866 until he died, in 1885, since which time there has been only one monarch. Connected with the governmental administration are about 190 foreigners, of whom about 90 are British and 35 Danish. There is a standing army of 5000 men. The navy is inconsiderable.

Finance.—The principal sources of revenue are customs and taxes on opium, spirits, and gambling. The tax revenues are farmed out, that from gambling largely

to Chinese. The government has adopted the policy of gradually abolishing the taxation of gambling houses. The unit of value is the silver tical, worth 60 per cent. of a Mexican dollar, or 25.02 cents on October 1, 1902. In the fiscal year 1899 revenue and expenditure amounted to 28,496,033 ticals and 23,787,702 ticals respectively; in 1900, 30,022,640 and 27,052,717 respectively; in 1901, 35,611,303 and 31,841,254 respectively. Estimated revenue and expenditure for the fiscal year 1902 were: 36,166,739 ticals and 38,074,288 ticals respectively; for 1903, 39,000,000 and 38,971,271 respectively. There is no public debt and the treasury has a comparatively large balance. In October, 1902, it was reported that the government, with the assistance of the Hong Kong and Shanghai Bank (British), had issued a quantity of legal-tender paper money. This, it was stated, would at first be covered by an actual gold reserve, which, as the credit of the country should become more firmly established, would be diminished and the coin thus withdrawn invested in foreign securities. A measure preliminary to the establishment of the gold standard, which was supported by the British financial adviser to the government, became law on November 27, 1902, when the mints were closed to the free coinage of silver. The value of the tical was fixed (December 12) at one-twentieth of a British sovereign, or 24.325 cents. If the new monetary standard is successful, the profits arising from the minting of silver ticals will be set aside as a special reserve fund for the purpose of establishing a gold currency.

Industry, Commerce, etc.—The principal products are rice, teakwood (of which Siam produces one-fourth of the world's output), sandalwood, rosewood, fruits, and garden produce. The trade of Bangkok, which probably constitutes more than 85 per cent. of the foreign commerce of the country, amounted in 1899 to £2,532,137 for imports and £3,123,775 for exports; in 1900 the imports and exports were valued at £2,576,540 and £3,087,819 respectively; in 1901, £2,805,386 and £4,366,967 respectively. Of the imports cotton goods formed more than one-fifth, and metals and machinery more than one-tenth. The rice export was valued at about £3,444,000. A considerable amount of teak finds its way down the Salween into Burma, but that exported from Bangkok in 1901 amounted to 43,735 tons, valued at £240,864. The commerce is largely with Great Britain and Germany.

A railway, a private line 17 miles long, connects Bangkok with Paknam. A government line connects Bangkok with Khorat, 165 miles distant; from a point on this line, 57 miles from Bangkok, a branch line is in operation to Lopburi, 26 miles. An extension of this line to Chiangmai in the northwest (about 600 kilometres, or 373 miles) is under construction. Another government line, running from Bangkok southwest to Pechaburi via Ratburi, was under construction in 1902 and, it was hoped, would be completed in the following year. Up to the end of 1901 the government had expended over 26½ million ticals on railways.

Native Outbreaks.—It was reported that on April 21, 1902, 15,000 Siamese rebels, of whom 300 were armed with rifles, fled across the Mekong and attacked the French post of Savan Nakhek. They were repulsed and pursued by the French, who entered protest with the Siamese government. The latter disclaimed responsibility for the acts of outlaws and rebels. Later in the year more serious outbreaks, farther to the north, were reported, due apparently to exactions of government agents. Early in August news came that 600 Shan tribesmen had seized the town of Muang Pray and killed twenty-five Siamese civil officials. About 2000 troops were dispatched thither and several encounters took place, but in November the insurgents were entirely routed.

France and Siam.—The forward policy of France, whose ambitions are supported by Russia and only weakly protested against by Siam's real but quiescent friend, Great Britain, seemed in the summer of 1902, to contemplate the annexation to Indo-China of all the territory in the eastern part of the country not guaranteed to Siam by the Anglo-French agreement of 1896. But on October 9, 1902, there was signed at Paris a treaty between France and Siam which, if ratified, would indicate a less aggressive policy on the part of the French. What amounts to French encroachment upon Siam dates from 1893. After an unwarrantable course of action, notably the fight at Paknam, into which the Siamese were tricked, France took over by the treaty of October 3, 1893, most of the territory east of the Mekong, exacted from Siam a pledge to exert no military force within 25 kilometres of the right bank of that river, and occupied "temporarily" the port of Chentabun. By the above-mentioned agreement of 1896 the integrity of the most valuable part of Siam, the Menam Valley, was guaranteed. But in 1902 the French still held Chentabun; they were making trouble within the 25-kilometre radius, where Siam is helpless; they were enrolling by the thousands natives and Chinese—especially the immigrants from Hainan, which France is seemingly waiting only a pretext to annex—as French "subjects"—all with the apparent purpose of building a French colonial empire from China and the China Sea to British Burma.

The treaty of October 9, which was signed after considerable diplomatic friction

during the preceding summer, gained for France much less than it was supposed she would eventually take. The treaty defined the frontier between Siam and Cambodia, and the frontier between Luang Prabang and the Siamese provinces of Muang Nan and Muang Phichai; it provided for the transfer to France of the provinces of Meluprey and Bassak and the territory east of the above-mentioned frontiers, and for the evacuation by the French, upon such transfer, of the port of Chentabun; it abolished the 25-kilometre restriction upon the Siamese in regard to the Mekong, but provided that if Siam should wish to send troops into her part of the Mekong basin they must be of Siamese nationality and under command of Siamese officers; it also provided that should Siam wish to construct public works, especially railways, in the Mekong basin she must first come to an agreement with France unless such public works can be carried out exclusively by Siamese capital and labor; it finally provided that persons of Asiatic origin born in French territory and resident in Siam are, with their children, but not their grandchildren, under French protection. The territory ceded to France by the treaty has been estimated at upwards of 7700 square miles. The treaty immediately encountered adverse criticism on the part of the colonial group in the French chamber. The imperialists promised serious opposition to its ratification, since, as they declared, the convention guaranteed Siam a larger amount of independence than was assured her under the treaty of 1893. In view of this dissatisfaction, M. Delcassé, the French foreign minister, in December succeeded in negotiating an additional clause, whereby Siam engaged to erect no new fortifications in the provinces of Bat-tambang and Siam-reap, or within 25 kilometres of the right bank of the Mekong.

SIBERIA, a part of Asiatic Russia, has an estimated area of 4,833,496 square miles. The population, which, according to the census of 1897, was 5,727,090, has probably risen to 7,000,000, owing to recent heavy immigration. The average annual immigration from Russia is about 250,000. The principal cities are Tomsk, Tobolsk, Irkutsk, Blagovestchensk, and Vladivostok. Dalny, in Manchuria (*q.v.*) appears to be superseding Vladivostok in importance. The principal agricultural products are wheat, rye, oats, barley, buckwheat, and potatoes. The forests are of enormous extent, but have scarcely been touched except in the valley of the Yenisei. The deposits of gold are extensive, and gold-mining employs about 50,000 persons. Silver, copper, iron, zinc, and coal are also found. The fur trade is of great importance.

Work on the Trans-Siberian Railway was continued throughout the year 1902, and comprised largely the relaying of long stretches of track which, owing to the haste of construction and the dishonesty of contractors, revealed formidable defects. Wooden bridges were replaced by structures of iron, and many miles of double track were laid. Trains are still carried across Lake Baikal by steamers, but the difficulties of winter navigation, when ice-breaking boats must be employed, have led to the survey of a route around the southern end of Lake Baikal, which was completed in the spring of 1902, after four years of work. The line is to run close to the shore of the lake to the village of Kultuk, whence the road will be prolonged to Myssovaya, on the Trans-Baikal section of the railway. It was planned also to parallel the main line from Omsk to Tiumen. At a conference of the representatives of the principal European railway lines, held in Paris late in 1902, it was announced that with the opening of the Eastern China Railway in 1903 uninterrupted communication would be established from western Europe to the Pacific. The first-class fare for the entire line was fixed at about \$80.

SIDI ALI, Bey of Tunis, died June 11, 1902. He was born in 1817, and succeeded to the throne in 1882. In that year Tunis was made a French protectorate, and the administration was thoroughly organized in law, finance, and public works. Sidi Ali belonged to a family that has ruled Tunis for more than two hundred years; but the French protectorate has curtailed the power of the Bey. Apart from the organization of the protectorate, the reign of the late ruler was uneventful.

SIGEL, FRANZ, a German-American soldier, died in New York City, August 21, 1902. He was born in Sinsheim, Baden, November 18, 1824, and graduated in 1843 at the military school of Carlsruhe. During the revolution of 1848-49 in Baden he was an active figure, serving as secretary of war, and as adjutant-general with General Microslawski, and commanding the army during its retreat to Switzerland. He came to the United States in 1852, and taught in a private school until his removal in 1858 to St. Louis, where he became director of the public schools. At the outbreak of the Civil War he became colonel of the Third Missouri Volunteers and brigadier-general of volunteers soon afterward, and early displayed his military genius by winning the battle of Carthage. At the battle of Pea Ridge he commanded two divisions, was made major-general of volunteers in March, 1862, and in the following September took command of the Eleventh Army Corps. The eleventh and twelfth corps of Burnside's command were given him in 1863, and in 1864 he was placed at the head of the department of West Virginia. Owing to a defeat at

New Market at the hands of General Breckinridge he was relieved of his command over the army of West Virginia, but in July, 1864, made a gallant defence of Maryland Heights against a greatly superior force. He resigned in May, 1865, and edited the Baltimore *Wecker* until his removal to New York in 1867. In 1869 he was the unsuccessful Republican candidate for secretary of state, was elected register of New York City in 1871 with the support of the reform Democracy, and by appointment of President Cleveland was U. S. pension agent in New York from 1885 to 1889. At the time of his death he was editor of the *New York Monthly*.

SIERRA LEONE, a British crown colony on the west coast of Africa between French Guinea and Liberia, has an area of about 4000 square miles and a population (1901) of 76,655, of whom 493 were resident Europeans. The capital is Freetown, the greatest seaport in West Africa. The Sierra Leone Protectorate, forming the hinterland of the colony, has an estimated area of 30,000 square miles and an estimated population of 1,000,000. The colony is administered by a governor (Sir Charles Anthony King-Harman since 1900), who through commissioners also controls the protectorate. In 1900 revenue and expenditure amounted to £168,668 and £156,421, respectively; in 1901, £192,138 and £173,457, respectively. Customs are the largest source of revenue. Imports and exports in 1900 were valued at £558,271 and £362,741, respectively; in 1901, £548,286 and £304,010, respectively. Most of the exports, comprising palm kernels, cola nuts, palm oil, rubber, and ginger, are brought from the hinterland. Adverse trade conditions have been due largely to severe restrictions in the neighboring French territory; it is expected, however, that economic conditions will be greatly improved through railway construction. A railway is building from Freetown to Bo; early in 1902, 76 miles were open to traffic, and the work was proceeding steadily. Efforts have recently been made to establish schools for Mohammedans, who, it is hoped, without reference to their religious belief, may be trained in British civilization and ideas. Slavery is virtually extinct. In the protectorate it appears that there is no longer any serious objection to the payment of the hut tax, which was the principal cause of the native insurrection of 1898. According to a British authority, this tax has come to be regarded by the natives as "a cheap equivalent for the blessings of good government," and there have been few recent cases where pressure was needed for its collection.

SILK INDUSTRY. The silk industry was fairly active during 1902, especially in the United States, where the imports of raw silk were greater than ever before. The exports from Japan and China during the silk season of 1901-02 (July 1 to June 30) were greater than in the previous season, as will be seen from the following statistics:

EXPORTS FROM	1900-1901 Kilogrammes.	1901-1902 Kilogrammes.
Shanghai (including Tussah).....	4,620,100	5,042,700
Canton.....	1,964,600	2,136,000
Yokohama.....	4,121,900	4,504,900
Total.....	10,706,600	11,683,600

In Europe the crop was considered hardly an average one, and comparatively high prices were demanded for the raw silk, while reports were circulated of a shortage in the Shanghai product. This led to a gradual rise in prices, so that at the end of the year raw silks and silk products were higher than at the beginning. The estimate of the world's crop, prepared by the Silk Association of Zurich, indicates a decrease in the product for the year, as may be seen from the following table:

WORLD'S PRODUCTION OF RAW SILK.

SILK SEASON.	Kilo-grammes.	Pounds.	SILK SEASON.	Kilo-grammes.	Pounds.
1897-1898.....	14,123,000	31,135,565	1900-1901.....	16,148,930	35,600,000
1898-1899.....	11,430,000	31,812,378	1901-1902.....	17,127,000	37,767,784
1899-1900.....	16,767,000	36,964,528	1902-1903.....	16,687,000*	36,778,160

*Estimated.

The silk market in general depends upon national prosperity, consequently far greater activity was experienced in the United States, where business conditions were good, than in Germany, where an industrial depression marked the year. Elsewhere in Europe conditions were hardly normal; so to the United States one must look for the most active business. Here the imports for the year were not only greater than in 1901, but were again the largest ever recorded, the increase being distributed among all the countries supplying the United States with raw silk except

Japan, from which about one-half the supply is received. The imports for the calendar year, as compared with those of the previous year, are as follows:

YEAR ENDING DEC. 31.	1901			1902		
	Bales.	Pounds.	Inv. Value.	Bales.	Pounds.	Inv. Value.
Strictly European.....	20,105	2,680,740	\$10,166,584	23,877	3,183,520	\$12,633,941
Asiatic reshipped by Europe...	126	16,874	38,107	753	100,384	239,636
Japan.....	49,636	6,618,136	21,945,104	45,762	6,101,466	21,591,282
Canton.....	5,424	723,188	1,816,695	8,262	1,101,487	2,889,138
Shanghai.....	14,900	1,986,608	6,277,843	18,240	2,432,025	7,810,165
Total picul bales*.....	90,191	12,025,546	\$40,244,333	96,894	12,918,882	\$45,164,062

*133¼ pounds each.

The most conspicuous feature of the year was the strike of the silk dyers in Paterson, N. J., during April, May and June. This necessitated the closing of the mills and the throwing out of employment of many operatives, and the consequent curtailment of production. This was estimated at \$9,000,000 worth of finished goods, and was severely felt by the consumers, though it of course tended to keep prices up.

The following table, prepared by Messrs. Chabrieres, Morel and Company, of Lyons, is interesting as showing the raw silk production of the world, together with the extent to which the material is manufactured by the various countries. The table is based as far as possible on 1901-02 statistics:

	Production.	Consumption.
EUROPE.	Kilogrammes.	Kilogrammes.
France.....	700,000	4,000,000
Italy.....	4,412,000	1,000,000
Switzerland.....	50,000	1,550,000
Spain.....	82,000	200,000
Austria.....	204,000	725,000
Hungary.....	115,000

Algeria and Tunis.....	75,000
Other countries and balance.....	596,000
	33,091,000	33,091,000

SILVER. The most striking feature of the silver mining industry in 1901 and 1902 was the maintenance of a high rate of production, in spite of the steady decline in the market price of the metal. The average price of silver at New York for 1900 was 61.33 cents per ounce; for 1901, 58.95 cents, and for 1902, 52.16 cents per ounce, while the monthly averages show a falling off from 64.14 cents for December, 1900, to 48.03 cents for December, 1902. This marked decline was due to the decreased demand for silver for coinage purposes, especially in China and India, and it is not probable that there will be any improvement in the situation within the immediate future. On the other hand, the payment of the Chinese indemnity will necessitate the export of silver from that country to an extent that is likely to unsettle the market conditions throughout the world. The fact that the metal is produced mostly as a by-product in the smelting of gold, lead, and copper ores is the cause of the large output during periods of marked depression. The world's production of silver in 1901 is estimated by *The Mineral Industry* at 170,565,304 ounces. The output in 1902 probably showed a small increase.

The production of silver in the United States in 1901 and 1902 (estimated) is shown in the following table, compiled by the bureau of the mint:

	1901		1902	
	Troy Ounces.	Commercial Value.	Troy Ounces.	Commercial Value.
Alaska.....	47,900	\$28,740	56,719	\$30,061

SIMAR, HUBERTUS, Roman Catholic archbishop of Cologne, Germany, died in that city, May 24, 1902. He was born in Eupen, Rhenish Prussia, in 1835, and after theological training at Bonn and Munich, was called to the chair of Catholic theology at the former university in 1864, and in 1880 assumed there the professorships of dogmatics and apologetics. While bishop of Paderborn, a dignity to which he was elected in 1891, he displayed great patriotism and was prominent among the advocates of German naval expansion; and at the death of Cardinal Krementz in 1899 succeeded to the see of Cologne. He was installed in 1900.

SIMMONS COLLEGE, Boston, Mass., was established in 1899, in accordance with the provisions of the will of John Simmons, of Boston (a merchant who died in 1870), as an institution in which instruction in such branches of art, science and industry might be given as would best enable women to earn an independent livelihood. It was opened in 1902 under the presidency of Henry Lefavour, Ph.D., LL.D., the first class numbering 146. It offers a complete course of four years, shorter technical courses for students having adequate preliminary training, and partial courses. Instruction was begun in October in household economics, secretarial work, library training and science preparatory for teaching, for medicine or for nursing, and other departments are to be added. The college has under consideration plans for departments of applied art, nurse training, and agriculture and horticulture. For the first year a part of the instruction is given in the Massachusetts Institute of Technology and a part in the college house in St. Botolph Street. The permanent college buildings will be erected on the Parkway in the Back Bay Fens. The tuition fee is \$100. The faculty in 1902 numbered 25, of whom several were officers of the Institute of Technology. The endowment was \$2,052,000, the building fund \$750,000, and the gross income \$112,000.

SIMPLON TUNNEL. See **TUNNELS**.

SKATING. In ice-skating the speed championships of the United States and Canada were decided at Verona Lake, N. J., January 31 and February 1, 1902. The different events were won as follows: Half-mile, P. Sinnirud, Verona Lake, 1 minute 25-2-5 seconds; one mile, M. Wood, Verona Lake, 3 minutes 7-1-5 seconds; three miles, M. Wood, 10 minutes 19-4-5 seconds; five miles, P. Sinnirud, 17 minutes 17-3-4 seconds; ten miles, P. Sinnirud, 37 minutes 4-1-5 seconds. The National Amateur Skating Association held its novice figure-skating contest at the St. Nicholas Rink, New York City, March 20, and the contest for seniors at the Clermont Avenue Rink, Brooklyn, N. Y., on March 21. The former was won by W. Valentine, New York City, with a total of 46 points, followed by I. A. Sankey and A. C. Brown, both of Brooklyn, with 42 points. In the senior event the winner was W. F. Duffy, of New York City, with 104 points; second, I. A. Sankey, 83 points, and third, W. Valentine, 77 points.

SLEEPING SICKNESS. The School of Tropical Medicine has issued a report on sleeping sickness, which in 1902 was devastating Uganda. Though it was recognized only a few years ago, it is estimated that 20,000 to 30,000 persons have already perished from it, and the disease is spreading with increased virulence. Egypt is threatened if it spreads north. Scientific reports describe sleeping sickness as probably a meningitis. It is almost invariably fatal. It is contagious and its spread is assured by the crowding of many individuals in the same huts. Its large death rate in many large and thickly populated districts makes the outlook very gloomy.

Prevention of the spread of the disease is secured only by isolation of the cases. Lately a bacillus, or diplobacillus, has been described by Broden as the cause of sleeping sickness. Van den Corput believes that the disease is due to the accumulation of toxins in the system; and Alexander Crombie, in the *Journal of Tropical Medicine*, narrows down the cause of the symptoms to disease affecting the glands which receive the lymph from the brain as the only ones whose obstruction would presumably give rise to the phenomenon of somnolence. This writer suggests that the deep cervical glands are the most likely seat of the essential condition, which is probably caused by the presence of the parental form or the aborted ova of filaria perstans. Still another theory is advanced by Hans Ziemann, who believes that the disease is caused by a toxic material ingested with manioc (or cassava) taken as food. This is not poisonous if properly cooked, and the author believes the disease will disappear if general instructions as to the preparation of manioc are given to the population. He considers sleeping sickness an intoxication like pellagra, a malady engendered by eating partially fermented grain.

SMITH COLLEGE, Northampton, Mass., founded 1871, an undenominational institution for the higher education of women, had in 1901-02 a student registration of 1048 and 90 instructors. The income for the year was \$308,000, and the gifts to the college were greater than during any previous year of its history, amounting to \$211,000. The most noteworthy financial event of the year was the successful effort to meet the condition of Mr. J. D. Rockefeller's offer of \$100,000, half to be added to the general endowment fund and half to be applied to the erection of an assembly hall, provided the friends of the college would raise an equal amount. As a result of the movement \$113,187 were raised, of which undergraduates contributed \$7000, and \$44,500 were received through the alumnæ committee. The new requirements for admission went into effect at the beginning of the year, and only those were admitted who were prepared to pursue courses leading to the degree of A.B. The effect of the new schedule, as was anticipated, was to lessen the number of students who were able to pass the examinations.

SMOKE PREVENTION. The shortage of anthracite coal due to the coal strike of 1902, with the consequent greatly increased use of soft coal, made the smoke nuisance in some cities almost unbearable; and in others, where soft coal had been but little used, the first real trouble with the smoke evil was experienced. The progress of smoke prevention efforts can best be studied in some city where the use of soft coal is the rule rather than the exception. St. Louis falls in this class. In 1901 State and municipal legislation was secured which resulted in the establishment of an organized smoke abatement department, with Mr. C. H. Jones as chief smoke inspector. The legislation in question prohibited the discharge of dense smoke into the open air within the corporate limits, declared such discharge a public nuisance, and provided a penalty of not less than \$25 nor more than \$100 for proved violations of the ordinance, or for interference with the smoke inspectors while in the discharge of their duties.

SOAPSTONE. See MINERAL PRODUCTION.

SOCIALISM. Several years ago the terms socialist and anarchist stood for exactly the same idea with people generally. The socialists have taken particular pains to show their utter disagreement with the anarchists as to the ultimate end to be attained. It is true that the two in principle are diametrically opposed; and in the means employed for putting in operation their schemes, the two movements have nothing in common. But the effect produced by the socialist propaganda upon the inflammable masses does not differ much from that produced by the doctrines of anarchism. The riots and bloodshed in Belgium, Italy, and Sweden are the ripened fruit of the doctrines of revolutionary socialism. The socialists preach universal brotherhood and love on one hand, and the universal "Klassenkämpfe" and oppression by the capitalists on the other. The notion is prevalent that the socialists have receded from their revolutionary principles and are cooperating with every party favoring a larger measure of public control. This is not quite true. For some years there was a movement toward "opportunism" or "state socialism," i.e., a willingness to support the candidates of any party supporting any measure of a socialistic tendency. A strong reaction has set in, and now the out-and-out socialist is even more bitter against the "opportunist" than against the bourgeoisie.

Socialism in the United States.—The socialist movement has never had a strong hold on the laborers in America for obvious reasons. The first national socialist campaign in the United States was in 1888, when a vote of 2068 votes was cast. In the congressional elections of 1890 they cast 13,331 votes; in 1892 the vote rose to 21,157; in 1894 to 33,133; in 1896 to 46,564; and in 1898 to 91,749. At this point the party split; the radicals, retaining the name Socialist Labor party, attacked the trade unions because they were too conservative. The other branch, which is called the Socialist party, or the Social Democratic party in New York State, supports the

trade unions and conducts a campaign of propaganda and education. In the presidential election of 1900 the Socialist Labor party polled 34,191 votes, while the Social Democratic party, with Eugene V. Debs and Job Harriman to head the ticket, polled 97,730. In 1902, the vote rose to 231,425, a gain of 137 per cent. The following is the vote by States for 1900 and 1902:

STATE.	1900	1902	STATE.	1900	1902
California.	7,572	9,592	Nebraska	823	3,157
Colorado	684	2,857	New Hampshire. . .	790	1,037
Connecticut.	1,741	2,837	New York..	12,869	25,000
Idaho	1,800	North Dakota ..	518	1,245
Illinois	9,687	20,167	Ohio	4,847	14,370
Indiana	2,374	7,134	Oklahoma	815	1,963
Iowa	2,742	6,360	Oregon.	1,494	3,532
Kansas	1,605	3,246	Pennsylvania	4,831	21,910
Kentucky	760	1,665	South Dakota	169	2,738
Maine	878	1,974	Washington	2,006	4,739
Massachusetts	9,716	33,629	Wisconsin	7,096	15,957
Minnesota	3,065	10,129	Wyoming	552
Missouri	6,128	5,335			

The heaviest vote was cast in Massachusetts, where the vote was nearly quadrupled. As was to be expected, the socialist vote of Pennsylvania was especially heavy, showing a gain of over 400 per cent. These members of the Socialist party were elected to the Massachusetts legislature: James F. Corey, Frederick MacCartney, and William C. Ransden, of Brockton. The first two are re-elected for the third or fourth time, but the last named is elected for the first time. In Brockton, Mass., the mayor, Charles H. Coulter, three of seven aldermen, eight of twenty-one councilmen, and two of three school committeemen are socialists. The town of Haverhill again elected a socialist mayor in spite of the combined opposition of both old parties. Also two councilmen, a school committeeman, and an assistant assessor were elected. Other officers chosen by the Socialists were: In New Castle, Pa.; Marion and Liston, Ind., one councilman each; Battle Creek, Mich., three aldermen; Sheboygan, Wis., four out of sixteen aldermen; Montana, five members of the legislature. Aside from political work, the party has been active. The more radical western trade unionists split off from the American Federation and formed the American Labor Union, which includes nearly all the western miners' unions, with headquarters at Butte, Mont., where the official organ of the movement, the *American Labor Journal*, is issued. *The Worker*, published at 184 William Street, New York, is the official organ of the Social Democratic party of New York. The remnant of the Socialist Labor party still keep up an organization and publish a paper called the *Daily People*; but the party is losing strength and standing. H. Gaylord Wilshire has increased the circulation of his magazine very greatly, and a new illustrated monthly of considerable literary and artistic merit was started during 1902 in New York City. *The International Socialist Review*, a monthly published in Chicago, is the leading organ of the movement in the United States. The Social Democratic party, which is the only socialist party in the United States having appreciable strength, has a propaganda similar to that of socialists everywhere. Their aim is to get control of the machinery of government and by legislation to put their scheme of public ownership into operation at once. Their platform for 1902 demands: (1) The public ownership of all means of transportation and communication and all other public utilities, as well as of all industries controlled by monopolies, trusts, and combines; no part of the revenue of such industries to be applied to the reduction of taxes on property of the capitalist, but to be applied wholly to the increase of wages and shortening the hours of labor of the employees, to the improvement of the service and diminishing the rates to consumers; (2) the progressive reduction of the hours of labor, and the increase of wages; (3) State or national insurance of working people in case of accidents, lack of employment, sickness and want in old age, the funds for this purpose to be furnished by the government, and to be administered under the control of the working class; (4) the inauguration of a system of public industries, public credit to be used for that purpose; (5) the education of all children up to the age of eighteen years, and State and municipal aid for books, clothing and food; (6) equal civil and political rights for men and women; (7) the initiative and referendum, proportional representation, and the right of recall of representatives by their constituents.

"But in advocating these measures as steps in the overthrow of capitalism and the establishment of Cooperative Commonwealth we warn the working classes against the so-called public ownership movements as an attempt of the capitalist class to secure government control of public utilities for the purpose of obtaining greater security in the exploitation of other industries and not for the amelioration

of the conditions of the working class." That the doctrine of socialism is spreading rapidly among the workingmen is shown by the vote on the resolution introduced by the socialists looking toward the organization of the labor unions into a socialist party in 1903. The resolution was defeated by a vote of 4865 to 4203, the largest vote for socialism yet recorded in the convention of the American Federation of Labor.

Socialism Abroad.—The drift toward "opportunism," so marked a few years ago during the good times, was suddenly checked during 1901 and was almost entirely wanting in 1902. In France the Ministerialist convention held at Tours was so slimly attended that the management refused to give out the list of delegates. The union of the French socialists to support measures of government looking toward the amelioration of present conditions is no longer considered possible, and Jaurès, who was once the leader of this movement, is now opposed to ministerial socialism. The general elections in France found five distinct socialist tickets in the field, while many doubtful candidates called themselves socialists. The count revealed 860,722 straight socialist votes. The number of socialist representatives in the Chamber of Deputies was increased from 43 to 47 out of a total of 581. The national convention of the Parti Socialiste de France was held in Commeny, September 26 to 28. The Socialist party of Germany in 1902 gained strength enormously because of the Agrarian tariff measure. The party now has one central organ, *Vorwärts*; one scientific review, *Neue Zeit*; fifty-four dailies, ten tri-weeklies, four bi-weeklies, nine weeklies, three fortnightlies, two monthlies, and one woman's paper. The national convention was held September 14, when the election campaign was planned. Large gains were made in the voting strength of the party. The attempt in England to unite the Independent Labor party and the Social Democratic Federation with the Fabian Socialists has not proved successful. The Social Democratic Federation, consisting of the most radical men, soon split off, and it and the I. L. P. held separate national conventions in 1902. A considerable increase in numbers was reported. The trade unions held their annual convention on September 6. A resolution introduced by the Socialists was passed declaring for the collective ownership of the means of production, but the proposition to send delegates to the international congress of Socialists, to be held at Brussels in January, 1903, was rejected. In Italy the Zanardelli ministry came into power through the vote of the Socialists because it was fighting against the attempt to deprive laborers of the right to organize. Discord speedily arose, of course, between the ministry and the more radical Socialists, and *Le Mouvement Socialiste* declared "the harmony between the Socialists and the ministry is ended, and the Socialist group in Parliament no longer soils its conscience with votes of confidence in a bourgeois ministry." The king of Italy declared himself to be a "Socialist" and prepared a detailed programme of nationalization and municipalization. The national convention of the Italian Socialist party was held at Ancona, September 6 to 8. The resolution offered by the Radicals, declaring for independent and revolutionary action, was defeated by a vote of 456 to 279. Resolutions were then passed by the same vote, indorsing the policy of opportunism. There were reported 1336 local Socialist clubs with a total membership of 51,415 in Italy, with some scattering members in other countries. The growth in members has been moderate. The elections in Switzerland showed heavy gains for the Socialist party, though no special reason can be assigned for this drift. Socialism in Belgium for the time being is identified with the movement for universal suffrage. The Socialists in the Parliament demanded that every adult man be given the ballot. In case of refusal, they threatened a general strike of workmen. The measure was delayed by the government party, whereupon the Socialists "assisted the deliberations by public demonstrations in which from 50,000 to 200,000 inhabitants of Brussels took part," as a leading Socialist paper put it. The result was terrible rioting and violence. When peace was restored the measure for universal manhood suffrage was defeated by a vote of 84 to 64. The more judicious Socialists admit that the cause has been seriously injured by these violent demonstrations. Strictly speaking, organized socialism cannot be said to exist in Australia. As a fact, however, the labor unions have practically adopted the Socialist programme. The political aims of the Labor Federation of Queensland are: (1) The nationalization of all sources of wealth and all means of producing and exchanging wealth; (2) the pensioning by the State of every child, invalid, and aged person; (3) the just division among all the citizens of all wealth, less that part required for public and common needs; (4) the reorganization of society upon the above lines, to be begun at once and pursued uninterruptedly until social justice is fully secured to every citizen. The difference between this and the Socialist programme is too minute to be discerned. The election in March, 1902, resulted in a choice of 24 labor members of the legislature against 41 chosen by the Capitalist party. In New South Wales the labor unions refused to be identified with the Socialistic movement, but elsewhere

the Socialist element seems to be leading the labor organizations into the Socialist camp. In Victoria, the following programme was adopted by the labor council: (1) One vote to each adult; (2) initiative and referendum; (3) exclusion of undesirable races; (4) old age pensions; (5) uniform industrial legislation; (6) gradual nationalization of the means of production.

SOCIAL SERVICE, AMERICAN INSTITUTE OF, founded in New York in 1902 as an outgrowth of the League of Social Service. The functions assumed by the institute are: To gather from all possible sources facts of every kind which bear on social and industrial betterment; to interpret these facts by ascertaining their causes and effects; for the education of public opinion. The several departments of the institute are as follows: (1) Bureau of information for answering all inquiries concerning industrial and social betterment and many other topics. (2) Investigation. This department when fully equipped will have a corps of trained investigators, capable of making a scientific study of social problems. (3) Illustration, which includes photographs, diagrams, plans of model tenement houses, etc., illustrating industrial and social conditions, and what is being done to improve them. (4) Publication includes the issue of a monthly review, leaflets, and material for the press. (5) Legislation, under which a collection will be made of the laws of civilized States dealing with social and industrial problems. (6) The lecture bureau to be endowed with traveling lectureships for the education of public opinion concerning the objects of the league. (7) Training school for social secretaries, a new profession made necessary by changed conditions of modern industry. (8) Library and archives, which will specialize reports of societies, institutions, and literature dealing with social and industrial problems. (9) The department of security, looking to a lessening of the cost of life and limb and of health in the production of the necessities, conveniences, and luxuries of civilization. (10) Personal study and research, made available through the institute. (11) International relations for the service of foreign students and tourists. The institute received its charter from the Board of Regents of the State of New York, December 4, 1902, and consists of its 29 incorporators. The associates are men and women who are distinguished for their public services, and known to be deeply interested in social improvement. On the recommendation of the executive committee they are elected for one year to the number of one hundred, and are eligible for re-election. Collaborators are selected from distinguished students of social subjects, and are elected to the number of fifty for one year by the institute. They are also eligible to re-election. President, Josiah Strong; director, William H. Tolman; recording secretary, E. A. McAlpin, Jr., 287 Fourth Avenue, New York City.

SOCIOLOGY. The year 1902 was rich in the literature of sociology, though no epoch-making books appeared. Among general works of sociology must be placed among the first that of the late Professor Daniel G. Brinton, *The Basis of Social Relations*. This book gives the author's well-known theory of the psychological unity of man. The individual mind is but the reflex of the group mind, as his body in every fibre and cell is the repetition of his species and race. The group mind is not a sum of individual minds, but is a distinct entity, though it exists only in individual wills. Altruism is that conduct of the individual which works for the greatest good of the group, which also is the realization of the highest personal aims. The group mind differs from the individual mind in that it is never creative. It is receptive, active, executive, but it must depend on the individual for progressive thought. The single man is powerless, however, without the group to receive his ideas and multiply them. The group is not an organism, but a psychic concept. Comparison of a society to an organism is purely fictitious. There is no birth, growth, decay, and death of a group. A society may live indefinitely if it give the individual the freest opportunity to develop his faculties. The primary factors of progressive variation are: (1) Remembrance; (2) industry; (3) inventiveness; (4) adaptability; (5) receptiveness; (6) forethought. The most startling proposition made by Professor Brinton is that the secret of all improvement is *conscious* effort to improve. "The records of the patent offices are the Sibylline books which will tell the fate of the present great powers in the twentieth century." In marked contrast to Professor Brinton's study in ethnic psychology is *Human Nature and the Social Order*, by Mr. Charles Horton Cooley, of the University of Michigan. "Society and the Individual" is the author's way of expressing the subject of his book. He holds that the individual and society are not distinct or antagonistic entities, but merely different aspects of the same thing. Human life is the essential thing. The same may be said of individualism and socialism as of the words without the *ism*. Every human activity affects both the individual and society. Philosophically there is no difference between individualism and socialism, however convenient they may be to describe theories or programmes of the day.

The question of free will, meaning the power of the individual to choose independently, has no meaning in Mr. Cooley's conception. No distinction can be made between the individual and the social will. Man has the power of choice, but limited by his social environment. The view that society is a composite of individuals is strongly disapproved. "Individuality is neither prior in time nor lower in moral rank than sociality; but the two have always existed side by side as complementary aspects of the same thing, and the line of progress is from a lower to a higher type of both, not from one to the other. If we go back to a time when the state of our remote ancestors was such that we are not willing to call it social, then it must have been equally undeserving to be described as individual or personal; that is to say, they must have been just as inferior to us when viewed separately as when viewed collectively. To question this is to question the vital unity of human life." Mr. Cooley bases his theory of society upon the "personal idea," i.e. the image created in the human mind. He maintains that the real things in both aspects of human life are the mental images formed. "The imaginations which people have of one another are the *solid facts* of society, and to observe and interpret these must be a chief aim of sociology. It follows that a man may be more *real* after death than during his lifetime, and the serf who was regarded as a mere animal had no social reality. There is no such thing as an element of society in the sense that a brick is the element of a wall; this is a mechanical conception quite inapplicable to vital phenomena. I should say that living wholes were aspects, but not elements." The difference between Mr. Cooley and Professor Brinton is not merely a difference in terms. Mr. Cooley denies that either society or the individual is a distinct entity. Both are merely aspects of the same phenomena of human life. Individual psychology and social psychology are not mutually exclusive or antithetical, but each embraces all of the other. They include exactly the same phenomena viewed from different standpoints. Brinton maintains that "ethnic psychology" is a thing distinct and apart from individual psychology, though dependent upon it. "Its laws are those of the group only and are nowise true of the individual; it omits wide tracts of activities which belong to the individual and embraces others in which he has no share."

Among other general works may be mentioned Benjamin Kidd's *Western Civilization*, in which is found the author's new conception of evolution which makes efficiency in the future the controlling factor. Mr. Kidd calls this new principle "projected efficiency." He thinks the type which is successful in the present is not successful because it is best adapted to survive in the present, but because of some "larger advantage probably always far in the future to which the individual and the present alike are subordinate." *Anticipations of the Reaction of Mechanical and Scientific Progress Upon Human Life and Thought*, by H. G. Wells, and *Theology and the Social Consciousness*, by Henry Churchill King, are among the books on general sociology. In the realm of political theory, the work by Professor William A. Dunning, of Columbia, *History of Political Theories*, is of first importance. The volume covers the history of political theories from the early Grecian times down to and including Machiavelli, ground which has never before been adequately covered by the historian of political theory. Professor Dunning strongly emphasizes the intimate connection between political theories and political conditions, showing that theories always trail in the rear of accomplished facts. The author travels a road parallel to that on which the economic materialist journeys along, but he does not attempt to point out any relationship between his own interpretation and that of the economist. The Hellenic democracies are fully examined, showing the institutional basis for Plato's philosophy, and the later theory of Aristotle is shown to have been the outgrowth of an imperialistic development in the State. The predominance of the imperial idea is traced through its various phases in Church and State down to the rise of democracy in the Church during the fourteenth and fifteenth centuries. Professor Dunning does not agree with the usual estimate of Machiavelli, but accords him a permanent place among political thinkers. He holds that political science is indebted to the keen, original mind of Machiavelli for the historical method of attacking problems of politics, and for the establishing of politics as a distinct science. The literature on particular problems and aspects of sociology put forth in 1902 was of course much greater in volume than the more general and theoretical literature. The *Reports of the United States Census* constituted the most voluminous addition to statistical literature both economic and sociological. The *Social Evil*, a report with especial reference to New York City, prepared under the direction of the Committee of Fifteen, by Mr. A. S. Johnson, now of Columbia University, is a most sensible and luminous monograph. It is mostly taken up with a historical study of attempts in different countries in all times to control social vice. The conclusions reached are: (1) All systems of repression have failed and must fail. To attempt eradication of prostitution only serves to aggravate the evil. (2) All systems of police

supervision and license have failed and must fail. French and German methods of inspection, unsatisfactory at home, would be impossible here; and, if practicable, would lead to intolerable moral evil by making immorality safe. The report recommends: (1) Abolition of Raines law hotels and other places of amusement which facilitate the demoralization of young girls; (2) the relief of overcrowded tenement houses and protecting poor families from vicious influences; (3) provision of pure and elevating forms of amusements to draw youth from low dance halls and other debasing places; (4) the public must work to raise the wages of working people, especially of girls who must support themselves; (5) a better system of education is needed; (6) prostitutes should not be treated as criminals, but as unfortunates to be helped, not rigorously driven downward; (7) hospitals for the treatment of venereal diseases should be provided; (8) degenerate youth should be detained in asylums or reformatories; (9) public solicitation must be repressed. *The Care of Destitute, Neglected and Delinquent Children*, by Homer Folks, commissioner of public charities, New York City, is another most careful and useful piece of work. Mr. Folks's long experience in charity organization work enabled him to gain the needed materials for his historical treatise on the methods and practices of caring for poor children in the United States. He makes no attempt to compare American experiences with those of other countries, but the history and criticism of our own practices is excellent. A full and carefully selected bibliography is added. Mr. Folks treats of conditions at the beginning of the nineteenth century; public and private care down to 1875; removal of children from almshouses; the State school and placing out system; the county children's home system; public support in private institutions; boarding out and placing out; laws and societies for the rescue of neglected children; private charities for destitute and neglected children, 1875-1900; delinquent children; present tendencies. *Crime in Its Relations to Social Progress*, by Arthur Cleveland Hall, of New York City, sometime fellow in sociology at Columbia University, is an optimistic study of the evolution of criminal law. "Often, very often, evil is but good out of its proper time and place." The author attempts to demonstrate the "evolutionary function and usefulness of crime and punishment." Other books worthy of note are: *Democracy and Social Ethics*, by Jane Addams, Hull House, Chicago, a study of conditions and means of reform in the slums of Chicago; *Educated Working Women*, by Clara E. Collett, London, showing the need of better and more practicable education of women; *Homeric Society*, by Albert G. Keller, Yale University; *Studies in Political and Social Ethics*, by D. G. Ritchie, of St. Andrews University, Scotland, containing essays on "Social Evolution," "Equality," "Law and Liberty," "War and Peace," and the "Ultimate Value of Social Effort;" also *Americans in Process*, by Robert A. Wood, Boston. Of foreign books may be mentioned *Die Arbeiterschutzesetzgebung in den europäischen Ländern*, by Dr. J. H. van Zanten, of Jena, and *La responsabilité pénale*, by Adolphe Landry.

Many articles of importance appeared in the periodicals during the year 1902. A broad, general survey of the field of sociology is given by Lester F. Ward, of the Smithsonian Institution, in a series of articles running through the January, March, and May numbers of the *American Journal of Sociology*. Brief consideration is given to the different ways of treating the subject of sociology: (1) Sociology as philanthropy, the popular conception; (2) as anthropology, the scientific conception; (3) as biology, the aggressive scientific conception; (4) as political economy, the concept of the "Social Economist;" (5) as philosophy of history, a mere science of history; (6) as the special social sciences, simply a term including economics, history, law, etc.; (7) as the description of social facts; (8) as associations of kind; (9) as the diversion of labor; (10) as imitation; (11) as unconscious social constraint; (12) as the struggle of races. Dr. Ward criticises each of these different concepts of sociology, shows that no one of them is a complete science of sociology, but that none of them is to be rejected. All are legitimate parts of the science, and there are many more of equal importance that have not yet been closely enunciated. It would seem, however, that but two underlying principles accounting for the *origin* of society have thus far been enunciated, viz., (1) Consciousness of kind and (2) economic utility. The former is the particular contribution of Professor Giddings of Columbia University, and the latter has been stated with great clearness by the same author. An article entitled *Recent Tendencies in Sociology*, by Edward A. Ross, professor of sociology in the University of Nebraska, makes a somewhat different analysis and reaches somewhat different conclusions. Beginning with Spencer's organic theory of society, Professor Ross makes five distinct divisions of the various theories of society. The theory of Le Bon may be characterized as the theory of hypnotic suggestion as an explanation of the action of crowds and consequently the association of men. Association on the basis of likeness, as enunciated by Tarde, Gumplowicz, and Giddings, is next treated, and the need of a wider term than "consciousness of

kind" to account for the emotional side of association is asserted. "Our behavior towards others is not determined simply by a perception of resemblances shading off to zero, inspiring a sympathy graduated down to indifference." Force of repulsion as well as force of attraction must be considered. Professor Baldwin brings in a new factor to account for the generation of society, viz., a sense of duty leading up to justice,—a factor which Professor Ross has called "social control." As a rival to the *resemblance* theory is the *community of interests* theory. The one accounts for union of men because of physical and mental resemblances, the other because of like interests, economic, political, etc. In the second part of his paper Professor Ross develops this idea of the great struggle in society. The ultimate tendency is not toward the elimination of struggle. With higher civilization the struggle will become less violent, but men will not cease to compete groupwise as long as there are differences in men. *The Three Primary Laws of Social Evolution*, by Charles W. MacFarlane, of the University of Pennsylvania, appeared in the May number of the *Annals of the American Academy of Political and Social Science*. The author maintains that "survival of the fittest" is not a complete and satisfactory explanation of evolution. We note that men are forced upward, not downward, in the evolutionary process. The higher type is crowded out by the lower type, but in every case is forced up, not down, by the competition with a lower type. Social progress depends upon the existence of a social surplus. The rate of progress depends upon the rate of increase in the social income, which may be: (1) A decreasing rate of increase; (2) an increasing rate of increase; or (3) a constant rate of increase. The last is the most desirable mode, and will be attained under complete integration of industry. Many special articles of importance appeared in the magazines during 1902. One of the most noteworthy is *Poor Relief in the United States*, by E. Münsterberg, of Berlin, running through the January and March numbers of the *American Journal of Sociology*. It gives the estimate of a German expert on American methods of administering poor relief. He concludes: (1) Corruption must be overcome by civil service reform and creation of State boards of supervision; (2) evils of diversion and want of system are noticeable in all American charities. *The New Movement in Charity*, by S. H. Bishop, of the Brooklyn Bureau of Charities; *The Church as the Maker of Conscience*, by Samuel J. Batten, Morristown, N. J., came out in the March number of the same journal; *The Social Will*, by Alfred H. Lloyd, University of Michigan; *The Evolution of Conscience as a Phase of Sociology*, by Walter L. Sheldon, of St. Louis; and *Work and Play in Adjustment to the Social Environment*, by M. V. O'Shea, University of Wisconsin, in the November number must be mentioned. The government of dependencies takes up the whole May number of the *Annals*.

SOMALILAND, the most eastern part of Africa, on the Gulf of Aden and the Indian Ocean, belongs to Great Britain, France, and Italy. A part of the Somali country is incorporated with Abyssinia.

Somali Coast, a British protectorate lying between the French and Italian dependencies and bordering on Abyssinia, has an estimated area of 68,000 square miles. The number of inhabitants is unknown, but has been estimated at about 240,000. The protectorate is administered by a British resident official. Revenue and expenditure for the fiscal year 1901 were Rs. 334,858 and Rs. 389,557, respectively. (The rupee is worth 32.4 cents.) Imports and exports in the fiscal year 1900 were valued at Rs. 6,787,555 and Rs. 5,885,675, respectively; in 1901, Rs. 5,909,353 and Rs. 5,460,322, respectively.

In 1901 Great Britain, assisted by Abyssinia, carried on military operations against insurgent Somalis led by the "Mad Mullah," Hajji Mohammed Ibn Abdallah. The Mullah, a Mohammedan fanatic, with hostile intent against foreigners, had secured a large following, whose depredations upon neighboring tribes were the immediate cause of British interference. After considerable fighting in May and June, 1901, the British troops under Col. J. E. E. Swayne on July 17 defeated the Mullah's forces near Hassan Ughaz and scattered them. It appeared toward the end of 1901, and more clearly in 1902, that this victory was not sufficiently followed up—that the British foreign office was in too great haste to bring the campaign to an end. For in December, 1901, and during the spring of 1902, there was a recrudescence of the Mullah's power. On May 28 a punitive expedition under Colonel Swayne left Burao, about 90 miles from the port of Berbera. A fortified post was made at Bohetleh, about 120 miles further, whence columns were sent against the enemy, but the Mullah fled into the desert Haud country. This region is under Italian protection, but an arrangement was made whereby Italy allowed the British to continue their pursuit within the Italian sphere. Late in July news came of the defeat by a column under Colonel Cobbe of adherents of the Mullah, who were said to have lost 150 men killed and about 4000 camels and

12,000 sheep captured, while another success was reported of Major Phillips. Another victory, resulting in the capture of 1800 camels, occurred on August 18. On September 3 Colonel Swayne's expedition entered the Haud, and about 3000 camels and 10,000 sheep were reported captured. A month later the expedition advanced toward Mudug. It numbered about 2500, comprising about 1500 Somalis, some West African troops, and a few Sikhs, while the Mullah's following was estimated at about 40,000. On October 6 the British force was attacked by the Mullah at Erego. After twice repulsing the enemy and losing two officers killed and two wounded and about 150 men, Colonel Swayne was forced to retreat. The reverse seemed due largely to the unsteadiness of the Somali levies. Although hampered by his wounded and suffering from want of supplies, especially of water, Colonel Swayne reached Bohetleh in safety. The Somali contingent was disbanded. Colonel Swayne, who was British commissioner in the protectorate as well as commander of the expedition, was recalled about November 1, 1902, to act temporarily as adviser to the foreign office in London, and Gen. W. H. Manning (then in London), who was commandant of the Central Africa Regiment, was appointed to the chief command in Somaliland. Reinforcements from the Indian army were ordered. It was feared that the work of pacifying Somaliland had been entirely undone by the defeat at Erego.

Somali Coast and Obock, a protectorate and a colony respectively of France, have an area of about 5000 square miles and a population of about 22,000. The territory is administered by a governor resident at Jiboutil. Additional territory embracing an area of perhaps 40,000 square miles, with some 200,000 inhabitants, is under French influence. The estimated cost of the territory to France in 1901 was 337,500 francs, and in 1902, 200,000 francs (of 19.3 cents each). Foreign commerce in 1901 was valued at 7,335,000 francs for imports and 6,845,000 francs for exports.

The railway building from Jiboutil to Harar (Abyssinia), 186 miles distant, which was practically completed in 1902, has been the source of no little apprehension to the British. At that time the funds of the construction company (the Ethiopian Railway Company) were depleted. In February, however, a convention had been concluded between the protectorate and the company, whereby an annual subsidy of 500,000 francs was guaranteed the company for fifty years; and this was approved by the French government on April 6. The completion of this railway, it was pointed out, would divert the trade of eastern Abyssinia, which was shared by Jiboutil and Zeila (British), to the former, while British political interests would suffer also. Jiboutil already had the advantage of Zeila, since it possesses a large and deep harbor, while the harbor at Zeila is a mere roadstead. To offset the Jiboutil line the construction of a line between Berbera, which unlike Zeila has an ample harbor, and Harar was proposed in 1902. This line, which would probably cost about £500,000, would extend about 60 miles in British territory and the remaining distance in Abyssinian. It was held that aside from the commercial advantage of this line, its political influence, effecting a decrease in administrative expenditure in the British protectorate, would be ample compensation for the interest on the cost of construction. The French hope to extend the Jiboutil line eventually to Adis Ababa.

Italian Somaliland, a protectorate, has an estimated area of 100,000 square miles and an estimated population of 400,000. The inhabitants are engaged largely in pastoral pursuits, but the chief wealth of the country, which is little developed, is the forests of gum and incense-bearing trees. In the fiscal year 1902 imports and exports, stated in Maria Theresa dollars, were 45,011 and 89,052, respectively.

SOUDAN. See FRENCH SOUDAN and EGYPT (paragraph Egyptian Soudan).

SOUTH AUSTRALIA, a state of the Commonwealth of Australia stretching across the entire central portion of the continent from north to south. It has an area, including the Northern Territory, of 903,690 square miles, and its population by the census of 1901 was 362,604, an increase of over 13 per cent. in the preceding decade. The capital, Adelaide, had a population in 1901 of 163,430.

Government and Finance.—The government is administered by a governor appointed by the crown and a cabinet of six responsible heads of departments. The legislature is composed of two houses, a legislative council, whose members are chosen for three years by an electorate possessing a small property qualification, and a legislative assembly elected for the same term by adult suffrage, including women. Primary schools, at which attendance is free and compulsory, are maintained by the state. Their enrollment in 1901 was 69,115. The state revenue and expenditure for the fiscal year 1901 was £2,598,907 and £2,740,805, and for 1902 £2,428,000 and £2,650,000 respectively. The deficit, it was explained, was partly due to the continued drought which had caused a falling off in the railway revenue, which was £115,000 less than the budget estimates. The estimates for 1902-03 placed

the revenue at £2,463,000, and the expenditure at £2,461,800. The state debt on January 1, 1902, amounted to £26,794,835.

Industries, Commerce, etc.—In 1900-01 the total area under cultivation was only 3,279,406 acres. The acreage of the principal crops (1900) was: wheat, 1,743,452 acres; hay, 369,796 acres; oats, barley, and potatoes, 56,045 acres; orchards, 16,000 acres; and vineyards, 20,868 acres. The wheat crop in 1901-02 amounted to 8,012,762 bushels as compared with 11,253,148 bushels in 1900-01, the large decrease being due to the drought. The production of wine reached 1,388,847 gallons in 1900-01. Grazing, one of the most important industries, has suffered incalculably from the drought. The number of sheep decreased from about 5,275,000 in 1900 to 5,000,000 in 1901, and during 1902 the loss was reported to have been even greater. The mineral resources, although probably extensive, with the exception of copper, have been very little developed. The total value of the mineral output in 1900 was £431,289, of which copper comprised £394,446. The value of the imports in 1901 was £7,371,588 as compared with £8,034,552 in 1900. At the same time the exports decreased in value from £8,029,157 in 1900 to £8,015,889 in 1901. The chief exports are wool, wheat, and copper. The length of the state railway lines is 1883 miles, of which 146 miles are in the Northern Territory.

History.—In March, 1902, in accordance with the provisions of the measure passed in 1901 for the reduction of the size of the cabinet, it was reconstituted with four members, Mr. J. G. Jenkins retaining his position as premier and chief secretary. At the general elections, May 3, all the ministers were re-elected and the strength of the parties in the legislature remained about the same, with the exception of the Labor party, which lost three seats. At the opening of the parliament, July 3, Lord Tennyson said that the expected deficit would be met by the issue of new treasury bills. It was further proposed to increase the land-tax, reform the income-tax, and impose additional stamp duties. In October the government bill, providing for the construction of a trans-continental railway (see following paragraph) across the state on a land-grant basis, was passed without opposition, and in November a loan act, authorizing the government to borrow £490,000, was passed. Notwithstanding the continued drought and the large increase in the number of unemployed, there was little labor agitation, that movement having less strength in South Australia than in any of the other Australian states.

The Trans-Continental Railway.—During 1902 the government of South Australia advertised for bids for the construction of a trans-continental railway, which is intended to complete the rail connection between Port Darwin on the north and Adelaide on the south. The road will be entirely within the boundaries of the state of South Australia, which, including the northern region known officially as the Northern Territory of South Australia, stretches across the entire Australian continent from north to south. Already there is in operation in the Northern Territory a line from Port Darwin to Pine Creek, 146 miles to the southward. In South Australia proper there is a railway open from Adelaide to Oodnadatta, 688 miles to the north, and within less than 200 miles of the Northern Territory limits. The proposed line is to fill the gap of 1063 miles remaining between Oodnadatta and Pine Creek. The state proposed to build the road on a land-grant system. Bids will close May 2, 1904, and bidders must state how much land is asked per mile for the construction and the time within which they will complete the work. The conditions imposed provide: (1) that the rails shall be of steel of a weight of not less than 60 pounds to the yard, and the construction on the 3-feet 6-inch gauge; (2) that the work shall be completed in eight years, the minimum of a single year's construction to be 100 miles; (3) that the company shall always maintain a freight and passenger service with trains at least once a week from each terminus; the rates for passenger and freight traffic are not to exceed those on the government lines. The successful bidder is given a right of purchase of the railway from Port Darwin to Pine Creek, at a price to be fixed by arbitration. The state reserves the right to purchase the entire line at any time at a valuation to be fixed by arbitration in case of disagreement. The land-grant, which is to be made in fee-simple and which is to be exempted from state taxation for a ten-year period, is limited to a maximum grant of 75,000 acres per mile of road. At this rate the grant would amount to over 79,000,000 acres of land, an area greater than that of the entire Kingdom of Great Britain and Ireland, and would make the railway corporation the greatest private land-owner in the world. The total cost of construction is estimated at £5,000,000 (\$25,000,000).

SOUTH CAROLINA, a southern Atlantic State of the United States, has an area of 30,570 square miles. South Carolina is one of the original thirteen States. The capital is Columbia. The population in 1900 was 1,340,316, and in June, 1902, as estimated by the government actuary, 1,379,000. The populations of the three

largest cities in 1900 were: Charleston, 55,807; Columbia, 21,108; and Greenville, 11,860.

Finance.—There was a balance in the treasury of South Carolina on January 1, 1902, of \$237,743.25; the receipts during the year were \$3,976,659.51, and the expenditures, \$3,783,605.05, leaving a balance at the end of the year of \$430,797.71. At the end of the year the unfunded debt was \$332,208.64, and the funded debt \$6,514,674.14. The borrowing of money during the year to meet current expenditures was largely due to the fact that the legislature, while appropriating more money than in previous years, had declined to raise the State tax levy of five mills. Another cause of difficulty had arisen from the custom of extending the time during which State taxes might be paid; the extent to which this leniency prevailed being evident from the fact that during the calendar year 1902 more than twice the amount was raised from State taxes lawfully due in 1901 than from those due in 1902. State officials recommended that not only should the State tax levy be raised, but that extension of time should hereafter be denied except in cases of especial emergency.

Agriculture and Industries.—The principal field crops in South Carolina for 1902, as given by the *Crop Reporter*, were: Corn, 1,825,837 acres, 18,988,705 bushels, \$13,102,206; winter wheat, 267,673 acres, 1,498,969 bushels, \$1,528,948; oats, 216,541 acres, 2,836,687 bushels, \$1,673,645; potatoes, 8470 acres, 584,430 bushels, \$561,053; hay, 61,938 acres, 75,564 tons, \$850,095; tobacco, 34,912 acres, 25,625,408 pounds, \$3,331,303.

The director of the mint reported that South Carolina's production of gold amounted in 1902 to \$147,928. The State ranked fifth in the value of granite produced in 1901, the output of all quarries for that year being valued at \$906,084. Production of phosphate fell off from 321,181 tons in 1901 to 285,625 tons in 1902. The cause of the decrease was low prices due to Florida's competition. The most active industry in the State was the manufacture of cotton fabrics. Fifteen new mills, containing 198,664 spindles and 5436 looms—nearly one-fourth the cotton mill construction of the United States—and two new knitting mills were built during 1902. A notable movement in North and South Carolina cotton industry was the buying up of stock formerly owned by northern capitalists by local investors. In Greenville, South Carolina, local investors purchased over \$100,000 worth of stock in local mills within three months.

Legislation.—The regular biennial session of the general assembly of South Carolina convened on January 14 and adjourned February 22, 1902. Among the laws passed were the following: In accordance with a recommendation of the governor, advocating that the existing anti-trust law be made more stringent, a law was passed endeavoring to cover every possible phase of monopoly and to provide for its punishment. A monopoly was declared to be any corporation that attempted to fix or maintain prices, or to fix or limit production, or to sell goods below cost for the purpose of driving out competitors; or if two or more persons or corporations endeavored to control trade by agreeing not to deal with persons outside of their combination, or if such a combination intimidated others in buying or selling, this also was declared a monopoly. A monopoly was expressly declared to be not only a combination of separate companies performing or attempting certain acts, but a corporation or partnership performing or attempting them. If any of these things were done, a fine was to be imposed of from \$2000 to \$5000, and every day during which the monopoly continued to do them was to constitute a separate offense. Companies convicted under this law were to lose their charters if domestic concerns, or, if foreign companies, were to be prohibited from doing business in the State. By another law witnesses were to be compelled to give testimony and to produce books and documents, but they were themselves to be protected from criminal prosecution as a result of their disclosures. Another corporation law provided that all foreign railroad companies doing or desiring to do business in the State should before June, 1902, become incorporated in South Carolina in accordance with the terms of incorporation as laid down in the law of February 22, 1899. Such companies were required to pay the fees demanded by that act, and at least one of the incorporators should be a resident of the State. Without such incorporation it should be unlawful for foreign railway companies to do any further business in South Carolina.

A municipal law of some interest provided that in cities of from 20,000 to 50,000 inhabitants a board of police commissioners might be established by the mayor and aldermen, to consist of five members, of whom the mayor should be one. The board should have full and exclusive control and management of the police force, should elect the chief of police, and might make all necessary police regulations, and have power to appoint and discharge police officers. In cities of from 20,000 to 50,000, also, municipal courts were established by the legislature to have the judicial powers at present vested in the mayor and county magistrates. The

recorder of the court should be chosen by the mayor and aldermen for a term of four years, and an appeal should lie from the recorder to the city council, or to the county court of general sessions. Another law authorized cities and towns to grant exclusive franchises to water and lighting companies, provided that such franchises receive a two-thirds affirmative vote of the aldermen or common council, that the maximum rate to be charged for the water or light furnished be fixed by the franchise, and that no contract or franchise should run for more than thirty years. Municipal corporations were also authorized to create sewerage commissions for the construction or extension of sewerage plants, and to acquire land and property necessary thereto by condemnation proceedings.

Among other acts passed were the following: An act providing for a board of commissioners for the South Carolina Institution for the Education of the Deaf, Dumb and Blind. An act appropriating \$150,000 annually for the payment of Confederate pensions and remedying the defect of the law of 1900 by which such an amount annually was authorized but not appropriated. An act extending the time in which payment of taxes might be made for the fiscal year 1901 to March 31, 1902. Two important recommendations of the governor, one to make elementary school education compulsory, and another to prohibit child labor in the mills of the State, were not acted upon.

Democratic Convention.—The Democratic State convention met at Columbia May 21. The platform demanded the enforcement of present laws against trusts, and the enactment of more stringent measures to compel publicity and prevent stock-watering. Amendments to the tariff laws were recommended, putting the products of the trusts upon the free list in order to take away their monopoly privileges. The convention congratulated Cuba upon her independence, and demanded a policy of liberal commercial reciprocity with the republic. The Philippine policy of the Republican administration was severely condemned.

The Tillman Episode.—On February 22, during a debate on the Philippines in the United States Senate, Senator Tillman asserted that Federal patronage in South Carolina had been parceled out to Senator McLaurin in order to secure his vote for the Treaty of Paris. Senator McLaurin denounced the accusation as a lie, upon which Senator Tillman attacked him, and a fight ensued. The affair caused much excitement throughout the country, and there was much talk of expelling the offending senators. They were censured by the Senate, February 28, and later apologized for their misbehavior. The invitation accorded to Senator Tillman as a member of the naval committee to attend the dinner given by President Roosevelt in honor of Prince Henry of Prussia was cancelled. In retaliation Lieutenant-Governor Tillman of South Carolina sent an insulting communication recalling the invitation of President Roosevelt to present a sword to Major Micah Jenkins, who had served under him in the Spanish war. It was rumored that President Roosevelt's presence at the Charleston exposition would not be agreeable, but the board of directors renewed the invitation. The President accepted and made a speech at the exposition grounds in which he declared that the factional strife between North and South had been completely obliterated, and at the close presented Major Jenkins with a new sword, which had been provided for the occasion.

Elections.—At the regular biennial State election, held November 4, 1902, a full Democratic State ticket was elected. The total vote for governor was: Hayward (Dem.), 31,817; there being no opposition. In accordance with the vote taken at the Democratic primaries, held on August 28, Congressman Asbury C. Latimer (Dem.) is to succeed Senator John L. McLaurin for the full term beginning March 4, 1903. The primaries showed a marked change in the sentiment of the voters by the complete overthrow of the Tillman faction in the State, and the choice of a man representing the "straight out" or "Bourbon" Democrats. The State legislature for 1903 will consist of 41 Democrats in the Senate and 123 Democrats in the House.

State Officers.—For 1902: Governor, M. B. McSweeney; lieutenant-governor, James H. Tillman; secretary of state, M. R. Cooper; comptroller, J. P. Derham; attorney-general, G. D. Bellinger; treasurer, R. H. Jennings; superintendent of education, John J. McMahon—all Democrats. For 1903: Governor, D. C. Hayward, elected for two years, term ending January, 1905; lieutenant-governor, John T. Sloan; secretary of state, J. T. Gantt; comptroller, A. W. Jones; attorney-general, U. X. Gunter, Jr.; treasurer, R. H. Jennings; superintendent of education, O. B. Martin—all Democrats.

Supreme Court for 1902 and 1903: Chief justice, Henry McIver; justices, Y. J. Pope, Eugene B. Gary, Ira B. Jones—all Democrats.

For Congressional representatives, see UNITED STATES (paragraph Congressional Representatives).

SOUTH DAKOTA, a northwestern State of the United States, has an area of 77,650 square miles. The capital is Pierre. The Territory of Dakota was organized

March 2, 1861, and on November 2, 1889, was divided and admitted to the Union as two States, North and South Dakota. The population of South Dakota in 1900 was 401,570, and in June, 1902, as estimated by the government actuary, 414,000. The largest city in 1900 was Sioux Falls, with a population of 10,266.

Finance.—There was held in the treasury of South Dakota at the beginning of the fiscal year ending June 30, 1902, \$764,888.46. The total receipts during the year were \$2,174,257.47, and the disbursements \$2,098,620.53, leaving a balance on June 30, 1902, of \$840,525.40. During the year the bonded indebtedness was reduced by \$185,800, leaving an outstanding bonded indebtedness of \$427,500. At the same time the floating indebtedness of the State amounted to \$250,000, making a total indebtedness of \$667,500. The permanent school fund, invested and uninvested, amounted at the end of the year to \$4,084,566.59. At the same time its unsold lands amounted to 2,570,923 acres, and it was estimated that if sold they would bring some \$31,000,000. As stated by the treasurer of the State, a large amount of personalty and intangible property remained untaxed, while the law of 1895 providing for the assessment of the capital stock and franchises of corporations, was entirely disregarded. It was recommended that the taxation of all these classes of property should receive the attention of the legislature.

Agriculture.—The principal field crops in South Dakota in 1902, according to the *Crop Reporter*, were: Corn, 1,577,398 acres, 29,812,822 bushels, \$12,223,257; spring wheat, 3,604,347 acres, 43,973,033 bushels, \$25,064,629; oats, 692,553 acres, 24,100,844 bushels, \$6,989,245; barley, 305,745 acres, 8,927,754 bushels, \$3,392,547; rye, 36,726 acres, 690,449 bushels, \$283,084; potatoes, 31,801 acres, 2,053,274 bushels, \$1,035,441; hay, 185,719 acres, 228,434 tons, \$948,001; flaxseed, 427,500 acres, 3,200,250 bushels, \$3,655,125.

On account largely of the extraordinary crops, there was a considerable influx of investors and a general rise in land values. The output of the gold mines in the western part of the State increased from \$6,601,800 in 1901 to \$7,398,057 in 1902. Only Colorado and California produced greater amounts. The Homestake mine produced more gold in 1902 than any other mine in the world. From January to October, 1902, its output was 1,218,000 tons of ore, which yielded \$4,303,000. Dividends were reduced from 6 per cent. to 3 per cent., and stock fell considerably during the year. A decrease in the output of silver from \$214,655 in 1901 to \$182,373 in 1902 was reported. The principal development of the year was the erection of a number of plants for the treatment of gold and silver ores by the cyanide process. In the latter part of the year 125,350 tons of gold and silver-bearing ores were treated in the cyanide plants of the State.

Conventions and Platforms.—The Republican State convention was held at Sioux Falls on June 5. The platform indorsed the policy of the President, condemned combinations and trusts, and advocated arbitration of industrial disputes. The action of the Republican national administration in Philippine affairs was praised, the abuse of United States soldiers for alleged acts of cruelty on service was condemned, the attitude of the members of Congress from the State was approved, and the State administration was declared to be satisfactory.

The Democratic and Populist State conventions were held at Huron on June 25. A fusion agreement was reached, to be in effect for one year, the united forces to be known as the Democratic party of South Dakota. The Populists reserved the right to continue as an organization and to act independently of the regular Democrats at any time. The two parties agreed on a State ticket. The Democratic platform reaffirmed the principles of the Kansas City platform, favored government control of railways and public utilities, and the election of United States senators by direct vote. The Fowler currency bill was denounced, also the text book trust in the State. The State legislature was condemned for changing the Australian ballot system.

The People's party, or Populists, in their platform reaffirmed the principles of the Sioux Falls convention of 1900, and declared their confidence in Mr. Bryan's leadership. They denounced the Republicans for their refusal to sympathize with the Boers and for sending representatives of the nation to the coronation of King Edward. A demand was made for the independence of the Philippines and the election of United States senators by direct vote. Trusts were denounced, also the ship subsidy bill, and the Supreme Court of the State was criticised for deciding to nullify the alleged intent of the Constitution regarding the initiative and referendum by allowing candidates' names to appear but once on a ballot.

Elections.—At the regular biennial State election, held November 4, 1902, a full Republican State ticket was elected. The vote for governor was: Herreid (Rep.), 48,196, and Martin (Dem.), 21,396, giving the Republican candidate a plurality of 26,800. The State legislature for 1903 will consist of 42 Republicans and 4 Democrats in the senate, and 75 Republicans and 10 Democrats in the house.

State Officers.—For 1902: Governor, Charles N. Herreid; lieutenant-governor,

George W. Snow; secretary of state, O. C. Berg; treasurer, John Schamber; auditor, James D. Reeves; attorney-general, John L. Pyle; superintendent of public instruction, E. E. Collins; commissioner of schools and public lands, David Eastman—all Republicans. For 1903: Governor, Charles N. Herreid (elected for two years, term ending January, 1905); lieutenant-governor, George W. Snow; secretary of state, O. C. Berg; treasurer, C. B. Collins; auditor, J. F. Holliday; attorney-general, Philo Hall; superintendent of public instruction, George W. Nash; commissioner of schools and public lands, C. J. Bach—all Republicans.

Supreme Court for 1902 and 1903: Chief justice, Dick Haney; associate justices, Dighton Corson and Howard G. Fuller—all Republicans.

For Congressional representatives, see UNITED STATES (paragraph Congressional Representatives).

SOUTH, UNIVERSITY OF THE, an Episcopal institution at Sewanee, Tenn., chartered in 1857 and opened in 1868, includes preparatory, collegiate, theological, law, and medical departments. It had in 1902 a total attendance of 550 students and a faculty of 62 instructors. Its gross income was \$80,000. The library contained 44,000 volumes. The work of transforming Convocation Hall into a library building and its thorough equipment was completed during 1902. Quintard Hall, a three-story building of Sewanee sandstone, was occupied as a dormitory and refectory of the Sewanee grammar school; and much work was accomplished in beautifying the university grounds and approaches by means of landscape gardening.

SPAIN, a constitutional monarchy of southwestern Europe. The capital is Madrid.

Area and Population.—The area of Spain is stated at 197,670 square miles. The population according to the census of December 31, 1900, was 18,618,086 (9,087,821 males and 9,530,265 females), as compared with 18,089,500 in 1897 (8,773,730 males and 9,315,265 females). The legal population was 18,226,040 in 1897 and 18,831,574 in 1900. According to the later census the populations of the largest cities were as follows: Madrid, 539,585; Barcelona, 533,000; Valencia, 213,550; Seville, 148,315; Málaga, 130,109; Murcia, 111,539; Carthage, 99,871; Saragossa, 99,118; Bilbao, 83,306; Grenada, 75,900. There were 63,020 emigrants in 1900 and 56,901 in 1901. The established church is the Roman Catholic, of which almost all the inhabitants are adherents. The constitution forbids the public observance of Protestant forms of worship. A large majority of the inhabitants (68.1 per cent. in 1887) are illiterate, and public instruction continues very inefficient. According to statistics published at the beginning of 1902 there were 25,348 public schools, of which 9,313 were for boys, 7,612 for girls, and 8,423 for children of both sexes. The total number in attendance was 1,617,314. There were private schools to the number of 6,181, with an attendance of 166,880 boys and 177,500 girls.

Government.—The constitution places the chief executive authority with the king, who exercises his power through a cabinet of ministers appointed by himself and responsible to the lower chamber of the Cortes. This body, in which together with the king is vested the legislative power, consists of two chambers, the senate, or upper chamber, and the congress, or lower. Members of the former (not exceeding 360 in number) are partly hereditary and appointive and partly elective; members of the congress (431 in number) are elected by universal manhood suffrage. The regency of Queen Maria Christina ended May 17, 1902, when King Alfonso XIII., on his coming of age, was enthroned. The Liberal ministry of Señor Sagasta was succeeded by the Conservative ministry of Señor Silvela December 6, 1902.

Army and Navy.—All able-bodied Spaniards over nineteen years of age are liable to military service. The peace strength of the regular army in 1901 was stated at 16,274 officers and 110,716 men. In the infantry there were 7319 officers and 45,581 men; cavalry, 1679 and 12,388; artillery, 1260 and 12,834. The military budget for 1902 was 154,506,716 pesetas.

The navy, exclusive of non-effective vessels, is as follows: 1 second-class battleship, 3 first-class armored cruisers, 1 first-class protected cruiser, 9 other cruisers, 20 first-class torpedo boats, 7 second and third-class torpedo boats, 60 gunboats, and 2 coast defense ships. The personnel comprises about 1000 officers, 14,000 sailors, and over 700 mechanics and other employees; there are about 9000 marines. The naval budget for 1902 was 35,941,702 pesetas. In October, 1902, it was stated that a plan for naval expansion would be submitted to the Cortes. This programme included the construction of 10 battleships of 13,000 tons; 6 to 10 cruisers of 3000 tons, 6 torpedo-boat destroyers of 240 tons; 32 torpedo boats of 130 tons, and 40 of 70 tons; 20 gunboats of 300 tons; 2 training ships, and 3 sailing vessels for training purposes. The estimated cost of this construction is upwards of "20 to 24 millions sterling." It is clear that Spain's economic condi-

KING ALFONSO

tion does not warrant such an expenditure, even though it be distributed over a considerable number of years.

Finance.—The monetary standard is bimetallic—gold and silver; the unit of value is the peseta, the face value of which is 19.3 cents, but the actual value about 15 cents. The largest items of revenue are direct taxes and customs; by far the largest expenditure is for the public debt, next in importance being war, public works, etc., and pensions. For 1900 the ordinary revenue and expenditure were 994,818,665 pesetas and 906,063,503 pesetas respectively; 1901 (provisional), 957,243,491 and 930,854,193 respectively. For 1902 the estimated revenue and expenditure in pesetas were 974,437,749 and 971,176,259 respectively, and for 1903, 951,178,227 and 948,661,898 respectively. On July 1, 1901, the public debt amounted to 9,651,503,304 pesetas. In June, 1902, an internal five-per-cent. loan of 338,400,000 pesetas were issued at 90.5.

Industries, Commerce, etc.—Agriculture and mining are the leading industries, while manufacturing is less important. The leading crops include wheat and other cereals, flax, hemp, and fruits, especially grapes. There are valuable mineral deposits, particularly copper, iron, silver, and mercury, and the mining industry is developing. For 1899 the imports and exports are stated at 954,156,701 pesetas and 768,207,934 pesetas respectively; for 1900, 862,396,600 and 723,867,883 respectively. The leading imports include machinery and iron and other metal wares, cotton and woolen textiles, and chemicals, etc. The principal exports in 1900 were: Food-stuffs, including wine, grain, and sugar, 254,735,684 pesetas; minerals, pottery, etc., 159,092,522; metals and metal wares, 88,898,633; animals and animal products, 64,846,347; wood and its manufactures, 53,378,864. Foreign commerce is carried on principally with France and Great Britain. The railways in operation in 1901 had an aggregate length of 13,391 kilometres (8321 miles).

HISTORY.

Politics and Legislation.—The political situation in the early part of 1902 was marked by a cabinet crisis which culminated in the resignation of the ministry on March 13. This ministry had been formed on March 6, 1901, under the premiership of Señor Sagasta, and had pledged itself to carry out certain reforms, including a contraction of the paper currency, a reduction of financial burdens, and especially the subjection to state supervision of the unauthorized religious associations. In pursuance of this pledge a decree drawn by Señor Gonzalez, minister of the interior, had been published on September 19, 1901, ordering all religious associations except those authorized by the Concordat under pain of dissolution to register within six months and declare their statutes, assets, incomes, etc. To the disappointment of the reform party it was announced before the expiration of six months that an agreement concerning the interpretation of the Concordat which authorized the congregations had been entered into with the papacy, as a result of which the decree of September 19 was materially impaired, if not nullified, that is, all congregations asking for authorization were to receive it. At the same time a postponement was granted to the congregations for their registration. This apparent retreat of Señor Sagasta induced Señor Gonzalez to withdraw from the cabinet on March 12. On the same day the finance minister, Señor Urzaiz resigned ostensibly on account of the opposition to his measure for the reconstruction of the Bank of Spain. These two breaks in the cabinet were followed by the resignation of the remaining members on the day following. Sagasta declined to form a coalition ministry as the queen regent wished, but on March 18 reconstructed the cabinet with Liberal members, one of the new appointees being Señor Canalejas, an extreme Liberal, as minister of agriculture, who was induced to take office only after the ministry had promised to undertake the reforms originally announced by the Liberal party. On account of the anti-clerical views of Canalejas it soon became apparent that he would not be supported by the other members of the cabinet on the associations question. A difference between him and his colleagues as to the necessity for an immediate convocation of the Cortes afforded an occasion for his resignation on May 27. He was replaced by Señor Inclan, vice-president of the chamber. The crisis thus terminated was characterized by Sagasta's opponents as a victory of the Holy See over the Spanish government. After the resignation of Canalejas a royal decree was issued upon the advice of Sagasta, suspending the sessions of the Cortes until October. Canalejas thereupon entered upon a propaganda among the people, speaking in many places against clericalism, proclaiming himself a democrat, and advocating, besides anti-clericalism, various political and social reforms, chief of which were decentralization of government, old-age pensions, compulsory life insurance, and employer's liability.

Early in November another cabinet crisis followed, and on the 10th the entire ministry resigned. The Cortes, which were suspended in May, had been reconvened,

and discussion upon the policy of the government had developed opposition from Sagasta's own party, which reproached him for not carrying out the programme he had announced upon taking office. Notwithstanding the opposition to Sagasta the king expressed confidence in him and persuaded him to undertake the reconstruction of the cabinet, which he accomplished on the 14th of November. After vainly endeavoring to form a ministry of concentration he was forced to be content with a "homogeneous" Liberal ministry, essentially the same as that which had resigned. On December 3, Señor Sagasta resigned and announced to the king that the step was irrevocable, as the opposition had treated him with distrust and discourtesy. On December 6 a new cabinet was formed by Señor Silvela, a Conservative, and three days later the Cortes were dissolved to await the spring elections. The new premier announced reforms in the fiscal service, local administration, education, and the army, including compulsory military service. An administrative measure of note was a drastic decree issued by the king on July 1 for the regulation of non-official instruction. The decree provided that all schools of whatever kind which were not state schools, whether founded or supported by corporations or private individuals, should be registered by the proper authorities and subjected to inspection and to certain regulations concerning sanitation, discipline, and qualifications of teachers. The law went into effect September 15, although a further delay of three months was allowed for compliance with its provisions. A statement of the minister of the interior on June 20 showed that there were 3115 religious communities in Spain of which 2611 had applied for and received authorization. A matter of prolonged debate in the Cortes was the question of financial reform. In order to improve the rate of exchange for gold, a bill was passed in February providing for the payment in gold of customs duties on certain articles. In July an arrangement between the treasury and the bank of Spain was concluded, by which all sums advanced to the government by the bank should bear interest at the rate of two per cent. This was to be followed by an increase of the metallic reserve and a reduction of the paper currency.

The Enthronement of the King.—Alfonso XIII. having attained his majority as prescribed by the constitution (16 years) was enthroned May 17, 1902, and the regency held by his mother was thereby terminated. Extensive preparations had been made for the enthronement festivities, and the favorable weather that prevailed at the time made the occasion a notable and brilliant one. At 2 p.m. May 17, the royal family, accompanied by a splendid procession, marched to the chamber of deputies, where in the presence of the senators and deputies the king took the oath to support the constitution. The queen signaled her retirement by a public letter to Señor Sagasta, expressing gratitude to the Spanish people for the proofs of affection and support which she had received from all classes. At the same time the king issued a spirited proclamation to the nation invoking a continuance of the support which had been accorded the queen regent. At night there were splendid illuminations in the cities of Spain, and on the 19th occurred a grand review of the troops at Madrid, 140,000 in number marching past the king. The occasion was marred by the discovery of an anarchist plot against the king and five men with dynamite cartridges in their possession were arrested by the police.

Foreign Relations.—Incidents in the foreign relations of Spain in the year 1902 were the conclusion of arbitration treaties with Argentina, Bolivia, Colombia, Guatemala, Mexico, Paraguay, Santo Domingo, and Uruguay; the conclusion of a treaty of amity, commerce, and navigation with the United States July 3; and the official recognition of the independence of the Republic of Cuba in June. Toward the end of the year rumors were current of an *entente* and possibly an approaching alliance with France, based on the report that France was to extend to the Spanish government aid in constructing a large fleet.

The Industrial Situation.—The industrial situation in the early part of the year was marked by strike riots in several localities, instigated chiefly by anarchists. In January the metal workers at Barcelona entered upon a strike on account of failure to secure favorable concessions from their employers. They were soon joined by other discontented workmen, which swelled the number to 80,000. Riots ensued, and practically all business in the city was suspended. On February 17 the city was declared to be in a state of siege, and martial law was proclaimed. By the end of the month quiet and order had been restored.

SPALDING, JOHN FRANKLIN, Protestant Episcopal bishop of Colorado, died March 9, 1902, at Denver. He was born August 25, 1828, in Belgrade, Me.; graduated at Bowdoin College in 1853, and at the General Theological Seminary in New York City in 1857. He was ordained deacon in Portland in 1857, and priest the following year in Bangor, Me. From 1862 to 1873 he was rector of St. Paul's in Erie, Pa., when he was elected bishop of Colorado. with jurisdiction in

Wyoming. Among other works he published *The Church and Its Apostolic Ministry* (1887); *The Threefold Ministry of the Church of Christ* (1889); and *Jesus Christ, the Proof of Christianity* (1890).

SPOONER, JOHN COIT, senator from Wisconsin, was the author of the isthmian canal bill, which passed both houses of Congress in June, 1902. He was born at Lawrenceburg, Ind., January 6, 1843; removed with his parents to Madison, Wis., in 1859, and graduated at the University of Wisconsin in 1864. In the Civil War he served as private in the Fortieth Wisconsin Infantry and later as captain in the Fiftieth Wisconsin Infantry, being brevetted major at the close of the war. He acted for some time as private and military secretary to Governor Lucius Fairchild, and in 1867 was admitted to the bar. He was assistant attorney-general of the State from 1868 to 1870, removing in the latter year to Hudson, Wis., where he practised law until 1884. During this period his only political office was that of a member of the Wisconsin assembly, 1872-74. He had become prominent, however, as a lawyer and campaign speaker, when, in 1885, he was elected as a Republican to the National Senate. His first term, after which he was succeeded by William F. Vilas in 1891, was uneventful. In 1892 he was defeated for governor, and in 1893 resumed legal practice in Madison. Upon the expiration of Senator Vilas's term, in 1897, Senator Spooner was the unanimous choice of his party, and on January 27, 1897, was formally elected by the State legislature. From the moment of his re-entering the Senate he took a leading part in legislation, and soon came to be recognized as one of the ablest debaters, most sagacious legislators, and hardest workers in the body. He has been a strong supporter of the last two administrations, and his utterance is looked upon as more nearly expressing the views of the administration than that of any other member. At the same time he is conservative and independent, opposed the ship subsidy bill, favors reciprocity and a readjustment of the tariff, and has expressed himself as favorable to the withdrawal of the United States from the Philippines as soon as conditions will permit. See WISCONSIN (paragraph Politics).

SPORTS. See the articles on the various sports.

SPRIGG, Sir JOHN GORDON, premier of Cape Colony since June, 1900, attracted attention by his participation in the conference of colonial premiers in London in 1902, and by his unqualified opposition to the proposal for the temporary suspension of the constitution of Cape Colony. He was born in Ipswich, England, in 1830, and removed to the Cape of Good Hope in 1858. He was elected to the Cape parliament in 1869, soon drew public notice by his energy and ability, and has ever since been prominently identified with the political and commercial development of South Africa. He was premier from 1878 to 1881, from 1886 to 1890, and again in 1898. After the fall of the Schreiner ministry in 1900 he became premier for a fourth time, and his strong and statesmanlike control of affairs in the most trying crisis in the political history of the colony, when a great part of its population was at least tacitly in sympathy with a people at war with the mother country, justifies an estimate that ranks him high among the men who are building up the colonial republics of England in every part of the globe.

SQUIERS, HERBERT GOLDSMITH, who on May 20, 1902, took office as the first United States minister appointed to the newly instituted republic of Cuba, was born in Madoc, Canada, April 20, 1859, and was educated at the Canandaigua (N. Y.) Academy, the Maryland Agricultural College, and at the United States Artillery School. Entering the army as second lieutenant of the First Infantry in 1877, he served as such until 1880, when he was transferred to the Seventh Cavalry. He resigned in 1891, and on November 15, 1894, was made second secretary of the United States embassy in Berlin. In May, 1897, he retired from this post, and in the following January he became secretary of legation at Peking, where, during the Boxer uprising of 1900, he rendered distinguished service on the staff of Sir Claude MacDonald, the British minister to China.

STANFORD UNIVERSITY. See LELAND STANFORD, JUNIOR, UNIVERSITY.

STANLEY, DAVID SLOANE, an American soldier, died in Washington, D. C., March 13, 1902. He was born in Chester, Wayne County, O., June 1, 1828, and in 1852 graduated at the United States Military Academy. He served with distinction in the Civil War, and during the latter part of it was almost constantly in active service, and participated in the battle of Kenesaw Mountain, the assault at Ruff's station, the siege and occupation of Atlanta, the campaigns around Nashville, and the battle of Franklin; and for his gallantry in the latter engagement received the brevet of major-general in the regular army. He was made colonel of the Twenty-second Infantry in July, 1866, and had a wide range of duty at many western forts in controlling Indian outbreaks. From 1883-84 he commanded the district of New Mexico, and from 1884 until his retirement was the successor of

General Rosecrans as commander of the department of Texas. He was president of the Society of the Army of the Cumberland and commander for four years of the National Soldiers' Home in Washington.

STANTON, ELIZABETH CADY, a promoter of the women's rights movement, died October 26, 1902, in New York City. She was born November 12, 1815, at Johnstown, N. Y. At an early age she became imbued with the idea that women were subjected to great disadvantages before the law, and determined to devote herself to the betterment of their condition. When the National American Women's Suffrage Association was formed at Seneca Falls, N. Y., in 1848, she became its first president, and in the same year prevailed upon the State legislature to pass an act giving women the right to retain the title to their own property after marriage. In 1868 she was a candidate for Congress. She was the president of various associations for the promotion of women's rights, and during her whole career was an energetic writer and lecturer. In the publication of *The Women's Bible* she collaborated with several others, in the belief that the King James version degrades women. Her autobiography, *Eighty Years and More*, appeared in 1895.

STATE BANKS. The statistics of State banks, given on the following page, are taken from reports made by the comptroller of the currency approximating to June 30, 1902. In a few places reports were unofficial, and in some others they included both State and private banks.

STEEL. See **IRON AND STEEL** and **UNITED STATES STEEL CORPORATION**.

STEPHENS, WILLIAM RICHARD WOOD, dean of Winchester, died in Winchester, England, December 22, 1902. He was born in Gloucestershire, October 5, 1839, and after private preparation entered Balliol College, Oxford, and graduated with honors in 1862. Ordained in 1864, his first charge was at Staines, where he was made assistant curate in the same year. In 1870 he became vicar of Mid-Lavant, Sussex, remaining there for three years, and he subsequently served the Church in many positions, as lecturer at the Chichester Theological College (1872-75), prebendary of Wittering and theological lecturer at the Chichester Cathedral (1875-94), and rector of Woolbeding, Sussex (1876-94). In 1894 he was nominated to the deanery of Winchester. With the Rev. W. Hunt he edited the *History of the Church of England*, not yet completed, and published *Life and Times of St. John Chrysostom* (1872); *Memorials of the South Saxon See* (1876); *Christianity and Islam* (1877); *Life and Letters of W. F. Hook, D. D.* (1878); *Hildebrand and His Times* (1888); *Helps to the Study of the Prayer-Book* (1891); *Life and Letters of E. A. Freeman* (1895).

STEVENS, BENJAMIN FRANKLIN, an American bibliographer, died in London, England, March 5, 1902. He was born at Barnet, Caledonia County, Vt., February 19, 1833; studied at the University of Vermont, and in 1860 went to London, where he was at first active as a bookseller, and later became manager of the Chiswick Press, United States despatch agent, and purchasing agent for American libraries. For more than thirty years he directed a staff of assistants in the compilation of various manuscripts pertaining to the history of colonial America. Among his important publications, the result of the examination of European archives, is *Fac-similes of Manuscripts Relating to America* (25 vols., 1889-98; 200 copies printed). Other works prepared by him are: *The Campaign in Virginia in 1781* (2 vols., 1888); *General Sir William Howe's Orderly Book*, and *Columbus's Book of Privileges* (with a translation into English).

STOCKTON, FRANCIS RICHARD, an American editor and author, widely known for his unique short-stories, died at Washington, D. C., April 20, 1902. Born at Philadelphia, Pa., April 5, 1834, he was educated at the Philadelphia Central High School, where he graduated in 1852, and began the study of medicine, but turned to wood-engraving, and for several years practised that art. At the same time he contributed to various periodicals prose, verse, and pen-sketches. In 1861 he made further contribution to literature in a pamphlet, *The Northern Voice*, which elaborated a compromise plan to avert the impending struggle. He became a member of the Philadelphia *Morning Post* staff in 1872, and in the same year published in *Scribner's Monthly* (later the *Century Magazine*) the short-story *Stephen Skartridge's Christmas*, which obtained for him the encouragement of Dr. J. G. Holland, then the editor-in-chief. In the same year he established himself in New York City as news-editor of the weekly *Hearth and Home*, of whose humorous department, "That Reminds Me," he also had charge, and for which he wrote numerous short-stories. After a period as assistant editor of *Scribner's*, he was assistant editor of *St. Nicholas* from 1873 until his resignation in 1882. It was his *Rudder Grange*, a humorous story in fresh and distinctive vein, printed serially in *Scrib-*

until Stockton's death, volume after volume of characteristic fiction appeared in quick succession. Among them—to mention but a few of the familiar series—were: *A Jolly Fellowship* (1880); *The Lady or the Tiger?* (1884); *The Casting Away of Mrs. Lecks and Mrs. Alchime* (1886); *The Christmas Wreck* (1886); *The Bee-Man of Orn* (1887); *The Dusanics* (1888); *The Great War Syndicate* (1889); *The Merry Chantor* (1890); *The Rudder Grangers Abroad* (1891); *The Adventures of Captain Horn* (1895); *The Great Stone of Sardis* (1897); and *A Bicycle of Cathay* (1901). The posthumous *John Gayther's Garden, and the Stories Told Therein* (1902) maintains the same excellent standard. *Buccaneers and Pirates of Our Coast* (1898) contains popular sketches regarding a phase of history in which he was deeply interested and made extensive researches. He also published in 1901 the novel *Kate Bonnet*. His reputation rests chiefly on his whimsical short-stories, including such famous titles as *The Lady or the Tiger?* *The Transferred Ghost*, *The Spectral Mortgage*, and *A Tale of Negative Gravity*. In all there is recurrent the peculiar Stocktonian manner, a law unto itself, narrating with preternatural reasonableness the absurdly illogical and the patently impossible.

STODDARD, ELIZABETH DREW [BARSTOW], an American novelist and poet, died August 1, 1902, in New York City. She was born at Mattapoisett, Mass., May 6, 1823, and her education was acquired at a seminary for young ladies. At the age of twenty-eight she married Richard Henry Stoddard, the poet and litterateur, lived for a time in Boston, then removed with him to New York City, where the remainder of her life was spent. She was the mother of the late Lorimer Stoddard, the playwright. In 1860 she contributed to the *Atlantic Monthly*, *My Own Story*, and followed the writing of this short story by three novels drawn from the scenes of her early home, *The Morgesons* (1862); *Two Men* (1865); and *Temple House* (1867). They were entirely different from any novels of the time, but, though immature in structural qualities, showed the author as worthy a pioneer as the Brontë sisters in England, in the temperamental treatment of life in fiction. Standing apart from the literature of the time, which was largely polemical, the novels had but a moderate success, yet they have always been valued by a small circle of admirers, and have twice been reprinted, the last time in 1901. A few short stories and occasional poems, the latter gathered into a volume in 1896, are all that Mrs. Stoddard attempted after her last novel.

STOKES, Sir JOHN, a British soldier, lieutenant-general in the Royal Engineers and senior vice-president of the Suez Canal Company, died November 17, 1902, at Ewell, Surrey. He was born in Cobham, Kent, in 1825, attended the Royal Military Academy, and entered the Royal Engineers in 1843. He took part in the Kaffir wars, was intrusted in 1855 with the formation of the engineer corps for the Anglo-Turkish contingent, and was present at the fall of Sebastopol. For fifteen years he served on the European commission, created by the Treaty of Paris in 1856 to open the mouth of the Danube, which effected the restoration of order and opened the river to navigation for large ships. In 1873 he was a member of the international commission on tonnage and Suez Canal dues at Constantinople. The following year he returned to England to take command of the school of military engineering at Chatham. In 1876 he had the distinction of concluding the convention with M. de Lesseps, whereby the recommendations of the Constantinople commission of three years before were finally accepted by the Suez Canal Company. In 1881 he received a war office appointment as deputy adjutant-general of engineers. He was retired from the army in 1887, but he continued his connection with the Suez Canal Company up to the time of his death. He was created C.B. in 1871, and K.C.B. in 1877.

ST. PIERRE, capital of Martinique, destroyed by eruption of Mont Pelée in May, 1902. See MARTINIQUE.

ST. PIERRE and MIQUELON, the largest of two groups of small islands lying near the south coast of Newfoundland, and constituting a French dependency. The St. Pierre group, which is only 10 square miles in area, has about nine-tenths of the population. The area of the Miquelon group is 83 square miles. The total resident population is only about 6500. The dependency has little importance except as the headquarters of the French codfishing industry on the Grand Banks. In 1900 the imports were valued at 9,326,037 francs and the exports 13,467,453 francs; of the latter 12,253,997 francs represented codfish (including cod-liver oil). On November 1, 1902, the town of St. Pierre was devastated by fire, the estimated property loss being about \$500,000.

STRAITS SETTLEMENTS, a British crown colony on the Straits of Malacca, comprise Malacca and Wellesley at the southern extremity of the Malay Peninsula, the adjacent islands of Singapore, Penang, and the Dingdings, and the Keeling group and Christmas Island in the Indian Ocean. The aggregate estimated area is 1542 square miles and the population (1901) 572,249, of whom 228,555 were in Singapore, the seat of government. The colony is administered by a governor (Sir Frank

Athelstane Swettenham, since 1901), assisted by executive and legislative councils. In 1900 revenue and expenditure amounted to 5,386,557 dollars (Mexican) and 6,030,744 dollars respectively; in 1901, 7,041,686 and 7,315,001 respectively. Singapore is one of the most important shipping centres in the world and three-fifths of the whole trade of the colony pass through its port. The chief products of the colony are tin, gutta-percha, gambier, pepper, rubber, horns, hides, sugar, sago, tapioca, spices, dye-stuffs, coffee, and gums. The trade returns for 1900 showed imports of 314,089,860 dollars and exports of 262,617,345 dollars; of the latter amount 60,767,602 dollars represented tin, 19,135,903 dollars gums, and 14,526,785 dollars spices. The aggregate trade of all the settlements in 1901 amounted to 599,274,014 dollars, of which tin exports represented the sum of 62,323,051 dollars. The clearances of 8722 foreign vessels during 1900 represented a tonnage of 7,231,220, and of 17,086 native craft, 724,189. Railways, of which 23 miles were open for traffic in 1901, are being rapidly extended and several lines of electric tramways are projected.

STRAUS, OSCAR SOLOMON, an American diplomat, was appointed January 14, 1902, a member of the Permanent Court of Arbitration at The Hague, to fill the vacancy caused by the death of ex-President Harrison in 1901. Mr. Straus was born December 23, 1850, at Otterberg, Rhenish Bavaria, and came to the United States in 1854. He graduated from Columbia University in 1871, and from the Columbia Law School in 1873. He has been a lifelong Democrat, and in 1887 was appointed minister to Turkey by President Cleveland, and distinguished himself to such an extent that he was appointed by President McKinley to the same office in 1898. Mr. Straus is also a member of the industrial commission of the National Civic Federation, which in 1902 made vain efforts to prevent the anthracite coal strike. He has published *The Origin of the Republican Form of Government in the United States* (1886); *Roger Williams, the Pioneer of Religious Liberty* (1894); *The Development of Religious Liberty in the United States* (1896); and *Reform in the Consular Service* (1897). In addition to the activities already mentioned, he is prominent in Jewish reform movements and is a leader in the cause of social betterment of every character. He holds the degree of L.H.D. from Brown University and LL.D. from Washington and Lee University and the University of Pennsylvania.

The aggregate number of laborers involved in trade disputes in the United States in the twenty years, 1881 to 1900, was 6,610,001. Five States, Illinois, Massachusetts, New York, Ohio, and Pennsylvania, containing about 45 per cent. of all the manufacturing establishments and 55.2 per cent. of the capital invested in these industries, had 74.8 per cent. of the strikes and 84.8 per cent. of the lockouts. Mining, including gas and coke-making, was most disturbed by strikes and lockouts, nearly

one-third of the strikers belonging to that trade. The clothing trade ranked next, and then the building trades. Mining also took first place in the severity of the struggles, the average number of days' duration per strike being 48.9, as against 32.8 in the building trades. In the case of strikes, 46.7 per cent. arose from a demand for increased wages; with lockouts, 46 per cent. were caused by refusal to recognize the union. Taking the average of twenty years (1881-1900) the results of strikes and lockouts were as follows:

	Strikes (Percentage of Laborers Affected).	Lockouts (Percentage of Establishments Involved).
Wholly favorable to employees.	35.0	42.3
Wholly favorable to employers..	48.2	50.1
Compromised.....	16.7	6.2

No reliable figures for 1901 and 1902 have been prepared. The mere number of strikes is of no significance; the number of men affected and the length of the strike are the important factors. On this basis there can be no doubt that 1902 has been the most disastrous strike year, at least since 1893. The great strike in the anthracite coal fields was in itself sufficient to make it a record-breaking year.

The Anthracite Coal Strike.—The fundamental factors in the anthracite situation were and are: (1) Monopolization of a prime necessity; (2) gross overcapitalization of resources; (3) redundancy of labor. Given these three elements, all things are possible in the way of industrial upheaval and public inconvenience. Other subsidiary causes operated to aggravate and complicate the situation in the anthracite regions, as, for example, the character of the population, the prevalence of the "truck system," and the peculiar methods of bookkeeping employed by the operating companies. The monopolization of the anthracite coal mining industry is practically complete. Though there are said to be about seventy-four different operators in the field, yet they must ship over the coal roads, and so are at the mercy of the railroad combination at the head of which is J. Pierpont Morgan. The following scheme gives the financial connections of the roads tapping the anthracite coal regions.

<p>"Coal Trust" roads, so called. Roads apparently acting together in the coal traffic under the general advice of J. F. Morgan & Co., and bound together by financial ties of widely varying strength. The predominant holdings are by Morgan, Pennsylvania, and Vanderbilt interests.</p>	<p>Pennsylvania R. R. —Fenn. control.</p>	<p>Philadelphia & Reading R. R. —Morgan control.</p>	<p>Central R. R. of New Jersey. —Morgan control. Sold to the Reading in January, 1901.</p>
	<p>Delaware, Lackawanna & Western R. R. —Vanderbilt control.</p>	<p>Sold jointly to Baltimore & Ohio R. R., representing Pennsylvania, and to the Lake Shore R. R., representing Vanderbilt interests.</p>	
	<p>Erie R. R. —Morgan control, considerable Vanderbilt interests.</p>	<p>New York, Susquehanna & Western R. R. Bought by Erie and later mortgaged to Morgan syndicate.</p>

	<p>Delaware, Susquehanna & Schuylkill R. R. Owned by Coxie Bros. & Co., independent operators.</p>		
<p>Independent or partly independent roads.</p>			<p>Their position "is one of relative independence."—Editor <i>Railway World</i>.</p>

The laws of Pennsylvania forbid a common carrier to own coal lands or to engage in the mining of coal. To get around this difficulty the roads have organized subsidiary companies to hold their coal lands and carry on actual mining operations under a different corporate name but under the identical management. This arrangement has resulted in a wonderful system of accounting whereby the profits, of right accruing to the coal mining departments, are paid over to the carrying departments in the shape of exorbitant freights. Several of the roads are grossly overcapitalized, as will be seen from the table given below.

The oversupply of labor is attested by low wages, long hours, bad conditions of housing, high cost of living, long periods of idleness, and the general squalor of the mining population. Daily or monthly wage rates are useless for comparison, because the mines are never operated more than 200 days in the year, nearly always much less, so that while wages appear good, the yearly earnings are very small. Such conditions are fruitful of discontent, and the miners struck for an advance of 10 per cent. in 1900, which was thought to have been granted for political reasons rather than as a concession to the miners' union. Neither party was satisfied, and though the agreement was renewed till April, 1902, both awaited its expiration with the determination of forcing the other to yield concessions.

†Only the Pennsylvania lines east of Pittsburgh are included.

‡The Reading Company proper, for which the figures are here given, is primarily a mining and land owning company; it owns, however, the Philadelphia & Reading Railroad, and the finances of the two are inextricably intertwined.

In April, 1902, the disaffected miners formulated a demand for an eight-hour day, 60 cents a ton (2240 pounds) for mining coal, and recognition of the miners' union, all of which were promptly refused by the companies. The National Civic Federation then attempted to effect a settlement, and did succeed in bringing about a conference, which, however, merely served to widen the breach. Officers of the United Mine Workers met at Scranton, Pa., May 7, and President John Mitchell issued the union ultimatum, which was rejected with emphasis by the operators next day. Mr. J. P. Morgan had sailed for Europe a short time before while the first trouble was brewing. Senator Hanna, as chairman of the industrial committee of the National Civic Federation, called upon him to use his influence to bring about an adjustment, but Mr. Morgan declined to intervene, and laid the whole responsibility upon the operators. On May 9 President Mitchell ordered a temporary strike, pending the action of the convention of union delegates representing the disaffected districts. By May 12, 145,000 men were idle, and not a pound of coal was mined in the anthracite region. Senator Hanna made a last attempt to bring about a settlement, asking for a truce of sixty days in order that the winter's supply of coal might be mined, and time be allowed for a permanent adjustment, but his good offices were refused by both sides. On May 14 the convention of the United Mine Workers met at Shamokin, Pa., and the next day decided by a vote of 456 to 344 to continue the temporary strike. This is the official beginning of the strike in the union calendar, though work had been interrupted since May 10, and practically stopped on May 12. President Mitchell directed the strike from his headquarters at Wilkesbarre, Pa. On May 20 the coal road presidents met in New York City and determined to grant no concessions whatever. The executive committee of the union met the following day and decided to allow the pumpmen to work in order to keep the mines clear of water until June 2. At the same meeting plans were made for calling a convention representing all United Mine Workers' unions to consider the question of a general strike in the bituminous mines for the purpose of forcing the anthracite "coal barons" to terms. The operators refused to yield even when threatened with the flooding of the mines, and the annihilation of industry by the suspension of practically all coal mining in the country. When June 2 came, 80 per cent. of the pumpmen went out, and the water began to flood the mines. In the meantime the company stores had refused to give credit to miners, and hunger and suffering began to be felt among the poorer families. Thousands of miners, mostly the young unmarried Americans, left the region, thus aiding somewhat in relieving the permanent condition of congestion which had been a fruitful cause of all the labor troubles in the anthracite mines. President Roosevelt at this point attempted to bring about a settlement by arbitration, but the operators had "nothing to arbitrate." After consultation with Senator Hanna and Commissioner of Labor Wright, President Roosevelt deputed the latter to make an investigation and report upon the conditions in the strike area. Although Commissioner Wright did not have access to as much information as could be desired, yet his report, made in June, presented some aspects not well understood before and enabled President Roosevelt to deal more intelligently with the problem in his subsequent conferences with the "coal barons."

It now became evident that the struggle was a fight to the death, and, as usual,

the strikers resorted to violence to frighten away "scabs" and to inflict damage upon the property of the companies. By June 4, 5000 special police were on duty in the coal fields, but as usual in such emergencies the police merely furnished a further incentive and objective point for more violence. When new men came into the mines, it was impossible to prevent outbreaks. The first bloodshed occurred June 7 when a tank boss was shot and killed by strikers at Keystone, W. Va. The first serious rioting occurred on July 30 at Shenandoah, Pa., when several policemen and more than forty strikers were killed or wounded. Governor Stone immediately sent two regiments of militia to the scene and order was restored. Violence became more frequent as the strike continued. Dwellings, bridges, and even trains were dynamited, and collieries were attacked with intent to destroy.

At first the cause of the miners was regarded with disfavor by the public generally, and if the operators had shown more capacity for candid dealing and regard for public interests they would have won an easy victory. It has been said in explanation of the persistent offers to arbitrate on the part of Mr. Mitchell, and the persistent and aggressive refusal on the part of the operators, that the miners had everything to gain and nothing to lose by arbitration, while the operators had everything to lose and nothing to gain. This is far from the truth, for an adverse decision by an arbitration tribunal would have meant practically the annihilation of the miners' union.

On June 11 the operators published the correspondence between themselves and Mr. Mitchell with reference to the miners' demands. Among other things George F. Baer, president of the Reading road, declared that the efficiency of miners had decreased 1,000,000 tons because the contract miners had worked only $4\frac{1}{2}$ to 6 hours a day. The number of tons per man had decreased 11 to 17 per cent., or about $12\frac{1}{2}$ per cent. on an average. Each one of the coal road presidents declared that to raise wages was utterly impossible, and to arbitrate would be to admit the public into the management of their business.

In a statement issued June 22, President Mitchell reviewed the situation and stated the demands of the miners. After stating that every possible means had been used to avoid the strike, he said that the average annual earnings of coal miners were less than those of any other class of workmen in the United States, notwithstanding that their work is the most hazardous. They are employed never exceeding 200 days in one year, and receive on an average \$1.42 for ten hours' work, or considerably less than \$300 a year. In regard to the operators' statement that the efficiency of miners had declined during 1901, Mr. Mitchell quoted the figures of the United States Geological Survey to show that the average time worked each year from 1890 to 1900 was 186 days and the production of coal per employee was 363.58 tons a year, or 2.16 tons a day; for 1901 the mines were open $194\frac{1}{4}$ days, and the amount produced was 475.43 tons a year, or 2.36 tons a day for each employee. Mr. Mitchell, however, did not take into account the extraction of coal by the washeries. It is probable that the amount of coal produced by contract miners did decline. In answer to the statement of President Olyphant, of the Delaware and Hudson Company, that the cost of mining had increased 13 cents for 1901, Mr. Mitchell quoted the official figures showing that during this same year the price of coal had advanced 39 cents a ton.

The convention of the United Mine Workers met at Indianapolis July 16. It was generally understood that it would vote as President Mitchell advised. He advised against a strike in the bituminous areas, urging the necessity for the miners to keep their contracts with the operators, and pointing out the appalling results to industry of a discontinuance of work in the bituminous mines. On the 19th of July the convention voted to stand by their agreements as President Mitchell advised. At the same session it was decided to support the anthracite strikers with funds, and orders were issued calling for assessments from coal miners at work everywhere. See ALABAMA.

On October 3 President Roosevelt called the presidents of the coal roads and Mr. Mitchell to meet him in Washington. At that time Mr. Mitchell proposed that the miners begin work at once on the promise that an arbitration commission be appointed by President Roosevelt to adjudicate all differences. This proposition the operators unanimously rejected. All confidently asserted that the only obstacle in the way of mining coal was lack of protection to the non-union miners, and demanded that President Roosevelt call out the federal troops to put down the strike as an interference with interstate commerce. President Baer asserted that 15,000 or 20,000 men were at work in the mines and that they were "abused, assaulted, injured, and maltreated by the United Mine Workers." After declaring that the operators were ready and able to mine coal if proper protection were afforded them, President Baer continued: "The government is a contemptible failure if it can only protect the lives and property and secure the comfort of the people by compromising with the violators of law and

the instigators of violence and crime. Just now it is more important to teach ignorant men dwelling among us, misled and used as tools by citizens of other States, that at whatever cost and inconvenience to the public, Pennsylvania will use the whole power of government to protect not only the man who wants to work, but his wife and children while he is at work, and to punish every man who by instigation or by overt acts attempts to deprive any man of his liberty to work. Under these conditions we decline to accept Mr. Mitchell's considerate offer to let us work on terms he names." The others followed out the same line. Mr. W. H. Truesdale went a step further and demanded that the miners' union be proceeded against in the courts as an organization in restraint of trade. Governor Stone of Pennsylvania ordered out the rest of the State national guard, but the protection of the 10,000 militia and 600 special police could not induce outside laborers to come in, while the men of the region stood together as a unit and refused to return to work.

On October 10 Senators Platt, Quay and Penrose and Governor Odell conferred with Mr. Baer and Mr. Thomas to propose a plan of conciliation. In refusing this offer, Mr. Baer said: "We will not accept political advice or allow the interference of politicians in this, our affair." Thereupon Governor Odell replied: "I want you and all the other operators to understand that I am the governor of New York, the chosen representative of 7,000,000 people, and I am here in this matter solely in that capacity and to relieve if possible an intolerable situation. And what is more, I intend to use every power at my command to do it." The governor continued his answer in the form of proceedings by the attorney-general of the State to ascertain if the coal trust was in violation of the anti-trust laws of New York.

On October 13 President Roosevelt had a conference with Mr. J. P. Morgan at which the latter proposed to refer the matter to a commission of five members consisting of (1) an officer of the engineer corps of the army or navy; (2) an expert mining engineer, with experience in mining coal and other minerals, but not connected in any way with coal mining; (3) a judge of the United States Court for the eastern district of Pennsylvania; (4) a man acquainted with the business of mining and selling coal as an operator; and (5) a prominent sociologist. The labor leaders objected to this commission on the ground that no representation was given to labor. President Roosevelt induced the operators to accept a sixth member, naming Bishop Spaulding as the man, and succeeded in overcoming Mr. Mitchell's objections by appointing as "a prominent sociologist," Mr. Edward E. Clark, of Cedar Rapids, Ia., president of the Association of Railroad Conductors. The other members appointed were Gen. John M. Wilson, engineer of the United States army; Mr. Thomas H. Watkins, of Scranton, coal operator; Judge George Gray, of Delaware; and Mr. Edward W. Parker, of New York, mining expert. The evidence taken by the commission up to the end of 1902, brought out many pathetic and distressing circumstances. The evidence showed that oftentimes severe want prevailed in the mining regions, while the conduct of the operators was often marked by extreme cruelty. Abuses were shown upon both sides. It was proven that little girls worked twelve hours in the silk mills in the mining region for 66 cents. The following day the operators introduced their pay rolls showing that the fathers of two of these girls received for the year 1901, \$1400 and \$1681 respectively, and that after deducting one-third for their laborers they still had left \$933 and \$1121 respectively. This evidence produced strong feeling against the greed of the miners; but later the New York *Evening Post* found these men and put them on the stand. It was proven by them that the money credited to them on the company's statement was not their earnings alone, but was in each case the earnings of a double gang which, during part of the year, numbered six men. The general superintendent of the company was put on the stand, and acknowledged that such double gangs were sometimes entered on their books as single gangs, and that he had given the earnings of these men to the commission, and the press without any intimation that they were the earnings of a group. Judge Gray, chairman, gravely warned the representatives of the company that this disclosure called in question all their statements of earnings. On the other hand it was shown that the union not only practiced intimidation and boycotting against non-union men during the strike, but had been guilty of the most outrageous attacks upon non-union operatives. At the close of the year the evidence as to conditions in the mines was practically all in, and it seemed inevitable that the miners would win some at least of the concessions that they demanded.

Other Strikes.—Numerous lesser strikes occurred all over the country, some of them involving large numbers of men and great capital. In May and June the packing-house teamsters of Chicago carried on a strike for an advance in wages. On June 5 they returned to work, their demands being satisfied. On July 7 9000 freight handlers employed in railway warehouses in Chicago struck for an increase

in wages, extra pay for overtime, and the recognition of their union. Truckmen and icemen struck in sympathy on the 14th. For two days all traffic was blocked, not even perishable freight being handled. On the 16th the strikers went back, having secured an advance in wages, but no recognition for the union. It is estimated that the strike cost the city of Chicago \$12,000,000, owing to the loss of fruit and other perishable articles. Many annoying strikes in the building trades occurred not only in Chicago, but in all the large cities where these trades are thoroughly organized. The carpenters' national organization reported more than 500 strikes during 1902, every one of which was successful. The building trades are the most completely organized of any branch of labor and have the public at their mercy. No contractor dares to employ non-union labor in construction. Even the hod carriers can dictate their own terms in some cities. Contractors are compelled to exercise the greatest care to avoid building materials made or handled by non-union labor. Many costly and annoying strikes have occurred on the most trivial pretexts, as the fact that a non-union teamster was handling brick, or that the lath being used was made by a non-union mill, or that the floor joists were handled by "scab" workmen. When it has been discovered that material contaminated by the touch of non-union labor has been used in a building, all further progress is stopped until the material is ripped out and destroyed or carted away (by union labor) even at the peril of destroying the whole structure. As good an illustration as any, is the City Hall in New York City, which was being repaired when a walking delegate discovered something non-union. The repairing was stopped immediately, causing a long and costly delay; the contractor had to give up the job; a new man took charge and all the work previously done was undone and the materials carted away. Examples could be cited even more flagrantly tyrannical, as where contracts for repairs have been suddenly thrown up on some pretext, leaving an inhabited house without a foot of serviceable plumbing for months. The trade unions have grown in numbers, but, with the public in general, there can be no doubt that the unions have lost favor during the past year because of their despotic and violent methods.

A strike of the Virginia miners in sympathy with the anthracite strikers for recognition of the union, an eight-hour day, payment of wages by the week, and certain concessions relating to mining, occurred in June. It was soon compromised and no great losses resulted. A curious strike occurred in Birmingham because the Tennessee Coal, Iron and Railroad Company refused to collect a dollar from each of its employees to be turned over to the union for the assistance of anthracite strikers. The union was unable to collect its assessments, and tried to force the company to act as its collector. The company refused to deduct the amount from the wages of any man without his consent, whereupon the executive board of the Alabama miners expelled the recalcitrant miners and authorized a strike whereas a majority of the miners voted for the contribution. Much unfavorable comment was aroused by this high-handed action and the unions did not attempt to push the matter. The street railway employees of New Orleans struck on September 28 for an eight-hour day and 25 cents an hour instead of a ten-hour day and 17½ cents an hour. Serious interference with business led the governor of Louisiana and the mayor of New Orleans to request arbitration of the points in dispute. On October 10 the company accepted the proposal to pay 20 cents an hour for a ten-hour day, and guaranteed a minimum wage of \$1.50 a day. The strikers at first rejected, but afterwards accepted the terms, and the strike ended October 13. During October the motormen on the Hudson Valley Railway at Glens Falls, N. Y., went on strike, demanding the recognition of their union and an advance in wages. Violence being used by the strikers when the company attempted to run its cars with non-union employees, the State militia was called out to quell the disturbances. On October 8 the Schenectady Trades Assembly, having over 12,000 members, voted unanimously to recommend the expulsion from local unions of all members of the National Guard. The Painters and Decorators' Union of Schenectady, N. Y., soon after expelled one of its members because he belonged to the National Guard, and, at their demand, his employers discharged the man, though they recommended him as a good mechanic, willing to work for his employer's interests. The law explicitly states that any conspiracy to interfere in any way with a man exercising a lawful trade is a misdemeanor. The attorney-general, however, decided that the officers of the union could not be prosecuted for compelling his employers to discharge a man because he belonged to the militia, for they had not in terms demanded his discharge but only notified his employers that he was no longer a member of the Painters and Decorators' Union. The same union boycotted the Schenectady Railroad Company for employing non-union labor in the erection of a car barn. Behind this was an attempt on the part of the Trades Assembly to force the street railway employees into the federation of trades against their will. The boycott was an utter failure, but it led to the formation of a citizens' union to mediate between capital and labor. The strike on the Hudson Valley Road was

not in itself important, but the many important questions growing out of it, relating to the powers and immunities of trade unions, make it second only to the great coal strike in interest and significance. Sixteen States of the Union have central boards of arbitration, viz.: Massachusetts, New York, California, Colorado, Idaho, Illinois, Louisiana, Montana, Minnesota, Ohio, Utah, Wisconsin, New Jersey, Michigan, Connecticut, and Indiana. The boards usually consist of three members—an employer, an employee, and a neutral. The sixteenth annual report of the Massachusetts State Board of Arbitration and Conciliation for the year 1901 states that during that year the board mediated 108 cases involving 95 strikes. Official action was taken in 37 cases on joint petition, in 27 cases on notice from one party, and in 44 cases the board took the initiative.

Some Foreign Strikes.—The strike of many federated trade unions in Havana assumed grave proportions and threatened the very existence of the Republic of Cuba for a time. The violence was precipitated by the refusal of the street car employees to join the strike, whereupon the cars were attacked and a boycott was attempted. Owing to the patriotic attitude of General Gomez, the strike was prevented from becoming a rebellion, and perhaps a revolution. The city and national authorities acted promptly and the disturbance was soon quelled. The number of labor disputes in England was less in 1902, but the number of people affected was more than in any of the years 1896-1901. The total number of days' work lost, however, was less than in 1901.

YEAR.	Number of Disputes.	Work People Affected.	Total Number of Days' Idleness.
1901	642	179,546	4,142,287
1902	427	254,930	3,477,962

In Belgium, the Conciliation Law has worked no better than in France. In June, 1902, there were in existence 75 councils of industry and labor, for settling labor disputes. During the year 1901 but six disputes were referred to the councils, and in only one case was mediation successful.

See AUSTRIA-HUNGARY, FRANCE, and SPAIN.

Labor conditions were closely connected with the political movements, and the general strike of laborers was more a political than an industrial event. (See SOCIALISM.) In Austria, many serious strikes occurred in consequence of the depression in industry. One of the most serious was the strike of the firemen of the Austrian Lloyd Steam Navigation Company at Trieste in February. Many sympathetic strikes followed and a general stoppage of industry accompanied by mob violence resulted. The depression in the metal trades was especially severe, causing unusually heavy emigration to America.

The manufacturers of Vienna have formed a Manufacturers' Strike Insurance Company, in order to protect themselves from losses due to strikes. Statistics from 1891 to 1897, give for Austria an annual average of 30,000 laborers on strike and 400,000 days of idleness on that account. On this basis the premiums of members are fixed at four-tenths of one per cent. of the declared pay list for the year. A rebate of 25 per cent. is given in some cases where the risk is slight. The Austrian company agrees to pay one-half of the registered wages of the strikers to the employer; but payments are made for no more than three months in case of a single strike, or six months in a single year. The indemnity is paid only in case the insurance company judges the strike to be unjustifiable. A demand by the laborers for the dismissal or engagement of any employee is regarded as unjust. So are also demands "which the state of business will not justify" and "demands which threaten the authority of the management." The first test is clear and unequivocal, but the last two are the points of disagreement in every strike. An executive committee investigates each strike as soon as it begins, and decides whether the employer is entitled to indemnity. Employers are obliged to give full information of every dispute as soon as it arises. The executive committee immediately sends a sub-committee to attempt a peaceful settlement. When they finally order the strike indemnity to be paid, it means that in their judgment the strikers are in the wrong, and that they have exhausted every means of conciliation. It is too soon to judge of the success of this latest scheme to solve the strike problem. This simple business project seems to possess about all the real advantages and none of the very serious disadvantages of compulsory arbitration boards. The manufacturers of Leipzig, Germany, are forming a similar organization. Labor disturbances were frequent in Spain also. The great strike at Barcelona threatened for a time to become a revolution. All industrial and trading associations joined in demanding a nine-hour day, with increased wages. The strikers took possession of the streets; rioting and violence occurred, and the city was put under martial law for some days. The strikers finally resumed work at the end of February without gaining their

point. Serious strikes, with rioting, occurred later in the year at Malaga and in the iron-smelting regions.

STYPTICIN. A new local hæmostatic devised by Prof. M. Freund, having the formula $C_{12}H_{14}NO_2Cl$. It has been used with success in cases of wounded mucous membrane after passage of bougies, the endoscope, etc., for arresting hemorrhage following extraction of teeth, removal of small dermoid tumors (as warts and condylomata), and to stop the bleeding of hemorrhagic ulcers. It is more easily applied to the urethra when combined with gelatine and made into suppositories. Stypticin is a synthetic compound and is a muriate of cotarnine.

SUEZ CANAL, a waterway connecting the Mediterranean and Red seas, 87 miles in length, comprising 66 miles of artificial canal and 2 miles of lakes. In 1900 transit dues amounted to 90,623,608 francs and, in 1901, 100,386,397 francs (larger than in any previous year). There passed through the canal, in 1900, 3441 vessels, aggregating 9,138,152 tons, and, in 1901, 3699 vessels aggregating 10,823,840 tons. In the two years British tonnage amounted to 5,605,421 tons and 6,252,819 respectively, and German 1,466,391 and 1,762,624 respectively. A regulation to take effect January 15, 1903, diminishes the transit rate by 50 centimes (9.65 cents) a ton. On February 15, 1902, an agreement between the canal company and the Egyptian government was signed for the construction of a railway between Ismailia and Port Said, and for a commercial harbor at the port.

SUGAR INDUSTRY. There were two leading topics of interest in the sugar industry during 1902. One was the Brussels conference, at which representatives of European governments negotiated a treaty containing provisions designed to eliminate some of the artificial conditions which have clustered around this business in Europe. The other, which was of as vital concern to the United States, was the negotiation of a reciprocity treaty with Cuba by which the product from that country secured preferential treatment by admission into the United States at a reduction of 20 per cent. in duty. This treaty, however, failed of ratification during the year, so that its effect was not felt in the markets of the United States. (See CUBA.) The regulations of the Brussels Conference do not go into effect until September, 1903, so that the results of this settlement did not largely affect conditions during the year, although naturally, to some extent, anticipated and discounted. The conference was the outcome of an agitation that has been carried on in Europe for a number of years. As a result of bounties, direct and indirect, and other forms of artificial stimulation the manufacturing of beet sugar had been carried on with great profit to the manufacturers and the business had become centred in trusts or syndicates usually known as *cartels*. The result was that sugar was sold for export at much lower prices than to the domestic consumers inasmuch as there was a bounty or rebate on all sugar exported. This stimulated export of sugar naturally disturbed business conditions in other nations. Inasmuch as these abuses prevailed among nearly all European nations it was determined to do away with them through an international agreement. Accordingly a conference to pass on this matter was proposed, and the first meeting of the delegates was held at Brussels on December 16, 1901. After an interchange of views the delegates returned to their respective countries for final instructions from their governments, and in February, 1902, the sessions of the conference were resumed, with the result that on March 5, a treaty was signed by delegates representing the German Empire, Austria-Hungary, Belgium, Spain, France, Great Britain, Italy, Holland, and Sweden and Norway. In this treaty the contracting parties bound themselves to suppress the existing direct and indirect bounties, and agreed not to establish such bounties during the duration of the convention. Sweetmeats, chocolates, biscuits, condensed milk, and other analogous products containing a large part of sugar are classed as sugar, and come under the regulations prescribed by the treaty. The different forms of bounties are enumerated as follows: Direct bounties granted to exports; indirect bounties granted to production; total or partial exemption from taxation granted for a part of the manufactured output; profits derived from surplusage of output; profits derived from the exaggeration of the drawback; advantages derived from any surtax in excess of that fixed by the treaty. It was provided that all factories where sugar was manufactured should at all times be under the surveillance of revenue officers. The surtax was limited to a maximum of six francs per 100 kilograms for refined sugar and sugars assimilable thereto, and five and a half francs for other sugars. A special duty not less than the bounty granted was to be levied on imports of sugar from nations which grant bounties on production or exports. The contracting parties also agreed to admit at the lowest rates possible sugars imported from countries parties to the convention or their colonies that adhere to the provisions of the treaty. Cane and beet sugar cannot be subject to different rates of duty. As Spain, Italy, and Sweden were non-exporting countries certain privileges were allowed them so long as they did not export sugar. The treaty also

provided for the establishment at Brussels of a permanent commission to have charge of the surveillance of the execution of its various provisions. September 1, 1903, was the date set for the treaty to go into effect, and it was to endure for five years. Formal notices of its ratification were to be forwarded to Brussels before February 1, 1903, and a number of these were duly received during the year, while the others were expected within the allotted time.

Sugar Crops of the World.—The following table from Willett and Gray's *Statistical Sugar Trade Journal*, gives the estimated entire sugar production of all the countries of the world, including local consumptions of home production wherever known.

	1902-03	1901-02	1900-01	1899-1900
United States—Louisiana	250,000	310,000	270,000	170,164
Porto Rico	100,000	85,000	80,000	85,000
Hawaiian Islands	315,000	317,509	321,461	258,521
Cuba, <i>crop</i>	880,000	850,181	635,856	308,543
British West Indies—Trinidad, <i>exports</i>	45,000	43,000	46,500	41,000
Barbados, <i>exports</i>	43,000	43,000	55,000	50,000
Jamaica.....	30,000	30,000	30,000	27,000
Antigua and St. Kitts	25,000	25,000	25,000	18,000
French West Indies—Martinique, <i>exports</i>	28,000	34,838	39,702	30,000
Guadeloupe	41,000	41,000	39,000	40,000
Danish West Indies—St. Croix	13,000	13,000	13,000	12,020
Haiti and San Domingo	45,000	45,000	45,000	45,000
Lesser Antilles, not named above	8,000	8,000	8,000	8,000
Mexico, <i>crop</i>	115,000	100,000	95,000	78,000

Grand total cane and beet sugar—tons.....	9,724,112	11,053,739	9,756,431	8,624,895
Estimated decrease in the world's production..	1,329,627

Sugar in the United States.—Aside from the agitation over the tariff on sugar imported from Cuba there were little discussion and few actual changes made in the tariff schedules. Sugars from the Philippines after March 8, 1902, were admitted at a reduction of 25 per cent. from the rates of the Dingley Bill, but the usual tariff of 1.685 per pound on sugar of 96° polariscope test was collected on all foreign sugar. In this, however, must not be counted that from the Hawaiian Islands (296,000 tons) and Porto Rico (82,700 tons) which was admitted free of duty. As the production of sugar was in excess of the demand it was natural that prices should fall and a low point was touched in July when the price was 3¼ cents a pound for centrifugal 96° test; this, however, improved, and in December sugar sold at 3.94, making an average for the year of 3.542 or .505 less than the average for 1901.

The consumption of sugar, raw and refined, consumed in the United States during

1902, as compared with 1901, is given in the accompanying table (Willett & Gray), which includes the more important statistics concerning the domestic consumption:

	1902	1901
Total consumption of all sugar, foreign and domestic, in the entire country, including Pacific Coast.	2,562,108 tons	2,372,316 tons
Increase over preceding year	133,972 "	152,469 "
	8 160 per cent.	6 858 per cent.
Consumption consisted of:		
Domestic cane	205,000 tons	202,150 tons
" beet	148,526 "	124,859 "
Maple	5,325 "	5,000 "
Molasses sugar	53,600 "	17,977 "
Total consumption—domestic sugars	473,451 "	430,986 "
" foreign cane sugar	1,971,236 "	1,672,529 "
" raw beet	96,918 "	217,286 "
" refined	24,503 "	42,515 "
Total production from foreign countries and insular possessions	2,092,637 "	1,932,330 "
Of which from Hawaii	311,139 "	300,070 "
" Porto Rico	84,827 "	66,279 "
" Philippine Islands	2,550 "	5,100 "
Total amount refined sugar consumed	2,521,350 "	2,287,828 "
Of which manufactured by A. S. R. Co.	1,436,474 "	1,325,406 "
" independent refiners	924,106 "	812,048 "
" beet-sugar factories	136,276 "	107,859 "
" foreign refiners	24,503 "	42,515 "
Percentage of refined manufactured by A. S. R. Co.	56.97 per cent.	57.9 per cent.
" independent refiners	36.65 "	35.5 "
" beet-sugar factories	5.41 "	4.7 "
" foreign refiners	.97 "	1.9 "
Consumption of sugar in raw or plantation state	44,479 tons	84,488 tons
Estimated undistributed stock of refined	30,000 "	30,000 "
National Sugar Refining Company production (included with independent refiners)	350,000 "	276,000 "
Average difference between raw and refined	.913c. per lb.	1.003c. per lb.

The consumption per capita was 72.8 pounds in 1902, 69.7 pounds in 1901, 66.6 pounds in 1900, 61.0 pounds in 1899, 63.5 pounds in 1898, 63.5 pounds in 1897, 60.9 pounds in 1896, 64.23 pounds in 1895, 66.64 pounds in 1894, 63.83 pounds in 1893, 63.76 pounds in 1892, 67.46 pounds in 1891, 54.56 pounds in 1890, 52.64 pounds in 1889, 54.23 pounds in 1888, 53.11 pounds in 1887, 52.55 pounds in 1886, 49.95 pounds in 1885, and 51 pounds in 1884.

The Division of Foreign Markets reports the exports of refined sugar from the United States for the year ending June 30, 1902, as 7,213,050 pounds, valued at \$292,715, and the imports of sugar as 3,031,915,875 pounds, valued at \$55,061,097.

Beet Sugar Industry.—Beet sugar manufacturing continues to grow and seems destined to occupy an important place among the industries of the United States. This growth has been steady and constant and sugar authorities express the opinion that while it would be greatly aided by duties on Cuban and colonial sugar, nevertheless such duties are not essential as sugar beets can be produced in this country as well as in Europe. From six factories producing 12,018 tons of sugar in 1892-93 the industry has increased until in 1902 there were 47 factories producing an amount of sugar estimated at 195,800 tons. During 1902 six new factories were added and five new ones were proposed for erection in the following year. The efficiency of these factories is continually improving, and better machinery and methods of operation are being introduced. The output as estimated by Willett & Gray for the season 1902-03, as compared with the statistics for the previous year, is given in the accompanying table:

STATES.	1902-03		1901-02	
	Estimate Beet Crop.	Estimate Sugar Production	Beets Received.	Sugar Produced.
	Tons *	Tons *	Tons *	Tons *
New York	26,785	2,500	42,354	4,049
Wisconsin	38,928	3,468	25,000	2,589
Ohio	12,946	1,339	25,000	3,126
Michigan	564,285	57,678	442,082	46,692
Minnesota	33,928	3,393	24,107	2,455
Nebraska	82,143	7,768	62,040	6,660
Colorado	272,320	29,643	181,842	19,977

*Tons, 2,240 pounds each.

In Europe beet sugar plays a far more active part than in the United States, and is manufactured to a greater extent than cane. The crop for the year 1902-03, as compared with previous years according to the estimate of Licht, the European sugar authority, is as follows:

	1902-03	1901-02	1900-01	1899-1900	1898-99	1897-98

Sugar Cane.—Progress continues in the direction of the erection of larger and better equipped sugar-houses at central points to which a number of cane-growers transport the sugar cane. Under this system the number of cane-growers is increasing. In recent years there has been an increasing shortage of labor in the cane fields and this is giving rise to improved devices and methods for handling cane. Distance and fertilizer experiments with sugar cane conducted by the East Java Experiment Station resulted in the largest yield and the highest percentage of sugar from rows 3.5 feet apart and a large increase in yield with better quality of cane from the use of commercial fertilizers. At the West Java Station washing the cuttings and treating them with Bordeaux mixture increased the number of growing buds and caused them to sprout earlier. The station maintained by the Hawaiian Sugar Planters' Association is conducting fertilizer and irrigation experiments with sugar cane. Under the conditions existing in Hawaii nitrate of soda in large quantities was harmful, but small applications were very useful. Cane trash as a fertilizer increased the yield of both cane and sugar. The results of the irrigation experiments favored the application of two inches of water at intervals of a week rather than smaller quantities. The experiments in the improvement of varieties of cane by selection carried on by the stations in Barbados and Java have already given useful results. Culture experiments at the Louisiana Station for four years resulted in favor of the use of the disk and middle cultivators. These implements can be adjusted to make small or large ridges and the depth can be regulated so that only a minimum amount of roots are cut in cultivating. This method was found to conserve moisture and to increase microbic action in the soil.

Sugar Beets.—Culture experiments in Egypt have shown that beets of high quality can be grown there. Upper Egypt is considered the best sugar-beet section because less cotton is grown there than in lower Egypt. At the New York State Experiment Station experiments with commercial fertilizers and stable manure on sugar beets resulted in beets of high quality from both methods of manuring. Stable manure, applied in the spring before planting, gave beets of somewhat better quality than commercial fertilizers and did not induce an excessive growth of leaves. Soil tests at the Michigan Station showed that clay loam soils produced the largest tonnage and the highest percentage of sugar, while muck soils produced beets usually so low in sugar content as to make them unprofitable for sugar manufacture. The exhaustive effects of the sugar-beet crop were observed by comparing the results on fertilized and unfertilized plats for three years. The decrease in yield on the unfertilized plats as compared with those receiving annually a normal application of fertilizers was 1.25 per cent. the first year, 11.25 per cent. the second year, and 13.85 per cent. the third year. At the Nebraska Station beets obtained from heavy soil were better in quality than those grown on light soil. Experiments in cultivating the beet crop showed that for hot, dry summers with high winds the soil mulch, in order to be effective, must be three or four inches thick. Late cultivation was also found effective in conserving soil moisture.

SULPHUR. See MINERAL PRODUCTION.

SUMATRA, the westernmost of the Dutch East Indies (*q.v.*), has an estimated area of 161,612 square miles and an estimated population of over 3,210,000. Dutch control, exercised through a governor under the governor-general of the East Indies, is merely nominal in the interior, while in the district of Achin the natives have contended against the authority of the Dutch ever since the latter took the island. The estimated area of Achin, which occupies the northwestern part of Sumatra, is 20,471 square miles; the population, which is almost wholly Moham-medan, was estimated in 1898 at 535,432. In 1873 the Dutch declared war on the

Achinese, and through the successful expeditions of General van Heutsz in 1898-99 it was thought that Dutch government had finally been established. But soon hostilities recommenced and there was considerable fighting in 1901 and 1902. In November of the latter year a motion was introduced in the lower house of the Dutch parliament by M. van Kol and five other Socialist deputies for the conclusion of a treaty of peace with the sultan and other chiefs of Achin on the basis of their complete independence. M. van Kol, who shortly before had visited Sumatra, held that although Achin was largely pacified, the sultan, who had always escaped capture, would be able to carry on guerilla warfare indefinitely. Still later in the year, however—as also at the end of 1901—the submission of the sultan to the Dutch seemed imminent.

SUNDAY-SCHOOL ASSOCIATION, NEW YORK STATE, an interdenominational organization, established in 1854, for the improvement and extension of Sabbath-school work. Several field missionaries are employed in the eight districts into which the counties of the State are divided. Among other activities the association conducts progressive normal instruction, offering five courses, in which are enrolled about 100 classes. The annual report (1902) of the treasurer shows total receipts for the work of the association amounting to \$11,892. There are now under its auspices 8487 Sunday schools, 50 new schools having been organized during the past year, with 1,283,474 members whose benevolent contributions aggregated \$396,508. The forty-seventh annual convention of the association was held June 10-12 in Saratoga Springs; that for 1903 will meet in Utica. Chairman of the executive committee, A. F. Shaffner, D.D.; secretary and treasurer, Timothy Hough; State superintendent, A. H. McKinney, Ph.D.; headquarters, 641 University Block, Syracuse.

SUNDAY-SCHOOL CONVENTION, INTERNATIONAL. The international Sunday-school lesson system was instituted in 1872 at a convention in Indianapolis, and from 1875 dates the beginning of the series of international conventions of Sunday-school workers, the tenth being held June 26-30, 1902, in Denver, Col. This last meeting, one of considerable interest, was attended by more than 1100 delegates from 54 States, provinces and Territories, and representing 25 denominations. The election for a new chairman of the executive committee resulted in the unanimous choice of W. N. Hartshorn, of Boston. The convention was characterized by progress in Sunday school methods, the lesson committee recommending several improvements, one of which was that of advanced courses designed to attract adult students. This recommendation, however, was rejected on the ground that it would break up the uniformity of the present courses. An important change was authorized by the convention in the adoption of an optional one year's course for beginners, which is to be supplied by the lesson committee in addition to the regular graded lessons. There was much discussion illustrating the tendency toward improvement which made the meeting "one of the greatest Sunday-school conventions ever held." A committee was appointed for an extended tour of the world in the interests of Sunday-school work. The International Lessons now have some 25,000,000 students, nearly 45 per cent. of whom are in this country; the normal classes number 1300 and are attended by 14,000 members.

SUNDAY-SCHOOL UNION, AMERICAN, an organization, founded in 1824, for the purpose of establishing Sunday schools in the United States wherever needed and to provide them with suitable literature. During the seventy-eight years of its existence, the union has organized 106,413 schools, having 600,271 teachers and 4,258,913 scholars and has given aid in 265,118 additional cases; it has distributed over \$9,000,000 worth of publications by sales and gifts. The record of the society for the year ending March 1, 1902, shows: New Sunday schools organized 1731, and old Sunday schools reorganized 644, with 9328 teachers and 84,415 scholars; Bibles distributed 9065, and Testaments 11,342. The American Sunday-School Union, which is supported entirely by voluntary contributions, has missionaries in every State, and its publishing interests are extensive and varied. Corresponding secretary, John R. Whitney, 1122 Chestnut Street, Philadelphia.

SUPRARENAL EXTRACT and its active principle adrenalin rendered increased usefulness during 1902. The drug is one of the most remarkable hemostatics and heart stimulants known. Internally it has been used with marked success in nose-bleed, pulmonary hemorrhage, uterine bleeding, hematuria, hemorrhage from the stomach and intestines, pneumonia, certain heart affections, and Addison's disease (a fatal malady, due to a destructive lesion of the suprarenal glands). Locally it is used as a hemostatic in the nose, and to shrink the mucous membrane and render it bloodless during operations, and to subdue the congestion of the nasal tissues in hay fever.

SVERDRUP, OTTO NEUMAN, an Arctic explorer, returned to Norway in 1902 after a four years' absence. Born in 1855 in Bindal, Heligoland, he followed the sea from the age of seventeen, passed his mate's examination in 1878, and afterwards, for some years, was commander of a ship in the merchant service. In 1888-89 he participated in the Greenland expedition, and in 1893 accompanied Nansen as commander of the *Fram*. In 1898, as leader of an expedition, he entered Baffin Bay with the *Fram*, which, after reaching the vicinity of Cape Sable, was imprisoned in the ice for a year. After proceeding some distance into Jones's Sound in the summer of 1899, his ship was again caught by the ice and was held for three more years. He had hoped to circumnavigate Greenland and might have made a dash for the pole if he had been able to establish a favorable base of supplies. The southwest and western coasts of Ellesmere Land were mapped, and islands were discovered north of the Peary Archipelago. He emerged from the polar ice in the summer of 1902, reached Goodhaven, Greenland, August 18, and returned to Norway in the autumn. See ARCTIC EXPLORATION.

SWAMI VIVEKANANDA, a Hindu religious reformer, died August 4, 1902, at Howrah, India. He came into prominence first about fifteen years ago when preaching in upper India, where he was drawing vast concourses of natives. He then went into retirement for a short time, and appeared later as a prophet of reformed Vedantism. He denounced the excess of sacerdotal ceremonialism, and the evil effects of the caste system, which he considered the chief cause of the degradation of the Hindus. In 1893 he came to the United States, where he attended the congress of religions at the World's Fair in Chicago, and established in New York the Vedanta Society, which was incorporated under the laws of the State in 1898, and of which Dr. Herschell C. Parker of Columbia University is president. He remained in America three years lecturing, and returned for a visit in 1900. In India he established two periodicals in the interests of the reformed faith, and his lectures in English are an important contribution to modern Hindu religious literature. The charm of his personality was everywhere felt, and was no doubt an important factor in the success of his preaching.

SWAYNE, WAGER, an American soldier, lawyer, and orator, died in New York City, December 18, 1902. He was born in Columbus, O., November 10, 1834, the son of Noah H. Swayne, an associate justice of the United States Supreme Court; and after graduating from Yale University in 1856, entered the Cincinnati Law School, from which he graduated in 1859. At the outbreak of the Civil War he was made major of the Forty-third Ohio Volunteers, and took part in Pope's Missouri campaign of 1861-62, in the capture of Island Number Ten, and in the battle of Corinth; and he later served with Sherman in the Atlanta campaign, receiving wounds at Balkahatchie that necessitated the amputation of a leg. While acting from 1865 to 1868 as assistant commissioner in Alabama of the Freedmen's Bureau, he established at Talladega the first school in the south for negroes, and by founding and assisting many other similar institutions, he rendered a lasting service to the cause of negro education. He was brevetted major-general U. S. A. in 1866. After his retirement from military service he practiced law in Toledo, O., until 1880, when he removed to New York City, and acquired a large legal practice. He was president of the Ohio Society of New York and was identified with several other organizations. In and around the metropolis he was a popular public speaker on many topics.

SWEDEN, a constitutional monarchy occupying the eastern portion of the Scandinavian peninsula. The capital is Stockholm.

Area, Population, etc.—The total area is 172,877 square miles, and the population January 1, 1901 was 5,136,441, almost all of whom are Scandinavian. The largest cities are Stockholm, population (1901) 303,356, and Göteborg, population 130,619. The state church is the Lutheran, its adherents numbering over three-fourths of the population in 1890. Attendance in the state elementary schools is free and compulsory, the attendance in 1899 being 741,109. There are universities at Uppsala and Lund, and medical, normal, and technical schools.

Government and Finance.—The executive authority rests with the king (also king of Norway), who is assisted by a responsible ministry of eleven members. The legislative power is vested in a diet of two chambers, a first chamber of 150 elected by municipal corporations and provincial diets, and the second chamber of 230 members chosen by popular vote on a suffrage restricted by certain property qualifications. The ruling sovereign, Oscar II., ascended the throne in 1872. The Swedish army consists of the *Värfvade*, or enlisted troops, the *Indelta*, or militia, and the *Värnpligtige*, or reserve. The total peace strength of the active army in 1901 was 37,200 officers and men. The navy, maintained wholly for coast defense, consists of ten first-class armored turret ships and about forty torpedo cruisers, torpedo boats, and gunboats. The monetary standard is gold, and the unit of value is

the krone. The budget figures for revenue and expenditure in 1901 balanced at 145,681,000 kroner, and in 1902 at 156,143,000 kroner. Customs and imposts constitute the chief sources of revenue, and the largest items of expenditure are for the army and navy and education. On January 1, 1901, the public debt, contracted entirely for the state railway construction, was 337,898,733 kroner.

Industries, Commerce, etc.—Cereals, principally oats, wheat, barley, and rye, are extensively cultivated, and the potato crop is valuable. Forests of pine, birch, and fur cover one-half of the country's area, and constitute by far the most important and valuable products. The mineral products are very rich. The iron mined in 1900 amounted to 2,607,925 tons. Silver, lead, copper, zinc, and manganese are also mined successfully, and the coal deposits have been extensively worked of late years. Manufactories of wood, iron, and steel works are of growing importance. The imports in 1899 were valued at 504,788,683 kroner, and the exports 388,184,767, of which timber was valued at 178,553,581 kroner. The trade is largely with Great Britain, Germany, Denmark, and Russia. In 1902 there were 7,192 miles of railway in operation of which 2392 belonged to the state.

History.—An event of both political and industrial significance was the strike in May, 1902, of the Social Democratic party in support of the suffrage movement. Simultaneously with the beginning of the debates in parliament on the suffrage bill, May 15, all the adherents of the party throughout Sweden stopped work, and in Stockholm, especially, there was a complete tying-up of business. Traffic of every kind was suspended, all factories and shops were closed, and the printing presses stopped running, 15,000 persons altogether joining in the strike. At Göteborg and Malmö only partial strikes occurred. At Helsingborg, as at Stockholm, the tie-up was complete. After three days the strike ended without disorder upon the promise of the government to introduce a bill in 1904 for broader suffrage reform. Both chambers agreed to the proposition, whereupon the labor leaders declared the strike at an end.

In July, 1902, a change of ministry occurred by the resignation of the Von Otter cabinet. Herr Erik Gustav Boström, a former prime minister, was charged by King Oscar with the formation of a new cabinet. The ministry as reorganized retained Herr von Lagerheim, as minister of foreign affairs. The new ministers were: Justice, Ossian Berger; finance, Ernst Meyer; interior, H. O. Westring; and public worship, Karl von Friesen. The old ministers for foreign affairs, marine, war, and agriculture were retained. The new cabinet was described as one friendly to suffrage reform, being constituted chiefly of Liberal members. In September the elections to the second chamber of the Riksdag occurred, and of the 230 members chosen 102 were Liberals (Left), 94 belonged to the Right (Conservative, or Rural party), and 32 were Independents, among the latter being 4 Social Democrats. The Liberals gained 25 and lost 13 seats; the Right won 3 and lost 26 seats; and the Independents won 15 seats, losing only 4. A legislative measure of importance was enacted by the parliament, establishing a progressive income tax to meet the cost involved in the reorganization of the army, provided for in 1901. Toward the end of 1902 the industrial situation was characterized by widespread distress on account of famine in Northern Sweden, due chiefly to the failure of crops and the scarcity of fish. About 70,000 persons were affected, many of whom were reported to be subsisting on pine bark ground to powder and mixed with stewed Iceland moss. It was estimated that \$6,000,000 would be necessary to save the population from decimation. About \$200,000 was subscribed for relief of the sufferers.

SWEDENBORGIANS. See NEW JERUSALEM, CHURCH OF THE.

SWIMMING. In 1902, E. Carroll Schaeffer of Reading, Pa., established, without a chance of doubt, his position as the leading amateur swimmer of the United States. He won all the events in the Amateur Athletic Union programme decided at Travers Island, N. Y., on July 12, August 23 and September 20, 1902, and in doing so set a number of new records across tidal water. Following are the results at the different distances: 220 yards, July 12, won by Schaeffer, 2 minutes 58.4-5 seconds; 880 yards, July 12, won by Schaeffer, 13 minutes 27.2-5 seconds (new American record); 440 yards, August 23, won by Schaeffer, 6 minutes 18.1-5 seconds (new American record); one mile, August 23, won by Schaeffer, 28 minutes 14.3-5 seconds (new American record); 100 yards, September 20, won by Schaeffer, 1 minute 7 seconds. In the course of these races, Schaeffer also made new American figures at intermediate distances, as follows: 330 yards, 4 minutes 53.4-5 seconds; 550 yards, 8 minutes 21.3-5 seconds; 660 yards, 10 minutes 4.4-5 seconds; 770 yards, 11 minutes 51.3-5 seconds; 990 yards, 15 minutes, 45.3-5 seconds; 1100 yards, 17 minutes 32 seconds; 1210 yards, 19 minutes 19 seconds; 1320 yards, 21 minutes 11 seconds; 1430 yards, 22 minutes 58.3-5 seconds; 1540 yards, 24 minutes 49.4-5 seconds; and 1650 yards, 26 minutes 34.3-5 seconds, thus giving him all records from 330 yards to one mile. In the 220 yards race, on July 12, he set a new record

for 110 yards, at 1 minute 19.3-5 seconds, afterwards reduced by C. Ruberl, New York Athletic Club, in the 440 yards race, on August 23, to 1 minute 17.1-5 seconds.

SWITZERLAND, a federal republic of central Europe bounded by Italy, France, Germany, and Austria. The capital is Berne.

Area and Population.—The aggregate area of the twenty-two cantons comprising the confederation is 15,976 square miles. The legal population by the census of December, 1900, was 3,315,443, and the actual population, 3,325,023. Racially the different elements of the population are about as follows: German, 70 per cent.; French, 23 per cent.; and Italian, 6.7 per cent. The German-speaking population in 1900 was 2,313,105; the French-speaking, 733,220; and Italian, 222,247. The populations of the principal towns (1901) were: Zurich, 152,942; Basel, 111,009; Geneva, 105,139; Berne, 64,864; and Lausanne, 47,039. Complete freedom of worship exists and there is no state church. Protestants constitute 59 per cent. of the population, and Roman Catholics 40 per cent.

Government, Finance, etc.—The present constitution, adopted in 1874, vests the legislative power in a parliament of two chambers, a state council of 44 members chosen two from each canton, and a national council of 147 members elected for three years by popular vote. The united houses, known as the Federal Assembly, elect a Federal Council of seven, for a three-year term, from whom they also choose annually a president for the federation and a vice-president for the council. The principles of initiative and referendum are in force. The powers of the cantonal administration, exercised generally through representative councils, extend to all matters not covered by the federal constitution. The president for 1902 was Joseph Zemp, of Entlebuch, and the vice-president, A. Deucher, of Thurgau, who, according to the generally accepted custom, was chosen president for 1903. There is no standing army, but a militia organization of 518,265 men exists, divided according to ages into three classes, the *Elite*, the *Landwehr* and the *Landsturm*. The chief source of revenue is the customs, there being no direct federal tax. The revenue in 1901 amounted to 101,924,682 francs, and the expenditure to 105,533,089. The budget estimates for 1902 were 102,240,000 francs for revenue, and 108,120,000 francs for expenditure. The public debt on January 1, 1901, was 92,424,387 francs.

Industries, Commerce, etc.—One-sixth of the area is under forests. Agriculture in the fertile valleys is in a high state of development, and valuable crops of wheat, oats, maize, barley, flax, hemp, and tobacco are raised. The manufacturing industries are various and extensive, consisting chiefly of silks, cottons, linens, lace, thread, clocks and watches, leather goods, gloves, pottery, and cheese. The imports in 1900, of which the principal items were foodstuffs, textiles, minerals, and machinery, were valued at 1,118,569,803 francs, and the exports 863,115,323 francs, the materials of greatest value being silks, cotton, and clocks and watches. The trade is largely with Germany, France, Italy, and Great Britain. There were in 1902 about 2400 miles of railway and 200 miles of tramway in operation. The ownership of the railway lines is at present being gradually transferred to the confederation.

HISTORY.

Relations with Italy.—In April, diplomatic relations with Italy were broken off on account of the publication by an anarchist paper of an article deemed insulting to the memory of the late King Humbert, and on account of the refusal of the Federal Council to prosecute the offender. When the Italian minister, Signor Silvestrelli, made a request for his prosecution, he was informed that a matter of this kind must be taken up through diplomatic channels and upon complaint of the government concerned. The controversy on this point eventually resulted in the Federal Council's demanding the recall of Signor Silvestrelli and the appointment of a new minister. This the Italian government refused to do and at once discontinued official relations with M. Carlin, the Swiss minister at Rome. Diplomatic relations were resumed on July 30, chiefly through the good offices of the German government. See ITALY (paragraph Foreign Relations).

Political and Legislative.—The general election to the national council, the membership of which owing to the increased population had been raised from 147 to 167, took place on October 26, and resulted in the return of a strong Radical-Democratic majority. On April 1 the new house of parliament, the construction of which was begun in 1894, was formally opened by the president of the confederation. One of the chief matters of legislative discussion was the electoral law providing for a rearrangement of the arrondissements and the redistribution of members of the national council. Out of the discussion grew a movement in favor of amending the constitution so as to distribute representation in the national council according to the number of Swiss inhabitants, instead of on the basis of the total population, as is now the case. A petition for a constitutional amendment on this question received the required number of signatures and will be duly submitted to the voters. Another measure which was the subject of discussion in the national legislature was

the proposition to make grants from the treasury of the confederation to the cantonal governments in aid of primary schools. It was finally agreed that this could not be done without an amendment to the constitution, and the Federal Council was accordingly authorized to present a constitutional amendment in the form of an additional article (not a revision).

An administrative measure of note was an order of the Federal Council, dated August 19, prohibiting the establishment of religious congregations and orders. This measure was adopted to meet the situation created by the settlement in Vaud and Valais of numerous religious associations which migrated from France after the passage of the French Associations law in 1901. The congregations were given ninety days in which to leave the country.

The Industrial Situation.—The industrial situation was marked by disorders and strikes in several localities, the local police reinforced by the confederation troops being called out to preserve order. In Geneva in the month of October a strike of 10,000 street car and building trade employees was brought about, the strikers alleged, by the refusal of the street car companies to comply with the arbitration decision by which a previous strike had been ended. For a time the strike resulted in the closing up of the shops and theatres and the suspension of the publication of the newspapers. During the progress of the strike some 300 persons were arrested, and of these 120 were expelled from the country. The employees resumed work on October 12.

SYRIA. See ARCHÆOLOGY and TURKEY.

TALC. See MINERAL PRODUCTION.

TALL BUILDINGS. The construction of tall buildings of steel and masonry went on with undiminished activity during 1902. While some of the new structures of the year were of considerable note, some of them called for engineering designs departing from well established and familiar standards, and the description of one will answer for the whole class as an illustration of recent practice. In some respects the most notable tall building of the year 1902 was the Fuller Building, or, as it is more commonly designated, the Flat Iron Building, in New York City. This building occupies the site bounded by Broadway and Fifth Avenue, between Twenty-second and Twenty-third streets, on a triangular lot, the apex of the triangle being at the junction of Broadway and Fifth Avenue at Twenty-third Street, and derives its name from the shape of the lot. The building is 21 stories high, about 285 feet above the curb. The great height of the building and its isolated site and comparatively small footing made the engineering problem in its construction quite different from that of most high buildings. The wind exposure was a factor to be considered, and the architect and engineer in dealing with it took especial pains to provide ample resistance against wind pressure. Special efforts were made to secure great rigidity in the construction and at the same time not interfere with either the windows or the interior arrangement of the building. The building of the heavy cornices was also a further feature of great attention in planning the construction.

To support the structure there are thirty-six main columns. A view of the building is deceptive as to the strength of its footings, as these extend under the sidewalk and give it a much greater breadth than is at first apparent. The masonry of the building is carried on plate girders, so that it rests on the steel construction, being practically curtain walls. The architects of the building were D. H. Burnham & Company, of Chicago.

TALMAGE, THOMAS DE WITT, an American clergyman of the Presbyterian church, died at Washington, D. C., on April 12, 1902. He was born at Bound Brook, N. J., January 7, 1832; studied at the University of the City of New York (now New York University), graduated in 1856 at the Reformed Dutch Theological Seminary, New Brunswick, N. J., was ordained to the ministry in the same year, was pastor of the Reformed Church at Belleville, N. J., from 1856 to 1859, and of that at Syracuse, N. Y., from 1859 to 1862. After a seven years' pastorate (1862-69) at the Second Church of Philadelphia, Pa., he took charge (1869) of the Central Presbyterian Church of Brooklyn, N. Y., later known as the Tabernacle Church, from the large new edifice constructed for its accommodation in 1870. This building was two years later (1872) destroyed by fire. A second, built in 1873, with seating capacity of 5000, and a third of further increased capacity, were burned in 1889 and 1894, respectively. Talmage's Brooklyn pastorate closed in the year last mentioned. The Tabernacle church, whose membership was, as last reported, 4447, then ceased to exist. Dr. Talmage in 1895 for a time conducted in the Academy of Music, New York City, a Sunday afternoon service, and from 1895 to 1899 was co-pastor of the First Presbyterian Church of Washington, D. C. He was editor in 1873-76 of *The Christian at Work* (New York), in 1877-78 of *The Advance* (Chicago), in 1879-89 of *Frank Leslie's Sunday Magazine* (New York), and from

THE FULLER ("FLAT IRON") BUILDING
New York

1890 of *The Christian Herald* (New York). His immediate pulpit influence, for many years so extensive, was greatly supplemented by the weekly publication of his sermons in 3600 religious and secular periodicals of various languages. He also appeared with success as a lyceum speaker. In 1884 he received the degree of D.D. from the University of Tennessee. Among his published volumes, including collections of sermons, are *The Almond Tree in Blossom* (1870), *Old Wells Dug Out* (1874), *Every-day Religion* (1875), *The Brooklyn Tabernacle* (1884), *From the Pyramids to the Acropolis* (1892), *From Manger to Throne* (1894), and several others. It is stated that the greater proportion of the works displaying his name were unauthorized compilations.

TAPPAN, FREDERICK D., an American banker, died in Lakewood, N. J., February 28, 1902. He was born in New York City, January 29, 1829, and was educated at the Columbia Grammar School and at the University of the City of New York, graduating from the latter in 1849. In the year following he became a clerk in the National Bank of New York, reorganized in 1865 as the Gallatin National Bank, rose in 1867 to be cashier, and in 1868 succeeded James Gallatin as president. His services to the New York Clearing House, which began in 1869, when he became a member of its conference committee, were manifold and constant. He was often a member and five times chairman of the clearing house committee, which is concerned chiefly with situations involving the possibilities of panic, was twice chairman of the conference committee, which superintends the general course of clearing-house operation, and was four times president of the Clearing House Association. His connection with banking interests lasted through a period of fifty years, and since 1873, when as chairman of the clearing house committee, he exerted a personal influence in all the emergencies that arose, his profound insight into financial and economic questions made him a dominant factor in the history and development of New York, and thus of American, banking.

TASMANIA, an island 80 miles south of Australia, forming one of the states of the Commonwealth of Australia, has an area of 26,385 square miles and a population (1901) of 172,475, an increase of 17 per cent. since 1891. Hobart, the capital, has a population of 34,682.

Government and Finance.—The executive power is exercised by a governor appointed by the crown (Sir Arthur Elibank Havelock, appointed 1902), assisted by a responsible ministry of 5 members. The legislative power is vested in a parliament consisting of a legislative council and assembly, both elected. The state revenue decreased from £1,054,980 in 1901 to £826,163 in 1902, and the expenditure from £923,731 to £870,442. The decrease in revenue was due to the shortage in tariff receipts, owing to the commonwealth tariff arrangements. The state debt in 1902 was £9,095,735.

Industries, Commerce, etc.—The chief agricultural products are wheat, oats, hay, and potatoes. Of more importance than agriculture are the mineral, timber, and live-stock industries. The exports of the principal minerals in 1901 were as follows: Copper, £1,026,748; silver, £325,335; tin, £12,542; and gold, £204,164. Imports and exports in the fiscal year 1901 amounted to £2,073,657 and £2,610,617 respectively; for 1902, £1,969,199 and £2,945,757. There were 618 miles of railway open for traffic in 1902.

History.—The parliament opened on July 23, 1902, and in his opening address Governor Havelock said that the federal tariff and the loss of the postal revenue rendered necessary a reduction in expenditures and an increase in direct taxation. The proposed parliamentary measures included a constitutional reform bill, a local government bill, and a bill for the revision of the liquor laws. The constitutional reform bill, it was later stated, proposed the consolidation of the two houses of the legislature, the new body to consist of 30 members, 10 of whom should be chosen on the senate franchise and 20 on the assembly franchise.

TAXATION. The United States Industrial Commission recommended in their final report (1902): (1) "That the States abandon the general property tax and realize their revenues by taxes upon corporations, inheritances and incomes, supplemented when necessary by indirect taxation.

(2) "That corporations, public service or other, be taxed by State boards at rates fixed by legislation, upon the value of their franchises, assessed according to the actual value of their stocks and bonded debts, and that the real estate owned by them be taxed locally, as other real estate is taxed.

(3) "That the system of levying graduated taxes upon inheritances be adopted by those States which do not now employ it, and that it be abandoned by the federal government.

(4) "That taxes upon corporations, inheritances, etc., be supplemented by a graduated tax upon incomes, to be levied and collected by the State.

(5) "That notes, mortgages, and other like property, be taxed by the State at

full value but at low fixed rates, through appropriate listing and recording systems similar to the Pennsylvania method. . . . Such taxes and other revenues of the State in excess of their needs should be distributed to counties or localities upon some equitable basis.

(6) "That to promote greater uniformity in State taxation and to consider interstate problems . . . the States provide for national conventions of fiscal officers.

(7) "That the general property tax upon real estate and tangible personality be supplemented by special taxes or licenses upon any business that is not by the general property tax made to bear its just share of the local public burden."

The taxation department of the National Civic Federation has made strong efforts to carry these recommendations into effect. At the national conference on taxation, held under its auspices at Buffalo, May 23-24, 1902, resolutions were adopted looking toward uniformity in taxation among the States, and the exemption of paper evidences of ownership or interest. Bulletin No. 1, issued by the department says: "The taxation department has secured the aid of a committee appointed by the 'State Boards of Commissioners for Promoting Uniformity of Legislation in the United States,' and it is intended at as early a date as possible to draft uniform laws on the several subjects of taxation, to be recommended to the State legislatures."

The widespread interest in taxation reform is attested by the fact that in three States constitutional amendments were proposed in 1902 conferring larger discretion on the legislature in the matter of taxation. The Ohio amendment gives the legislature a free field, except that public buildings, buildings devoted to public charity, and houses used exclusively for public worship, shall not be taxed, and personal property to the amount of \$200 shall be exempted. The Colorado amendments give the people of each county the right to decide every four years whether personal property and improvements on land shall be exempt from taxation, and limit the rate of the State tax to four mills. Franchises are excepted from both these provisions and may be taxed not more than six mills. The Minnesota amendments provide: (1) Special assessments by municipal authorities for local improvements; (2) annual tax upon franchises in addition to the tax on the real property and other personal property of the owner of the franchise; or, in lieu of this tax, a tax upon the gross earnings of the person or corporation holding such franchise may be imposed; the receipts accruing from this tax shall be apportioned between the State, counties and municipalities where the franchise is exercised, in the same manner as the revenues from real estate are apportioned; (3) an inheritance tax not to exceed 5 per cent. may be imposed on the estates of decedents above a fixed sum, which tax may be uniform, graded, or progressive; (4) a registry tax on real estate mortgages, a tax on the income from all credits, and also on the income from personal property; (5) an income tax on all incomes above \$1000 per annum, not otherwise taxed and not arising from property otherwise taxed. This tax may be graded or progressive or both and may not exceed 10 per cent. on credits and income from personal property, or 4 per cent. on other income. The usual exemptions are made; and the tax on gross earnings of railroads is retained.

In New York, Governor Odell worked toward the repeal of the franchise tax law, the taxation of corporations upon gross receipts, and the substitution of indirect taxation for the direct property tax. The governor's attitude was severely criticized by all except the holders of valuable franchises. Through the influence of the corporations, it is said, the Ford franchise tax bill was so amended as to provide that the assessment of franchises should be the duty of the State tax commissioners; but the corporations promptly refused to pay the taxes assessed in this manner, on the ground that it was unconstitutional. The appellate division of the State Supreme Court for the third department upheld their contention. Comptroller Grout said the decision did not affect the principle of the law. The case is to be carried to the Court of Appeals, and if necessary to the United States Supreme Court. Strong objection was made against the abolition of direct taxes in favor of indirect taxes. The latter, it is true, usually excite less opposition from the people, because the burdens and the evil effects are more or less obscured; but a "campaign of education" was begun looking toward a more rational reform than that proposed by the governor. It is coming to be generally recognized by tax reformers that there are two sources of injustice in taxation: (1) The escape from taxation of the beneficiaries of franchises; and (2) the escape from taxation of the beneficiaries of social increment of value, who do nothing and pay nothing for what they receive. The fallacy of attempting to tax mortgages and other intangible personality has been amply demonstrated. Michigan and Wisconsin have tried to assess all intangible property. The increase of assessments was almost entirely in mortgages, with the result that interest on farm loans was raised from 1 to 1½ per cent.—an amount much in excess of the tax rate. Indiana set out to assess bank deposits. These amounted to more than \$100,000,000, of which hardly

\$1,000,000 had ever been assessed. The assessors succeeded in getting most of the deposits, but the year 1901 found deposits greatly decreased, many millions having been withdrawn to other States. In Ohio the courts have ruled that railroads and municipal service corporations cannot be assessed on their franchises, the assessment being restricted to tangible property. The legislature in 1902 enacted two laws, the "Willis law," imposing an "excise tax" of one-tenth of 1 per cent. on the capital stock of domestic and foreign corporations employed in the State; and the "Cole law," imposing an "excise tax" of 1 per cent. on the gross revenues of public service corporations. Chicago, St. Paul, and New York City instituted reforms in assessments in 1902. The valuation of personal property was increased from \$21,000,000 to \$88,000,000 in Chicago by means of its board of review and the committees of citizens, who rate the business houses according to the volume of business done, regardless of the schedules filled out by each. St. Paul employed a scientific method of assessing buildings, according to the materials, the finish and age of each. By these means great inequalities of former assessments were discovered and corrected. In New York the assessment of property at its full valuation was instituted by Mayor Low. Heretofore assessments ranged from 7½ per cent. to 130 per cent. of full value. Assessment at full value was adopted for two reasons: (1) To equalize taxation, and (2) to increase the borrowing capacity of the city, since the State constitution limits the possible debts of the city to 10 per cent. of the assessed value of real estate. As a result the real estate valuation for 1903 was increased \$1,425,452,387, the figures for 1902 being \$3,330,647,579, and for 1903, \$4,756,099,966. The average increase is 40 per cent., that for Brooklyn is 27 per cent., while that for Manhattan is 48 per cent. Vacant lots were in some instances raised more than threefold. The assessment of personal property in New York City was increased from \$3,482,475,802 in 1902 to \$4,420,326,945 in 1903, an increase of 27 per cent. This increase has little meaning, however, for most of the personal assessment is "sworn off." In 1902 the personal property assessment of \$3,004,869,916 was reduced by this process to \$412,388,258, a reduction of 87 per cent.

TAYLOR, WILLIAM, an American clergyman of the Methodist Episcopal church, missionary-bishop for Africa of that denomination, died at Palo Alto, Cal., on May 18, 1902. He was born in Rockbridge County, Va., May 2, 1821, and after early experience as a farmer and tanner, in 1842 entered the ministry of the Methodist Episcopal Church. In the gold days of 1849-56 he was active in missionary duty in California, and for the five years succeeding continued his ministry in Canada and the New England States. He went out in 1862 as an evangelist to Australia, Africa, Asia, and South America. During his work in India (1872-76), and the South American countries, he established numerous self-supporting churches, and in his visit to South Africa he was very successful among the Kaffirs. In May, 1884, he was elected missionary-bishop for Africa; and on the Congo and at other points he established flourishing missions. It is said that his missionary travels included every English-speaking country of the globe. His published volumes are the personal records, *Seven Years' Street Preaching in San Francisco* (1856), *Christian Adventures in South Africa* (1867), and *The Story of My Life*, and the studies, *Ten Years of Self-Supporting Missions in India* (1882), and *Pauline Methods of Missionary Work* (1889).

TEMPLE, FREDERICK, ninety-fourth archbishop of Canterbury, died December 23, 1902, in London. He was born November 30, 1821, at Leukas, on Santa Maura, one of the Ionian Islands, graduated at Balliol College, Oxford, in 1842, with a double first class, and was ordained in 1846. After tutoring in mathematics at Balliol College, where he had secured a fellowship in 1848, he became principal of Kneller Hall, near Twickenham, in 1855 inspector of schools, and in 1858 head master of Rugby, where he did much to revive the prestige the school had enjoyed under Thomas Arnold. In 1860 he acquired a reputation for a tendency toward rationalism, owing to the appearance of his name as one of the authors of the famous *Essays and Reviews*, which caused a storm of theological controversy at the time. It has since been admitted that Dr. Temple's own contribution to the volume, an essay on "Education and the World," contained little that would nowadays be considered dangerous, and probably it was more the company in which he found himself that gave him a name for heterodoxy. But so strong was the impression made by the incident that when in 1869 he was nominated by Gladstone (whose Irish Church disestablishment measure he had supported) as bishop of Exeter, a loud outcry was made against the appointment which found expression even in a public and formal protest at the time of the confirmation of the election. His subsequent career, however, as bishop and archbishop, showed the groundlessness of these suspicions. Inflexibly just, he favored no one party in the Church,

but in many points his later teaching and practice commended him rather to the High Church school than to the Broad churchmen, among whom he had been thought to stand. In 1869 he became bishop of Exeter, was Bampton lecturer at Oxford in 1884, and in 1885 was transferred to the diocese of London. In 1896 he was consecrated archbishop of Canterbury. Two of the most widely important events of his primacy were the decision in the case of the bishop of Lincoln, who was brought to trial for alleged ritual irregularities, and the learned and dignified reply which in 1897 (in conjunction with his brother primate, archbishop of York) he made to the Papal declaration of the invalidity of Anglican orders. Among his last official acts, performed when failing in strength, were the coronation of Edward VII., and a speech on the education bill before the House of Lords. He published *Sermons Preached at Rugby; The Relation Between Science and Religion* (the Bampton lectures); and *Tracts and Pamphlets*. He was a man of unflinching zeal and earnestness, and especially active in movements for the welfare of the working classes and for temperance.

TEMPLE, Rt. Hon. Sir RICHARD, first baronet, a British authority on Indian affairs, died in London, March 17, 1902. He was born at Kempsey, England, in 1826, was educated at Rugby and the East India Company's College, Haileybury, and entered the civil service in Bengal in 1846 as secretary to Sir John Lawrence. His period of service in India extended from that year until 1880 and included several important offices. He first became chief commissioner of the Central Provinces and political resident of Hyderabad, and from 1868 to 1874 was foreign secretary to the governor-general and finance minister of India. During the famine in the latter year he was in charge of the measures for relief for Bengal. He was appointed lieutenant-governor of Bengal in 1875, and in 1877 governor of Bombay. In 1885, five years after his return to England, he was elected to the House of Commons, of which he was a member for ten years. In 1876 a baronetcy was conferred upon him. He wrote the following books: *India in 1880; Men and Events of My Time in India* (1882); *Oriental Experience* (1883); *Cosmopolitan Essays* (1886); *Palestine Illustrated* (1888); *The Story of My Life* (1896); *Sixty Years of the Queen's Reign* (1897); *A Bird's Eye View of Picturesque India* (1898). He held the degrees of D.C.L. and LL.D., the former from Oxford and the latter from Cambridge and Montreal.

TENNESSEE, a central southern State of the United States, has an area of 42,050 square miles. The capital is Nashville. Tennessee was admitted as a State on June 1, 1796. The population in 1900 was 2,020,616, and in June, 1902, as estimated by the government actuary, 2,073,000. The populations of the four largest cities in 1900 were: Memphis, 102,320; Nashville, 80,865; Knoxville, 32,637; and Chattanooga, 30,154.

Finance.—There was on hand in the treasury of the State of Tennessee on December 20, 1901, \$222,614.45. The total receipts for the fiscal year amounted to \$2,755,513.70, and the expenditures to \$2,555,570.55, leaving a balance on hand on December 19, 1902, of \$422,557.60. The main items of revenue and the amounts derived therefrom were: County trustees, \$1,148,832.60; county court clerks, \$454,526; circuit court clerks, \$40,526.89; insurance fees, \$161,238.92; railroad taxes, \$200,360.13; state penitentiary, \$532,406.02. The total debt at the end of the year was \$16,021,466, of which \$675,166 was unfunded. The debt was reduced during the year by the amount of \$504,787.67, 10 per cent. of the gross revenues of the State being paid monthly into a sinking fund for the retirement of the bonds.

Agriculture and Industries.—The principal farm crops of Tennessee for 1902, according to the *Crop Reporter*, were: Corn, 3,337,047 acres, 73,081,329 bushels, \$34,384,225; winter wheat, 840,381 acres, 6,050,743 bushels, \$4,598,565; oats, 186,071 acres, 3,219,028 bushels, \$1,351,992; potatoes, 26,405 acres, 1,037,110 bushels, \$1,047,750; hay, 357,049 acres, 514,151 tons, \$6,066,982; tobacco, 59,830 acres, 38,889,500 pounds, \$3,888,050.

While nearly all the other cotton States in 1902 had crops 10 to 15 per cent. below the average, the Tennessee yield was 10 per cent. above the ten-year average. The census bureau reported that on December 13 the 815 cotton gins in operation had ginned 272,135 bales, and it was estimated that 34,409 bales remained in the hands of the growers. These figures show a total crop of 306,544 bales, worth approximately \$13,800,000. The mines in the eastern part of the State underwent considerable development. The production of pig-iron increased from 337,139 tons in 1901 to 392,778 tons in 1902. Shipments of phosphate increased from 409,650 tons in 1901 to 437,500 tons in 1902. The principal development in the textile industry was in and about Nashville. In 1902 two knitting and four cotton mills were constructed. The latter had an equipment of 30,500 spindles and 700 looms.

Conventions and Platforms.—The Democratic national convention was held at Nashville on May 29. The Kansas City platform and the attitude of Democratic

members of Congress were indorsed; then followed declarations denouncing trusts; favoring tariff for revenue only; condemning the ship subsidy bill, and the Republican position on the Philippines; and favoring the speedy restoration of peace in the East, and the granting of independence to the Filipinos. The platform declared against the increased standing army, denounced Republican extravagance, favored the construction of the Nicaragua Canal, expressed sympathy for the Boers, and favored liberal commercial relations with Cuba. The convention also indorsed the Democratic State administration and approved the passage of the measure providing for the liquidation and retirement of the State funded debt; it favored State legislation to equalize tax burdens, and urged the adoption of a law requiring the union label on State printing, and the enactment of laws to improve the public roads of the State.

The Republican national convention was held at Nashville on June 18. The platform favored legal restraint of monopolies, denounced the attacks on American soldiers in the Philippines, and extended thanks to Senator Lodge of Massachusetts for defending the army in the Senate. The reform of the State Election law was called for, including the adoption of the Australian ballot system.

Elections.—At the regular biennial State election, held November 4, 1902, the Democratic candidates for governor, treasurer, comptroller, and railroad commissioners were elected. The vote for governor was Frazer (Dem.), 98,954; Campbell (Rep.), 59,002, giving Frazer a plurality of 39,952. The result was affected by the unfortunate feud in connection with the murder of Governor Goebel. The Anti-Saloon League, which was an important factor in the State legislative campaign, was successful beyond all expectations, the house of representatives going overwhelmingly its way, while in the senate the League gained a small majority. The State legislature for 1903 will consist of 28 Democrats and 5 Republicans in the senate, and 83 Democrats and 16 Republicans in the house.

State Officers.—For 1902: Governor, Benton McMillin; secretary of state, John W. Morton; treasurer, R. E. Folk; commissioner of agriculture, Thomas H. Paine; superintendent of public instruction, M. C. Fitzpatrick (elected to Congress); comptroller, Theodore F. King; attorney-general, Charles T. Cates, Jr.—all Democrats. For 1903: Governor, James B. Frazer, elected for two years, term ending January, 1905; secretary of state, John W. Morton, until February, 1905, term 4 years; treasurer and insurance commissioner, R. E. Folk, February 1903, term 2 years, re-elected for 2 years; commissioner of agriculture, Thomas H. Paine, June, 1901, term 2 years; superintendent of public instruction, to be appointed; comptroller, Theo. F. King, February, 1903, term 2 years, re-elected for 2 years; attorney-general, Charles T. Cates, Jr., August, 1903; railroad commissioners, John N. McKenzie, Thomas L. Williams, N. P. Baptist, chairman—all Democrats.

Supreme Court: Elected in August, 1902, to hold office for eight years: Chief justice, W. D. Beard; associate justices, John S. Wilkes, W. K. McAlister, M. M. Neil, and John K. Shields—all Democrats.

For congressional representatives, see UNITED STATES (paragraph Congressional Representatives).

TENNYSON, second Baron, HALLAM TENNYSON, second son of the late Alfred, Lord Tennyson, was appointed governor-general of the Australian Commonwealth in 1902, shortly after the resignation of the Earl of Hopetoun under circumstances which attracted some attention to the expense of maintaining that office. In default of a capital of the new commonwealth, and until an official residence shall be built, the governor-general is asked to reside part of the time at Melbourne and part at Sydney. But while the Australians required this, they were not willing to increase the governor's salary of £10,000, and Lord Hopetoun resigned because of insufficient official funds to keep up two establishments. Some arrangement is understood to have been made by which his successor, Lord Tennyson, will be saved undue expense in this respect. The latter was born August 11, 1852, was educated at Marlborough College and at Trinity College, Cambridge, and succeeded to his father's title in 1892. His *Memoir* (1897) of his father was remarkably well received and manifested considerable literary ability. The poetic gift, however, he has not inherited, but he has done well in the administrative offices to which he has been called. He was appointed governor of South Australia in 1899, and occupied that position until promoted to be governor-general. See AUSTRALIA, COMMONWEALTH OF.

TEXAS, a southwestern State of the United States, has an area of 265,780 square miles. The capital is Austin. Texas was admitted to the Union December 29, 1845. The population in 1900 was 3,048,710, and in June, 1902, as estimated by the government actuary, 3,229,000. The populations of the three largest cities in 1900 were: San Antonio, 53,321; Houston, 44,633; Dallas, 42,638.

Finance.—The cash balance in the treasury of the State of Texas on September 1, 1901, was \$2,579,419.21. Cash receipts during the fiscal year, including transfers,

amounted to \$9,021,822.22, and cash disbursements, including transfers, \$9,400,417.58, leaving a balance on September 1, 1902, of \$2,200,823.85. The main items of revenue and the amounts derived therefrom were: General revenue, \$3,371,209.75; available school fund, \$3,636,891.55; permanent school fund, \$1,780,193.42. The total bonded debt of Texas on September 1, 1902, was \$3,989,400, of which nearly the entire amount was held by the school and charitable funds. The assets of these funds at the end of the year, including cash, bonds, and leased land, amounted to \$45,071,876.36, of which \$40,283,330.84 was held by the permanent school fund.

Agriculture and Industries.—The principal field crops of Texas for 1902, according to the *Crop Reporter*, were: Corn, 5,539,187 acres, 44,867,415 bushels, \$29,612,494; winter wheat, 959,253 acres; 8,633,277 bushels, \$6,647,623; oats, 896,869 acres, 20,807,361 bushels, \$10,195,607; potatoes, 26,704 acres, 1,762,464 bushels, \$1,498,094; hay, 424,718 acres, 594,605 tons, \$5,113,603; rice, 200,000 acres, 2,000,000 bags, \$15,000,000.

With the exception of rice, fruit and vegetables, Texas crops were poor in 1902. The census bureau reported 2,167,472 bales of cotton ginned by December 13, and estimated that 188,968 bales remained yet in the hands of the planters, showing a crop of 2,356,440 bales, or about 20 per cent. less than the 1901 crop. The value of the crop was estimated at \$106,000,000. Texas was the only State showing a decrease from the 1901 cotton crop. This was due to hot, dry weather in August, and more especially to boll-weevils. Special agents of the United States Department of Agriculture estimated that \$10,000,000 damage was done in 1902 by the boll weevils.

Texas holds first rank in horse and cattle raising, the farm animals in the State, January 1, 1903, comprising 1,291,458 horses, valued at \$38,901,293; 407,161 mules, \$20,861,205; 813,852 milch cows, \$18,116,346; 8,007,910 other cattle, \$109,698,754; 1,736,603 sheep, \$3,541,803; and 2,312,315 swine, \$10,174,186. The drought in early summer compelled Texas cattle-owners to ship to the northwest for pasturage. Before July 10, the Colorado and Southern Railroad had carried 4003 carloads of cattle from Texas to points near Denver. The Beaumont oil field, which suddenly increased Texas's production of petroleum from 800,000 barrels in 1900 to 4,393,660 barrels in 1901, continued to develop. The yield in 1902 was estimated at about 25,000,000 barrels. A number of very productive wells were struck at Sour Lake and Saratoga. Some wells that had been good producers were abandoned on account of salt water. Shipments from the Spindle Top field were, in 1901, 1,501,968 barrels, and in 1902, 11,506,482 barrels. Three knitting mills and three cotton mills were built in Texas in 1902, the latter containing 12,492 spindles and 160 looms. At the end of 1902 there were 16 rice mills in the State, as against 5 in 1900. A number of cottonseed-oil mills were built. At the end of 1902 they numbered 150, representing a capital of \$10,000,000. The railroad mileage, exclusive of yard tracks and siding, was, in December, 1902, 10,884 miles. The railroad commissioner reports that the average freight rate per ton mile was, in 1899, 10.73 mills; in 1902, 9.58 mills. About 479 miles of track were built during 1902.

Constitutional Amendment.—At the November election, an amendment to the State constitution, making the payment of a poll tax of \$1.50 on or before February 1 of each year a qualification for suffrage, was voted upon and carried. About nine-tenths of the negroes will be disfranchised by this provision. Two-thirds of the amount collected from this tax is to be set apart for the public free school fund, and the remaining third will be credited to the general revenue fund. The Republican convention, under white control, failed to respond favorably to the request of the negroes that this poll tax should be opposed, and the subject was not mentioned in the platform. The offensive and aggressive attitude of the negroes, who vote much and pay little in taxes, led to the adoption of the amendment. The demand of the negro Republicans that a negro representative be placed in nomination for some minor State office on the Republican ticket, was denied them by the white Republicans. The only nominations made by the Republican convention were for the offices of governor and treasurer, both nominees being white men.

Conventions and Platforms.—The Democratic State convention was held at Austin on July 17. The platform reaffirmed the principles embodied in the Kansas City platform, declaring the belief of the party in Texas that, with Democratic success in 1904, "the dangers of imperialism, centralization, trusts, monopolies, mergers, and other combines hurtful to our people, unjust taxation and kindred evils would no longer confront our country." Trusts were condemned and the isthmian canal project was approved. In State matters the administration of Governor Sayers was approved; the employment of short-term convicts in the improvement of the public roads and upon the farms was urged, also the re-enactment of uniform textbook laws, and the provision of textile schools as a department of industrial education in the Agricultural and Mechanical College. The passage of a law prohibiting the employment of children under twelve years of age in factories

using machinery was asked for, and a demand was made for uniform election primaries, also the abolition of passes on railroads.

The Republican State convention was held at Fort Worth on September 11. In the platform, the President and the administration were strongly endorsed. The establishment of a port of entry adjacent to the Beaumont oil field was asked for, also national and State aid for the protection of the rivers and valleys of the State from overflows.

The Populist State convention was held at Fort Worth on August 12. The platform emphasized the necessity for adoption of the initiative and referendum as the only method by which the people can express themselves fully and freely on political questions. This convention adopted the name "Allied Populist Party."

Elections.—At the regular biennial State election, held November 4, 1902, a full Democratic State ticket was elected. The vote for governor was Lanham (Dem.), 218,959; Burkitt (Rep.), 56,678, giving Lanham a plurality of 162,281. The legislature for 1903 will consist of 31 Democrats in the senate and 129 Democrats, 1 Republican, and 1 Populist in the house.

State Officers—For 1902: Governor, Joseph D. Sayers; lieutenant-governor, J. N. Browning; secretary of state, J. G. Tod; treasurer, John W. Robbins; comptroller, R. M. Love; superintendent of public instruction, Arthur Lefevre; commissioner of agriculture, Charles Rogan; attorney-general, C. K. Bell; railroad commissioners, John H. Reagan, L. J. Storey, Allison Mayfield—all Democrats. For 1903: Governor, S. W. T. Lanham (elected for 2 years, term ending January, 1905); lieutenant-governor, G. D. Neal; secretary of state, J. R. Curl; treasurer, J. W. Robbins; comptroller, R. M. Love; superintendent of public instruction, Arthur Lefevre; commissioner of agriculture, W. C. Clay; attorney-general, C. K. Bell; railroad commissioners, O. B. Colquitt, L. J. Storey, Allison Mayfield—all Democrats.

Supreme Court in 1902 and 1903: Chief justice, R. R. Gaines; associate justices, T. J. Brown and F. A. Williams.

For congressional representatives, see UNITED STATES (paragraph Congressional Representatives). See GALVESTON SEA WALL.

TEXAS, UNIVERSITY OF, Austin, Tex., founded 1883, had in 1902 about 1300 students and a faculty of 109 members. The gross income for the year was \$275,393, with gifts amounting to \$5000. The law course was extended to three years, and provision was made for new departments in electricity and mechanical engineering. It was decided by the university authorities to give no degrees after 1906, except that of Bachelor of Arts, thus making the former degrees of Bachelor of Literature and Bachelor of Science equivalent to the customary degree in arts. The library contained 40,000 volumes.

THAYER, JAMES BRADLEY, an American educator and author, died at Cambridge, Mass., February 14, 1902. He was born at Haverhill, Mass., January 15, 1831, and after preparing himself for college entered Harvard University, from which he graduated in 1852. He completed the law courses in 1856, after having supported himself throughout his entire college career, and began the practice of his profession in Boston as a partner of William J. Hubbard, whom he succeeded as a master in chancery in 1864. His wide reputation led to his appointment in December, 1873, to the Royall professorship of law in Harvard University, the duties of which he fulfilled from 1874 until 1893, when he was made Weld professor. In 1891 he received from the Iowa State University the degree of LL.D., which was granted also by Harvard three years later. A place on the Philippine commission was offered him in 1900 by President McKinley, but was not accepted. He contributed widely to newspapers and magazines, edited the twelfth edition of Kent's *Commentaries*, and published *Letters of Chauncey Wright* (1878); *A Western Journey with Mr. Emerson* (1884); *Memorandum of the Legal Effect of Opinions Given by Judges to the Executive and Legislature Under Certain American Constitutions* (1885); *The Teaching of English Law in Universities* (1892); *Cases on Evidence* (1892); *The Origin and Scope of the American Doctrine of Constitutional Law* (1893); *Cases on Constitutional Law* (1895); *The Development of Trial by Jury* (1896); *A Preliminary Treatise on Evidence at the Common Law* (1898).

THIBET, a country of central Asia, nominally a division of the Chinese Empire, but practically under the rule of the lamas, or Buddhist priests. The capital is Lhasa, a city that hitherto has been virtually inaccessible to foreigners. The estimated area is 651,500 square miles, and the estimated population 6,000,000. In 1901 and 1902 Russia was suspected of scheming to extend her influence over Thibet, and in the summer of the latter year it was alleged that a treaty between the two countries had been concluded. Little substantiating evidence, however, was forthcoming.

An expedition, sent out by the Russian Geographical Society and led by Capt.

P. K. Kozloff, that since 1899 had explored Thibet and the desert of Gobi, besides other parts of Mongolia, returned to St. Petersburg in January, 1902. Much important work was accomplished by the expedition, which numbered 38 men, including several scientists. Surveys aggregating about 8000 miles were made, the positions of 40 localities were determined astronomically, daily meteorological observations were taken, and there were collected a large number of geological, botanical, and zoological specimens. The explorers also obtained valuable historical and ethnographical information. In eastern Tsaidam, northeastern Thibet, a meteorological station was organized by four members of the expedition, who remained there and for many months recorded observations that afford a good basis for calculating altitudes in the country.

THOMPSON, Rt. Rev. HUGH MILLER, Protestant Episcopal bishop of Mississippi, died November 18, 1902, in New York City. He was born June 5, 1830, in Londonderry, Ireland, and when a child was brought to the United States. He received his theological degree in 1852 at the Nashotah Theological Seminary, Wisconsin, and, after serving in several churches in Wisconsin and Illinois, he was elected professor of church history in that institution. At the same time he became editor of the *American Churchman*, a position which he held until the paper was incorporated with the *Churchman* in 1870, when he undertook the editorship of the *Church Journal* and the *Gospel Mission*, and became rector at St. James's, Chicago. He was rector at Christ Church, New York, from 1871 to 1875 and at Trinity, New Orleans, from 1876 to 1883. In 1883 he was consecrated assistant bishop of Mississippi and became bishop four years later. He wrote several books, but his missionary work left him little time for writing during the last ten years. Among his works are: *Unity and Restoration*; *Kingdom of God*; *The World and the Logos*; *The World and the Wrestlers*.

TIELE, CORNELIS PETRUS, a Dutch theologian and historian, died January 11, 1902. He was born in Leyden, Holland, December 16, 1830; studied theology in Amsterdam, held pastorates in Mordrecht (1853), and Rotterdam (1856), was a lecturer in Rotterdam from 1856 to 1872, and in 1877 was called to the chair of history of religion in the University of Leyden. He wrote the important article "Religions" for the *Encyclopædia Britannica*, and was accounted the greatest European authority on the comparative history of religion. Among his publications, which include valuable works on the history of Christianity, and various other historical studies, and which have been translated into many languages, are: *De godsdienst van Zarathustra* (1864); *Vergelijkende geschiedenis der Egyptische en Mesopotamische godsdiensten* (1869-72); *Geschiedenis van den godsdienst tot aan de heerschappij der wereldgodsdiensten* (1876), better known under the title of its German translation, *Kompendium der Religionsgeschichte* (1887); and *Babylonisch-assyrische Geschichte* (1886-87).

TIFFANY, CHARLES LEWIS, an American merchant, died in New York City, February 18, 1902. He was born in Killingly, Conn., February 15, 1812; and, after an elementary education in the district school and in the Plainfield Academy, started in business in his native village. In 1837 he went to New York City, and in partnership with John B. Young established the stationery and fancy goods store which, after many changes, resolved into the well-known jewelry firm of Tiffany and Company. In time many European branches of the firm were established, the importation of historic gems and other famous works of art was successfully undertaken, and the uniform excellence of the firm's productions did much to inspire continental respect for the United States as the home of artistic workmanship. The sterling silver standard of .925 fine, which was introduced by the Tiffany company in 1851, was accepted by other leading silversmiths until it became the standard throughout the country. Mr. Tiffany was created a chevalier of the French Legion of Honor in 1878, and was frequently honored by the rulers of other European nations.

TIN. Deposits of tin ore (cassiterite) were worked during 1902 in the York region of Seward Peninsula, Alaska. The locality is on the Arctic slope of the peninsula, near a range of hills, and about eight miles east by north from Cape Prince of Wales. The tin occurs along the bed-rock of small streams which rise in the highlands, its source being referred to veins in slate. While the richest deposits carry about 8 pounds of ore per cubic yard, the remoteness and conditions of climate are such serious obstacles to development that no important supplies of tin may be expected from this region. The imports of tin into the United States in 1902 were 42,522 short tons, valued at \$21,263,337.

TISSOT, JAMES JOSEPH JACQUES, a French painter and engraver, died August 9, 1902. He was born at Nantes, October 15, 1836; studied at the Ecole des Beaux Arts, and first exhibited at the Salon in 1859. Water colors, etchings, and a smaller number of pictures in oil by him were thereafter to be seen at the annual expositions.

tions. He obtained a medal at the Salon of 1866, and a gold medal at the Exposition Universelle of 1889. In 1886 he sailed for the East to begin topographical and historical studies introductory to his best-known achievement, a series of water colors illustrating the life of Christ. This important undertaking he completed in 1896. He went, he says, "as a devout pilgrim"; his aim was to show in their exact appearance and proportions the places associated with the Gospel, in regard to which he believed the world had been deceived by the fancies of mediæval painters and their subsequent imitators. "I have only desired," his words are, "to give a personal interpretation, based upon serious study, and intended to dispel as much as possible an inaccurate and vague view from people's minds." The entire collection of 350 water colors and 112 pen and ink drawings, after wide exhibition in the United States, was acquired for the sum of \$60,000 by the Brooklyn Institute of Arts and Sciences and hung in the gallery of that institution. Elaborate color prints, prepared under the supervision of the author, and with an accompanying text, appeared as a *Life of Our Lord Jesus Christ*. Other works by the artist are: "Promenade in the Snow" (1859); "Confidants" (1867); "The Retreat in the Garden of the Tuileries" (1868); "The Departure," "In Distant Lands," "The Return," "The Fat Sheep" (all 1883), and "On the Thames."

TISZA, KOLOMAN, an eminent Hungarian statesman, died at Budapest, March 21, 1902. He was born at Grosswardein December 16, 1830, a member of the noble Protestant family of Borosjeno. He studied law and entered the civil service in the department of education, but on the outbreak of the revolution in 1848 resigned, and although ill-health prevented his active participation in the revolutionary movement he warmly sympathized with it. After a brief period of foreign travel and study he returned and occupied himself with the management of the family estates at Geszt, where he took an active part in local affairs. In 1859 he attracted wide attention by his opposition to Count Thun's attempt to regulate Protestant communions in Hungary. In 1861 he was elected to the Képviselőház, or lower house of the Hungarian parliament, where he at once attained prominence as the leader of the group of moderate Liberals, who were opposed to the party of Deák. After the compact of 1867 (with Austria) had been arranged, Tisza and his followers refused at first to accept it, contending that the only connection between Austria and Hungary should be the personal one of the sovereign. After the withdrawal of Deák and Andressy left the old Deák party without a strong leader, it rapidly became disorganized, and in 1874, through administrative mismanagement, was compelled to relinquish its power. A coalition ministry was then formed under Baron Wenckheim, in which both Deák's and Tisza's followers were represented, and Tisza himself, the controlling spirit, held the portfolio of the interior. Eight months later, on Wenckheim's retirement, Tisza, on October 17, 1875, became premier. From that time until his resignation, March 12, 1890, he was the real ruler of Hungary, and with a strong and unified Liberal party behind him, was able to reorganize and solidify the Hungarian administration in such a manner as to increase constantly the Magyar power and influence in the dual monarchy. Twice, in 1877 and 1887, he negotiated a renewal of the *Ausgleich*, each time securing better terms for Hungary. He placed the finances of the kingdom on a sound basis, reorganized the local governments in the direction of a more highly centralized system, secured complete free trade between the two halves of the monarchy, and did much to promote the internal prosperity of the kingdom, particularly in the development of the state railways. The election of 1887 gave him an apparently indefinite lease of power, but some disparaging remarks about Kossuth led to violent scenes in parliament, culminating in an adverse vote which brought about his resignation on March 12, 1890. He continued an active and influential member of the lower house until his death, representing Grosswardein until 1901 when, being defeated by a Kossuthist, he was returned from Transylvania.

TOBACCO. The tobacco crop of 1902, taken as a whole, was an unusually large one, and the amount of cigar leaf tobacco raised is announced as the largest ever reported. All of the ten principal tobacco-growing States except Pennsylvania report average yields per acre in excess of their ten-year averages. In nearly all sections the crops were unusually sound and clean. The most unfavorable feature of the season was the cool, cloudy weather of late summer, which retarded the maturity of the crops. In the Chemung Valley of New York, and Pennsylvania, the excessive rains injured many fields and reduced the number of acres harvested. Wisconsin led all other States this year in the production of cigar leaf tobacco, and the crop in Ohio was fine. The amount of tobacco carried over from last year was reduced very low, so that the demand for every crop of tobacco possessing merit is excellent and higher prices have prevailed than for years.

The production of tobacco of all kinds, as reported by the United States Department of Agriculture, was 821,823,963 pounds, valued at \$80,472,506. This crop was

grown on 1,030,734 acres, the average yield per acre being 797.3 pounds. Kentucky produced the largest amount, 257,755,200 pounds, North Carolina 142,520,950 pounds, Virginia 136,769,250 pounds, Wisconsin 64,885,480 pounds, and Ohio 55,709,865 pounds. The production of cigar leaf tobacco, as estimated by the *American Agriculturist*, was as follows (cases of 350 pounds each): Wisconsin 179,500 cases, Ohio 128,600, Pennsylvania 92,000, New England States 83,000, New York 22,000, and Southern States 13,900, a total of 519,000 cases, as compared with 346,983 in 1901 and 420,303 in 1899.

The growth of Sumatra tobacco under cloth shade, which has been experimented upon for two years in Connecticut was undertaken on a commercial scale last year, about 700 acres being raised by 35 growers. The average yield of barn-cured product was about 1200 pounds an acre, and the quality was quite equal to that grown previously on the experimental plats. It is thought that the price will average fully \$1 a pound. Small tracts were grown under cloth in New York, Pennsylvania, Ohio and Wisconsin, in an experimental way; and considerable quantities were raised in Georgia and Florida, where its culture in this country first started. In the latter States, lath shade has been largely substituted for cloth. In Georgia, where the drought injured the crop the past year, irrigation was tried with such success that it is said many irrigation plants will be put in for the coming season. As indicating the economy of the Sumatra leaf for cigar wrappers, the Connecticut experiment station found that a pound and a quarter of the leaf would wrap 1000 cigars, whereas at least nine pounds of broad-leaf grown in the open was required to wrap that number. Shading makes the leaf much thinner, and more elastic.

The home consumption of cigar-leaf tobacco for cigars and cigarettes continues to show an enormous increase, as does the manufacture of smoking and chewing tobaccos and snuff. The report of the commissioner of internal revenue, as summarized by *Tobacco Leaf*, shows that the following amounts of cigars, cigarettes, etc., were produced during the calendar year:

	1902	1901
Cigars (number).....	6,483,983,497	5,919,322,142
Little cigars (number).....	707,288,491	748,629,883
Cigarettes (number).....	2,745,705,171	2,403,327,965
Manufactured tobacco (pounds).....	313,858,881	299,250,860
Snuff (pounds).....	18,406,377	17,121,241

A feature of the tobacco business has been the steady increase in the manufacture of cigars since 1897, and the decline in cigarettes. In 1897, about four and one-half billion of each were made. The number of cigarettes decreased steadily up to last year. This is partly due to the growth in favor of the little cigars. The amount of tobacco used for cigar making increased from 78,736,071 pounds in 1897 to 116,388,262 pounds in 1901. The internal revenue receipts from taxes on tobacco for the fiscal year ended June 30, 1902, amounted to \$51,718,258.45.

During the fiscal year ended June 30, 1902, there were imported from Cuba 18,892,782 pounds of wrapper and filler tobacco, valued at \$8,578,297, from the Netherlands 5,527,789 pounds, valued at \$4,835,699, and from Turkey (European and Asiatic combined), 3,186,852 pounds, valued at \$1,176,723. The total importation of filler and other tobacco (not including manufactures) during the fiscal year was 29,428,837 pounds, valued at \$15,211,671.

The exports of tobacco during the calendar year, as summarized by *Tobacco Leaf* from returns of the Treasury Department, were as follows:

EXPORTS OF DOMESTIC AND FOREIGN TOBACCOS AND THEIR PRODUCTS, 1902.

DOMESTIC TOBACCO.	Amount.	Value.	FOREIGN TOBACCO.†	Amount.	Value.
Leaf *.....	353,317,385	\$34,393,294	Leaf suitable for wrap-		
Stems and trimmings *	10,751,955	247,221	pers *.....	1,076,679	\$788,328

* Pounds.

† Thousands.

‡ Passed the custom house in transit.

The value of the exports of domestic leaf and manufactured tobacco was therefore \$40,163,749, and of the foreign \$1,615,664; as compared with \$32,238,321 and \$1,334,771, respectively, in 1901. These exports went mainly to the United Kingdom, Germany, France, Italy, Netherlands, Belgium, and Canada.

The tobacco imports, taken from the same source, were as follows:

IMPORTS OF TOBACCO, 1901 AND 1902.

	1902		1901	
	Amount.	Value.	Amount.	Value.
Leaf suitable for wrappers (pounds)	5,650,420	\$4,074,431	6,250,994	\$5,831,354
All other (pounds) ..	26,541,812	11,546,995	21,757,586	10,358,572
Total leaf (pounds)	32,192,214	\$16,221,416	28,017,580	\$16,190,526
Cigars, cigarettes and cheroots (M) .	479,046	\$2,616,531	475,666	\$2,504,287
All other		78,101		85,616
Total		\$2,694,632		\$2,589,903

TOBAGO. See TRINIDAD.

TOGOLAND, a German protectorate in West Africa between the Gold Coast and Dahomey, has an estimated area of 33,000 square miles, and an estimated population of 2,500,000. It is administered by an imperial commissioner, stationed at Lome. For the fiscal year 1903 the estimated revenue (including an imperial contribution of 1,015,000 marks) and expenditure balanced at 1,650,000 marks. (The mark is worth 23.8 cents.) Commerce is expanding. In 1896 imports and exports amounted to 1,886,840 marks and 1,231,250 marks, respectively; in 1900, 3,516,786 marks and 3,058,903 marks; in 1901, 4,722,900 and 3,689,550. The leading imports are cotton goods and alcoholic liquors. The chief exports in 1900 and 1901 were valued in marks as follows: Palm kernels, 1,422,340 and 1,798,370; palm oil, 1,015,024 and 1,474,740; rubber, 521,372 and 260,613. Attempts are being made to develop cotton culture. It was announced in the spring of 1902 that the construction of a wharf at Lome would soon be begun. At that time construction had begun on a coast-line railway from Lome to Seguro and Little Popo.

TONQUIN, the northernmost division of the French colony of Indo-China (*q.v.*) lies on the Gulf of Tonquin, between China on the north, and Anam (of which it was formerly a dependency) on the south. The area is estimated at 119,660 square miles, and the population at between 7,000,000 and 12,000,000. The seat of the government is Hanoi, with 150,000 inhabitants. Tonquin was formerly a vice-royalty of Anam, but since 1897 the administration has been in the hands of a French resident. The local budget balanced in 1901 at 4,197,950 piastres. The chief crop is rice, mostly exported to Hong Kong. Silk, the production of which reaches 500,000 kilogrammes annually, sugar-cane, cotton, coffee, tobacco and fruits are also produced for export. Copper, coal and iron are mined. The imports in 1900 were valued at 63,800,000 francs (28,500,000 francs from France and French colonies) and the exports at 40,025,000 francs (4,225,000 francs to France and French colonies). For railway construction, see **INDO-CHINA**.

TRACY, HARRY, a criminal, while serving a sentence of twenty years for assault and robbery dating from 1899, escaped from the penitentiary at Salem, Ore., after killing three guards and wounding a fourth. Leaving his prison on the morning of June 9, 1902, in company with a confederate, Merrill, whom he soon murdered from fear of betrayal, Tracy began the most desperate fight for liberty that is recorded in the criminal annals of America. For two months he wandered back and forth through Oregon and Washington, forcing the inhabitants to provide food, clothing, shelter, and transportation. As he passed from one county into another, a new sheriff with a large posse renewed the chase, but, though several times surrounded, Tracy either fought his way to safety or eluded his pursuers by clever tactics, and it was not until August 5 that he was forced to die by his own hand to prevent capture alive.

TRADE UNIONS. There are several labor organizations in the United States which are independent of the American Federation of Labor (see **FEDERATION OF LABOR, AMERICAN**), and at least two organizations that profess a rivalry or open antagonism to that organization. The American Labor Union is a socialistic body, composed of the Western Miners' Union and some smaller associations which split off from the American Federation of Labor, in 1902. (See **SOCIALISM**.) It advocates the radical Social Democratic platform, and has a strength variously estimated from 20,000 to 160,000. It is too early to judge what will be the result of this new movement. As yet the only apparent effect has been to weaken and disturb the larger labor organization. The Knights of Labor has existed since 1878 and was at one time the most powerful labor organization in the country; but with the advent of the American Federation of Labor, with its sounder principles of association, the Knights of Labor has dwindled in numbers and influence. It now claims a membership of 200,000. The officers are: General master workman, John W.

Hays; general worthy foreman, I. H. Sanderson; general secretary-treasurer, I. D. Chamberlain, Washington, D. C. In addition to these organizations there are several independent labor unions, the most important of which are: Brotherhood of Locomotive Firemen, president W. F. Arnold, Peoria, Ill.; Brotherhood of Railroad Trammens, president A. E. King, Cleveland, O.; Order of Railroad Conductors, president W. J. Maxwell, Cedar Rapids, Ia.; Brotherhood of Locomotive Engineers, president C. H. Salmons, Cleveland, O.; Brotherhood of Railroad Switchmen, president M. R. Welsh, Buffalo, N. Y.; Stone Cutters' Association, president J. F. McHugh, Washington, D. C.; Bricklayers and Masons, president William Dobson, North Adams, Mass.; Brotherhood of Operative Plasterers, president T. A. Scully, Indianapolis, Ind.; National Association of Letter Carriers, president E. J. Cantwell, Washington, D. C.; Postoffice Clerks, president Charles Dvorak, Chicago, Ill.; Stone Masons' International Union, president John Reichwein, Indianapolis, Ind.

A significant event was the visit of the English labor union representatives to America. See GREAT BRITAIN (paragraph Mosely Commission).

The labor unions of AMERICA were much wrought up over the Taff-Vale decision in England, and sent numerous expressions of sympathy to their brethren across the water. They seem to have overlooked a decision by the New York courts involving the same principle of responsibility for damages. It was held by the court that incorporated trade unions can be sued under the code of civil procedure through actions brought against their officials, and the property of the association bound by the judgment given. The principle here laid down makes compulsory incorporation unnecessary. If followed out it will have exactly the same effect here as the Taff-Vale decision in England. This interpretation may, no doubt, work hardship in some cases, and if passed will be most violently combated by the unionists; but the general principle that there can be no power without responsibility will scarcely be abrogated in favor of labor organizations. The *Report on Trade Unions in the United Kingdom for 1901* was issued in November, 1902. It shows a membership at the end of 1901 of nearly 2,000,000. The 100 principal unions have a membership of 1,161,226 and a reserve fund of £4,161,916, or £3 11s. 8½d. per man. The unions grew in numbers but slightly during that year, owing to the general depression in industry, and the growing unpopularity of trade union methods. Morally the unions have hardly held their own during 1902, for trade unionism is blamed for the crippling of English industry, and the opposition has been stronger and more aggressive than ever before. The Taff-Vale decision and the cases arising under it have permanently weakened English trade unionism, a wound that must prove mortal unless the unions can find some new way of coercing non-union labor and employers without laying themselves liable to damage. The Taff-Vale case, decided in 1901 by the House of Lords, involved directly only the right of a court to enjoin a union from a certain form of picketing, but the decision that the union could be made a party to a suit carried with it the doctrine that the funds of such an association were liable to attachment in a verdict for damages. In a case decided in the latter part of December, 1902, the officers of the Amalgamated Society of Railway Servants were found guilty of maintaining a system of picketing and terrorism to bring about a strike and prevent the employment of non-union men, and were held responsible for damages to the railway company to the amount of £27,000. Labor unions everywhere are much excited by these decisions. The Webbs declare that they strike at the very life of trade unionism. Efforts are being made to induce Parliament to reassert the old doctrine that a trade union cannot sue or be sued, but there seems to be no prospect of carrying such a measure through. There can be no doubt that the labor unions have greatly hampered industry in Great Britain. They adhere rigidly to the "ca' canny" system; they limit output, reject improved machinery, and rigidly prescribe the number of apprentices. British manufacturers constantly complain of strikes and disturbances to industry. Cost of building was increased 15 per cent, mainly because of restrictions upon output and lessening the hours of labor. A glass manufacturer reports that the output per man has decreased 25 per cent. in a dozen years. The labor unionists hold that there is only a certain amount of work to be done, and that by limiting hours and output more workmen will be employed, and so a more general distribution be effected. The manufacturers assert that the application of these ideas is sending industry out of the country and putting England behind Germany and America. Compulsory arbitration is violently opposed by the trade unions; the vote "by card"—that is, by the number of members represented by each delegate voting—for the last three years shows a growing opposition to it. In 1900 the vote was 246,000 for, 939,000 against; in 1901 it was 366,000 for, 676,000 against; in 1902 it was 303,000 for, 961,000 against. The chief ground for the hostility to official settlement of labor disputes on the part of the unions is the fear that arbitration courts will be unfavorable to the cause of labor. The fourth trade union

congress of Germany was held in September, 1902. For the first time the imperial government felt compelled to send representatives other than policemen to the meetings. Fifty-eight central bodies having a membership of 691,118 were represented by 150 delegates. A report on organization among women laborers showed a membership of 23,699 for women's unions. In 1892 there were but 4355 women in unions. According to the industrial report for 1895, there were 822,176 women employed in shops and factories in Germany. The congress asked that prison labor be limited to the least possible competition with free labor. A report on laborers' protective insurance declared it to be the duty of the state to guarantee support to the laborer during scarcity of work. This should not be called poor relief or be attended by loss of political rights. A resolution was passed declaring that only trade union men should be supported thus. An important move was the establishment of a fund for the organization of labor unions and founding a sick fund. Accordingly a monthly tax will be collected, to be administered by the trade union officials, for the care of invalids, widows, and orphans.

TRANSVAAL, formerly the South African Republic, became a colony of the British crown by proclamation September 1, 1900. It occupies a plateau in the interior of South Africa between the Vaal and Limpopo rivers. The area is 119,139 square miles and the population, both native and white, according to an estimate of 1898, was 1,094,156, of whom 245,397 were whites. The largest towns are Johannesburg, population (1899) 105,000, and Pretoria, the capital, population (1899) 12,500. The white inhabitants are largely adherents of the United Dutch Reformed (formerly the state church) and other Dutch and English Protestant denominations. In 1897 there were 11,552 pupils enrolled in the public schools.

Government, Finance and Industries.—The British colonial administration, which superseded that of the old South African Republic, has not yet been wholly organized, owing to the necessity of maintaining military rule in a great part of the region during the continuation of hostilities. The lord high commissioner for South Africa (Lord Milner) is the titular governor, and is represented in the colony by a lieutenant-governor (Sir Arthur Lawley). When civil government is completely restored the governor will be assisted by an executive council and an elected legislative council. Representative municipal and local government will be established, the old Boer laws and customs being respected as far as possible, and a new system of law courts established. In 1897 the republic's revenues were £4,480,218, the expenditures £4,394,066 and the debt (1898) £2,675,690. Estimates for 1902-03 placed the revenue at £4,000,000, and the expenditure at £3,702,765—figures which if reasonably correct show that the effect of the war on the industrial life of the country was not so severe as was generally supposed. The imports in 1897 were valued at £13,563,827. For the first ten months of 1902 the value of the imports was stated to be £9,241,131. The chief exports are gold, wool, hides, cattle and ostrich feathers. Stock raising and mining are the principal industries. Agriculture is still very little developed, but its possibilities are great. Gold, the most important mineral product, was mined to the value of £16,044,135 in 1898. During 1902 the gold mines were gradually reopened. Coal (in 1898 1,907,805 tons), diamonds (valued, 1898, at £43,730), copper, silver, iron and lead are also mined. The length of railway lines open in 1898 was 774 miles, with 270 miles under construction and 252 projected.

HISTORY.

Military Operations.—The year opened with the military situation of the preceding months practically unchanged. It was estimated that about 10,000 Boers were still in the field, while the total strength of the British army in South Africa was 237,800 officers and men. The Boer forces were broken up into small bands, and their operations consisted chiefly in the prosecution of guerilla warfare. De Wet in particular distinguished himself in this sort of fighting, and his achievements will rank among the most brilliant of the sort in history. Skirmishes, ambushes, and sudden attacks, rather than large campaigns and battles, characterized the final stages of the struggle. The steady extension of the block-house system and the practice of harrying the Boer forces materially reduced their numbers and resources, though not without several important losses to the British. An incident of the operations in January was the execution by the British authorities of Commandant Scheepers, who was captured in October, 1901, tried by court-martial and found guilty of offenses against the usages of war. De Wet's unusual activity led in February to a determined effort to surround and capture him, near the north boundary of the Orange River Colony, but he succeeded in escaping on a dark night by rushing the line with a herd of cattle in front, with a loss of two or three hundred men. A cleverly managed "drive" on the 27th of February resulted in the killing or capturing of over 800 Boers, with large numbers of horses, cattle, arms, etc. Early in March the British suffered a reverse at Klerksdorp from an attack by General Delarey, their loss in killed, wounded and captured being 632 men and five guns. A greater

disaster was sustained on March 7, when General Lord Methuen, with 900 mounted troops and 300 infantry with 4 guns and a pom-pom, marching from Vryburg to Lichtenburg, was attacked by General Delarey with 1500 Boers. The British forces were assailed on three sides, 500 of their number being chased a distance of four miles. Four pieces of British artillery with all their supplies and a large number of prisoners including General Methuen were captured. Owing, however, to the Boer custom of liberating prisoners, General Methuen soon obtained his release. The capture of the second senior British officer and the rout of the British forces was the last military achievement of note in the war. Minor incidents which marked the closing stages of the struggle were: The capture by General French of Commandant Kritzingen in Cape Colony; the formation of several corps of Boer volunteers for service on the British side under the name of "National Scouts"; a serious railway accident at Barberton, resulting in the death of 40 men and severe injuries to 40 more; the execution of a number of Australian officers in the British service for murdering Boer prisoners; and successful "drives" against the Boers, resulting in the capture of a number of prisoners.

Peace Negotiations.—As stated in the article on Great Britain (*q.v.*) the British government refused the offer of mediation proposed by the Netherlands on January 25, on the ground that it could not accept the intervention of any foreign power in the settlement of the differences with the Boers. It contended, moreover, that the Boer delegates in Europe had no authority to treat, as all powers of government were vested in Mr. Steyn and Mr. Schalk-Burger, and therefore the "quickest and most satisfactory means of arranging a settlement would be a direct communication from the leaders of the Boer forces to the British military authorities." It was accordingly decided that all peace negotiations must take place not in Europe but in South Africa. Mr. Schalk-Burger at once informed Lord Kitchener that he was prepared to offer proposals for peace, and on March 22 he, with other members of the "acting Transvaal government," had a conference with Lord Kitchener at Pretoria. As a result of this conference they obtained a safe conduct and departed for Kroonstad to consult with General De Wet, Mr. Steyn and other "irreconcilables" of the former Orange Free State. A more general conference of Boer leaders was held at Klerksdorp April 9, after which they all proceeded to Pretoria, where terms of peace were prepared acknowledging the independence of the two republics. These terms the British government promptly declined to consider and informed the Boer leaders that unless a more serious proposal was made, no further communications from them would be received. The British negotiators were then asked to state the terms they were willing to grant, the Boer negotiators promising to submit them to the burghers. The British authorities thereupon proposed the terms substantially offered in the previous year (see paragraph on Terms of Peace), and Lord Kitchener undertook to see that the burghers had an opportunity to meet and discuss the terms proposed. Safe conducts and passes were granted as requested, and on May 16 some 60 Boer delegates were assembled at Vereeniging to deliberate on the British proposals. A special commission of five was appointed to wait upon Lords Milner and Kitchener at Pretoria to obtain better terms, including self-government under certain restrictions, but their efforts were without avail. The Boers agreed to surrender part of their territory and give up the right of managing their foreign relations in return for limited self-government, but this was refused. Finally articles of peace were agreed upon, laid before the delegates and accepted by a vote of 54 to 6. The articles of peace were formally signed by the negotiators at Pretoria, May 30.

Terms of Peace.—The following were the terms of peace agreed upon by Lords Kitchener and Milner on behalf of the British government, and by Messrs. Steyn, Brebner, De Wet, Olivier and Hertzog for the Orange Free State; and Messrs. Schalk-Burger, Reitz, Botha, Delarey, Meyer and Krogh acting for the South African Republic:

(1) The burghers to lay down their arms, to hand over all their guns and ammunition and to desist from further resistance to the authority of King Edward VII., whom they shall recognize as their lawful sovereign.

(2) All burghers in the field outside the limits of the Transvaal or Orange River Colony and all prisoners of war at present outside South Africa who are burghers and who shall declare their acceptance of the position of subjects of Edward VII. to be gradually brought back to their homes as soon as transports can be provided and means of subsistence insured.

(3) The burghers so surrendering or returning are not to be deprived of their personal liberty or property.

(4) No proceedings, civil or criminal, are to be taken against any of the burghers for any acts in connection with the prosecution of the war, but the benefits of this clause are not to extend to certain acts contrary to the usages of war.

(5) The Dutch language is to be taught in the public schools of the Transvaal and Orange River Colony where the parents of the children desire it, and is to be allowed in the courts of law when necessary for the better and more effectual administration of justice.

(6) The possession of rifles is to be allowed in the Transvaal and Orange River Colony to persons requiring them for their protection on taking out a license according to law.

(7) Military administration in the Transvaal and Orange River Colony is at the earliest possible date to be succeeded by civil government, and, as soon as circumstances permit, representative institutions leading up to self-government will be introduced.

(8) The question of granting the electoral franchise to natives will not be decided until after the introduction of self-government.

(9) No special tax to be imposed on landed property to defray the expenses of the war.

(10) As soon as local conditions permit a commission on which the inhabitants will be represented will be appointed in each district for the purpose of assisting the restoration of the people to their homes, and supplying those who, owing to the losses of the war, are unable to provide themselves with food, shelter and the necessary amount of seed stock, implements, etc., indispensable to the resumption of their normal occupations.

The British government further agreed to place at the disposal of the above mentioned commission the sum of £3,000,000 for the purposes mentioned. In addition to the free grant of £3,000,000 the government announced its willingness to make loans for the same purposes free of interest for a period of two years and afterwards repayable over a period of years with 3 per cent. interest.

In agreeing to these terms the British government announced that the punishment of the British subjects in Cape Colony and Natal who joined the Boers in the war should be left to the respective governments concerned and in accordance with their own laws. It was announced at the same time that the Cape government had decided that the rank and file of such persons who should sign a document acknowledging themselves guilty of high treason should be punished by disfranchisement, provided they were not guilty of murder or other acts contrary to the usages of civilized warfare. Certain classes holding official positions or certain military rank are to be tried for high treason, but in no case is the death penalty to be inflicted. The Natal government made the general announcement that rebels subject to her jurisdiction should be dealt with according to the law of the colony. On November 6 Parliament in pursuance of the terms of surrender voted a grant of £8,000,000 to aid the Transvaal and Orange River Colonies for the ensuing year. Of this amount £3,000,000 was appropriated for the aid of the burghers, £2,000,000 to British sufferers from the war, and £3,000,000 for loans as provided in the terms of the surrender.

The End of the War.—After the acceptance of the above terms Lord Kitchener visited the Boer camp at Vereeniging and in a public address congratulated the Boers on the splendid showing which they had made in the unequal struggle. He welcomed them as subjects of the British Empire and asked for their cooperation in restoring harmony and promoting the welfare of the country. Arrangements were then made for the formal surrender of Boer armies. Generals Kitchener, Hamilton and Eliot were appointed commissioners to receive the arms of those surrendering. Under the direction of the Boer leaders the men came in promptly and gave up their arms. The total number who surrendered was over 21,000. Those who were supplied with transportation and rations returned at once to their farms with their wives and children. Others were permitted to remain within the British lines until provision could be made for their transportation. The king telegraphed his congratulations to Lord Kitchener on the ability which he had displayed throughout the war and in the settlement of the issues involved and raised him to the rank of general. Special thanksgiving services in commemoration of the peace were held in a number of towns and cities in South Africa as well as elsewhere, and a solemn commemorative service attended by the royal family was held at St. Paul's Cathedral, June 8. In a farewell address to the troops before leaving South Africa, Lord Kitchener expressed his thanks to the officers and men for their services during the war and at the same time referred to the soldierly qualities and the admirable spirit displayed by their enemies throughout the struggle and in carrying out the terms of the surrender. Appreciation of the services of those Boers who served in the English ranks was also expressed.

Expenditures, Enlistments and Casualties.—A parliamentary statement issued in April estimated the cost of the war, including interest on the war debt, as follows.

YEAR.	Amount.	YEAR.	Amount.
1899-1900	£23,217,000	1902-1903.....	£63,600,000
1900-1901	65,120,000		
1901-1902	71,037,000	Total.....	£222,974,000

A revision of the budget in May reduced the estimate of the total cost to £206,224,000. Of this amount more than £140,000,000 was raised by loan.

A statement of the war department issued in September gave the following particulars with reference to British troops engaged in the war:

Garrison in South Africa, August 1, 1899.	9,940	From India—	
From Great Britain—		Regulars	18,229
Regulars	228,171	Volunteers	305
Militia	45,666		18,534
Yeomanry	35,520	From Colonies—	
Scottish Horse	833	Colonial contingents	29,000
Volunteers	19,856	South African Constabulary (Canada)	1,238
South African Constabulary	7,273		30,328
	337,219	Raised in South Africa	52,414
		Total troops engaged	448,435

The colonial contingents and contributions were distributed as follows:

COLONY.	Number of Men.	Expenditure.	COLONY.	Number of Men.	Expenditure.
Canada	8,400	£620,000	West Australia	1,165	£51,646
New South Wales	6,208	391,620	Tasmania	796	38,393
Victoria	3,897	138,327	New Zealand	6,000	334,000
Queensland	2,903	203,164			
South Australia	1,494	82,068	Total	30,863	£1,859,218

A war office report in June placed the casualties as follows:

	Officers.	Non-commissioned Officers and Men.
Killed in action	518	5,256
Died of wounds	183	1,835
Died in captivity	5	97
Died of disease	339	12,911
Accidental deaths	27	771
Total	1,072	20,870
Missing		103
Sent home as invalids	3,116	72,314
Total casualties South African field force	4,188	93,289
		97,477

With regard to the Boer expenditures, enlistments and casualties no reliable statistics are available. According to estimates made by the Red Cross Society the total Boer enlistments from first to last did not exceed 75,000, while the total losses during the war were 3700 killed or died of wounds and 32,000 prisoners.

Boer Generals in Europe.—On August 16 Generals Botha, Delarey, and De Wet arrived in England and soon after were received by Mr. Chamberlain and later by the king on board the *Victoria and Albert*. On August 23 they sent a communication from Brussels, where they had gone to attend the funeral of Gen. Lucas Meyer, to Mr. Chamberlain asking for an interview for the purpose of discussing certain questions relating to conditions in South Africa. Among the questions proposed for discussion were: Amnesty; annual grants for widows, orphans, and disabled burghers; use of Dutch language in schools and law courts, and compensation for loss and confiscation of property.

Mr. Chamberlain replied, expressing surprise at these proposals and insisted that the generosity of the terms granted was unparalleled in history. Most of the proposals, he said, constituted a suggestion for a new agreement, and he had no power to reopen the points already settled. The Boers responded by saying that they had accepted the terms of peace as an ultimatum for the purpose of avoiding the further effusion of blood and that they desired to procure just treatment for themselves and for those who cast in their lot with them. Mr. Chamberlain thereupon asked for and received formal assurances that if an interview was accorded no subject inconsistent with the settlement reached in the terms of surrender would

be raised. The interview was accordingly granted and took place at the colonial office September 5 in the presence of General Kitchener and various officials of state. With regard to the various points raised in the course of the interview, Mr. Chamberlain insisted that the policy of the British government was as liberal and just as could be permitted. He explained that the question of amnesty for the excepted classes was being disposed of by a royal commission; agreed that the composition of the commission to distribute the £3,000,000 should include men of practical experience; expressed the opinion that the government could not undertake to do more for the widows and orphans; and promised that martial law should soon be put an end to. On September 23 the Boer generals issued a manifesto in the shape of an appeal to the civilized world recalling the struggles in South Africa, reciting the refusal of Great Britain to grant further assistance and calling for outside aid for the destitute and in the education of the children. The appeal continued: "Our people are completely ruined. It has been impossible to make a complete inventory, but we are convinced that at least 30,000 houses on Boer farms and many villages were burned or destroyed by the British during the war. Everything was destroyed and the country was completely laid waste. The war demanded many victims, the land was bathed in tears and our orphans and widows were abandoned." On November 6 Mr. Chamberlain wrote to General Botha, characterizing the appeal as conveying an incorrect and exaggerated impression of the circumstances to which it referred and saying that the promise of the government to assist them by way of loans on easy terms still held good. Furthermore, he said, the government had already expended over £3,000,000 on the burgher camps and was still expending £200,000 annually for that purpose, with the result that the lives of thousands of women and children had been saved, and intimated that large sums had been transmitted from the Transvaal during the war to Europe in the interests of the republic and he could not doubt that a large balance remained which would be used for the relief of the burghers and their families. Large sums, he said, had been spent by the government for the support and education of the children and large sums were being spent to refurnish the country with live stock and farming implements.

Other Events of the Year.—On June 21 Lord Milner assumed office as governor of the Transvaal, the formal ceremony taking place in the council chamber at Pretoria. In July a lieutenant-governor was appointed. The names of members of the executive council were announced at the same time. A supreme court and inferior courts were established. In October the customs tariff was revised by reducing the duties on agricultural implements, certain machinery and building materials. By an ordinance of November 19 martial law was abolished in the Transvaal and various special regulations for the public safety were substituted. At the same time it was announced that the concentration camps would be continued for six months longer. With regard to educational measures it was announced that a maximum of five hours per week, where the parents desired it, should be allowed in the public schools for instruction in the Dutch language, Bible history and religion. The problem of repatriating and resettling the Boer prisoners was one of the first to claim the attention of the new government. For this purpose local commissioners were appointed in each district under a magistrate to supply them with the necessary food, shelter and farming implements. By September 25 23,944 persons had been returned to their farms, leaving about 29,000 still in the camps. By the middle of November all but 7600 had been repatriated, and by January 1, 1903, only the indigent and disabled prisoners in the camps at Irene, Pietersburg, Middleburg, Standerton and Potchefstroom were still unreturned. The £3,000,000 granted in pursuance of the treaty of peace was duly distributed on the basis of evidence furnished by local commissions. Burghers of good financial standing, although strictly coming within the terms of the treaty provision, were excluded from participation in the grant. Considerable difficulty was experienced in executing that part of the tenth article of the terms of surrender which provided that certain notes issued by the Boer government and all receipts given by officers in the field would be accepted as evidence of war losses suffered by the persons to whom they were originally issued. In pursuance of this provision a commission was appointed to pass upon the character of the said notes and receipts presented. The government was astonished to find that claims for £90,000,000 were filed under this head.

The work of economic restoration was begun early in the year by the reopening of a number of the mines, and in July provision was made for surveying three new railroad routes. With a view to the preservation of breeding-stock an ordinance was issued prohibiting for two years the slaughter of cows, heifers and calves in the Transvaal. The resumption of industrial pursuits was greatly hampered by the difficulty of obtaining laborers. In August only 38,000 natives were at work in the Rand as against 98,000 before the war broke out. It was estimated that from 70,000

to 80,000 laborers were needed at this time. The scarcity of labor did not affect the mines only but also the railways, public works and agriculture. White labor could be obtained only at prohibitory wages and besides it was unskilled. Lord Kitchener suggested the employment of disbanded volunteers, but on account of the strong prejudices against having white and black men work together, the suggestion was impracticable. Lord Harris advocated the importation of Chinese labor until the mines could be gotten into full operation, but, apart from the national opposition to Chinese labor, its employment as a temporary expedient would retard the eventual employment of the native population in the mines. Meanwhile resort was had to the employment of white labor—an experiment that is being watched with interest. So far as any judgment has been formed the experiment promises favorable results, and the conviction is growing that it is in this direction that the deficiency of native labor must be remedied.

An administrative measure of importance was the issue of a liquor ordinance to go in effect November 25 and providing for the application of local option or dispensary system. The employment of females, children under sixteen years of age and natives in bar rooms is prohibited. Provision is also made for liquor traffic inspection, and stringent restrictions are placed upon natives engaging in the liquor traffic. Side and back doors as well as screens are prohibited.

In September a royal commission of ten members was appointed to inquire into the military preparation for the war in South Africa, the supply of men, ammunition, equipment, transportation by sea and land in connection with the campaign and into the military operations up to the occupation of Pretoria. It held its first session in London on October 7 under the presidency of Lord Elgin.

TRINIDAD and TOBAGO, the two most southerly islands of the West Indies, constitute a British crown colony. Trinidad, lying a short distance off the Venezuelan coast, has an area of 1754 square miles and a population (1901) of 277,651. Tobago, with an area of 114 square miles, has a population of 18,751. The seat of the colonial government is at Port of Spain, Trinidad, which has a population of 55,000, and the finest harbor in the West Indies. There is a well-organized school system, supported partly by government grant, and two colleges. The government is vested in a governor (Sir C. A. Malony) and executive and legislative councils. The revenue in 1901 amounted to £712,394, and the expenditure £731,160. The public debt is £992,286, largely representing the railway and other public works. The trade and commerce of the colony is in a prosperous condition, and is the largest in the British West Indies. The imports in 1901 amounted to £2,651,600 and the exports to £2,445,651. The principal exports are sugar (45,254 tons), rum (178,151 gallons), molasses (482,762 gallons), bitters (32,614 gallons), and cocoa (30,154,768 pounds). The export of asphalt from the remarkable asphalt lake near La Brea, Trinidad, amounted, in 1901, to 144,000 tons, valued at £159,044. There are 89 miles of railway in operation, and more under construction.

TRIPLE ALLIANCE. Perhaps the most important event of European international politics during 1902 was the semi-official announcement made on June 28 that a convention prolonging the Triple Alliance for a period of seven years and without alteration in form had been signed in Berlin by the German chancellor, Count von Bülow, and by the Austro-Hungarian and Italian ambassadors, M. de Szágyény-Marich and Count Lanza di Busca. The Triple Alliance was originally concluded in 1882 and was renewed for a period of twelve years on May 6, 1891. It had its origin in the treaty between Germany and Austria concluded in 1879, the terms of which were subsequently published. This alliance was directed against Russia, whose Balkan policy was believed to be a menace to the European balance of power. The occupation of Tunis by France in 1881 and the isolation of Italy induced the latter power to join the alliance in 1882, the three powers agreeing to defend their possessions against the encroachments of France and Russia. In 1896 Roumania joined the alliance, which guaranteed her territorial integrity and the maintenance of the *status quo* on the Danube. In October, 1887, at a meeting between Bismarck and Crispi at Friedrichsruhe, a closer alliance in the form of an offensive and defensive league was concluded, it being understood that in the event of war between France and Germany, Italy would invade France with 200,000 men. The terms of the Triple Alliance, however, have never been published, and it is stated on good authority that Count von Bülow has once more requested the allies to maintain this secrecy, and that assurances in this respect have been exchanged. But it is well known that the provisions of the treaty are mainly defensive and relate to military matters in the event of war in which any of the parties is a participant. It is asserted that the renewed alliance is based on the original agreement which obligated each party to maintain a certain military strength, but Chancellor von Bülow publicly declared that "none of the parties to the alliance is obliged to maintain its military or naval forces at a prescribed

level," and that the alliance does not exclude the possibility of friendly relations between its partners and other powers. As a matter of fact, Italy and France had already reached a full and complete understanding in regard to their interests in the Mediterranean (see ITALY), and this *rapprochement* had been definitely and publicly announced. It was quite generally believed that this fact, together with the growing dissatisfaction of Italy with the commercial treaties between her and the allies, which were soon to expire (at the end of 1903), would influence her action in considering the question of renewal, and that she might decline to give her adherence to the pact. This, however, proved not to be the case, although Signor Prinetti, the Italian foreign minister, admitted that the *rapprochement* with France had deprived some of the considerations which originally induced the alliance, of much of their weight. Moreover, the increasingly cordial relations between Austria-Hungary and Russia in regard to the Balkans, and the difficulty of settling the question of the commercial treaties between Germany and Austria-Hungary, it was believed, would retard the adherence of the latter to the alliance. The demand of the Agrarians in the German Reichstag that the duties on imports be increased, it was well known, could only affect Austria-Hungary and Italy unfavorably. When the projected tariff law, therefore, was published, it was semi-officially announced that Austria-Hungary would refuse to conclude any treaties of commerce with Germany on such a basis, and if necessary would sacrifice the Triple Alliance. It was understood, however, that they received satisfactory assurances in regard to the renewal of the commercial treaties, and therefore consented to the renewal of the alliance. For the maintenance of a safe balance of power and in the interest of the general peace, the contracting governments were probably influenced in some degree by the reaffirmation of the Franco-Russian alliance, but in greater degree, doubtless, by the fact that there was nothing else to do; without the Triple Alliance the isolation of Germany would be practically complete and the antagonism between Italy and Austria-Hungary could hardly fail of being revived or the growing friendliness of Italy and France of being accelerated.

TRIPOLI, a vilayet of the Ottoman Empire, between Tunis and Egypt, has an estimated area, together with Benghazi, of 398,900 square miles and an estimated population of 1,300,000. Revenue and expenditure for the fiscal year 1901-02 are stated at £142,056 and £170,424, respectively. Imports and exports in 1900 were valued at £499,500 and £418,500, respectively; in 1901, £364,000 and £326,500, respectively. The leading exports are esparto grass, tanned skins, ostrich feathers, and sponges. Reports in 1902 showed a serious decline in commerce. It not only appeared that the country produces little of export value, but that internal troubles had stopped the caravan trade with Wadai and the western Soudan. In the spring of 1902 the Turkish government issued an edict prohibiting foreign vessels from fishing in Tripolitan waters. This edict, which was probably directed against the Italians, affected more considerably the Greeks, who carried on most of the sponge-fishing in these waters.

During the spring of 1902 friction was occasioned by an effort to enforce a conscription law among the Arabs and to levy a new land and property tax. The conscription law, which should have gone into effect on March 14, the beginning of the Turkish fiscal year, was left in abeyance on account of the hostile attitude of the Arabs, but the appraising of land under the new taxation law was carried out. The alleged "understanding" between France and Italy, allowing the latter freedom in gaining control over Tripoli, continued in 1902 to be regarded by the press as an accomplished fact. It seemed, however, that Italy's ambition to acquire, or at least to establish a protectorate over Tripoli, would have to meet not only the opposition of the Sultan, but the resistance of the followers of the new mahdi, the Sheikh Senussi, who had a base of communications at the port of Benghazi. In April it was reported that a Turkish garrison had pushed far into the French Sahara and occupied Bilma, a town on the caravan route between Tripoli and Lake Tchad. The solution of the Senussi problem, which is still pressing, although the sheikh himself died in 1902, is involved in the settlement of Tripoli. Any attempt to stop the importation of arms and ammunition through Benghazi would probably bring about a revolt of the desert fanatics. See FRENCH SOUDAN.

Mr. C. H. Allen, of the Anti-Slavery Society (British), stated in the spring of 1902 that there has long been a constant though well concealed slave trade from Tripoli to Constantinople and ports in Asia Minor; and he would welcome such an increase of Italian influence in the country as would put an end to the traffic.

TRUST AND LOAN COMPANIES. The following table giving statistics of trust and loan companies for the fiscal year 1901-02, is based on reports made to the comptroller of the currency, approximately on June 30 of each year.

LOAN AND TRUST COMPANIES

STATES.	Number of Companies.		Deposits.		Total Resources.	
	1901	1902	1901	1902	1901	1902
Maine.....	17	18	\$11,091,434	\$16,528,147	\$14,653,508	\$12,577,500

TRUSTS. *Political Discussion.*—Both the great political parties in the United States made the trust question the principal issue in the autumn campaign of 1902, but the Republicans generally insisted that the tariff was an issue entirely apart from the trust issue, while the Democrats insisted that the proper mode of regulating the trusts was through revision of the tariff on free-trade lines. They attempted to make the campaign a free-trade campaign, as was done in 1888 and 1892. They emphasized strongly the lower export prices given by American manufacturers. According to computations made by the Democratic congressional campaign committee the prices in the home market were from 20 to 26 per cent. higher than prices given to exporters. The most flagrant example of tariff protection was in the case of the borax trust. Other instances were afforded by the export trade in typewriters, wire rope, and cartridges.

Frequently goods were shipped to a foreign free port, and reshipped to the United States, so that after paying freight both ways, besides the tariff, they were resold more profitably than goods bought directly for the home trade. Trade with Porto Rico and Hawaii was much disturbed after 1900, because of doubts whether the islands were foreign or domestic territory.

The Democratic campaign speakers insisted that the selling abroad more cheaply than at home indicated that the manufacturers of the United States no longer needed protection from foreign competition and, furthermore, that the retention of the present high rates of duty gives the trusts the opportunity to levy exorbitant prices upon consumers at home, because of the fact that foreign producers were excluded from our markets. The testimony of Mr. Henry W. Havemeyer and of Mr. Charles M. Schwab before the Industrial Commission was made much of. Mr. Havemeyer had said the mother of all the trusts is the protective tariff and Mr. Schwab had admitted that export prices are regularly lower than home prices. The Republicans met the allegations of the Democrats by saying that the lower export prices were necessary in order to secure foreign markets. They attempted to show that by a removal of the protective tariff, industry might be very seriously injured; they held that our manufacturers were not able to compete with foreign manufacturers, notwithstanding the fact that they were by means of protection enabled to invade the foreign market, actually selling below their cost of production. They were enabled to do this because they had the home market protected. It was asserted that lower prices to foreigners were perfectly legitimate, and that the domestic consumer secured his commodities more cheaply, because protection enabled industry to be organized on a large scale, thus introducing great economies in production, which would be lost by removing protection. Removal of tariff protection would thus result in the loss of the foreign market and a consequent increase instead of a decrease in domestic prices.

The United States Steel Corporation was cited by a number of economic writers as an instance of the unfair workings of protection. In the first place it was said that its formation stock had been watered up to at least one-half of its total capitalization, and that then the plea was made that the company's duty to investors re-

quired payment on all dividends, which payment was made possible only by the maintenance of the tariff. The testimony and statements of Mr. Schwab were quoted to the effect that steel rails could be sold at a profit of \$16.50 a ton, and that they were exported by the trust for \$23 a ton, while sold here at \$26 to \$28 a ton. It was estimated by some of these writers that as a result of this system the trust has made three times the profit which it could have made without tariff protection, and has in this way been able to sustain its enormous capitalization.

President Roosevelt declared in favor of trust regulation, advocating (1) publicity and (2) an amendment to the United States Constitution, providing for national incorporation and congressional regulation of the trusts. Later he strongly advocated the establishment of a permanent tariff commission to examine into conditions and recommend needed changes to Congress. As to the removal of the tariff from trust-made articles he said in his Cincinnati speech of September 20: "A remedy much advocated at the moment is to take off the tariff from all articles which are made by trusts. To do this it will be necessary first to define trusts. The language commonly used by the advocates of this method implies that they mean all articles made by large corporations, and that the changes in the tariff are to be made with punitive intent toward those large corporations. Of course, if the tariff is to be changed in order to punish them, it should be changed so as to punish those that do ill, not merely those that are prosperous." He went on to say that in rearranging tariff schedules affecting big corporations, it would be necessary to consider the interests of the smaller competitors, which, being weaker, would suffer most by removal of protective duties. Moreover, it would be necessary to consider the interests of the workmen employed by the trusts. The products of many trusts are unprotected, and would be entirely unaffected by any changes in the tariff. "The Standard Oil Company offers a case in point; and the corporations which control the anthracite coal output offer another—for there is no duty whatever on anthracite coal" (sic). Without entering into the discussion of the relative merits of protection, free trade, and reciprocity, Mr. Roosevelt concluded "that the real evils connected with the trusts cannot be reached by any change in the tariff laws."

Attorney-General Knox in an address before the Chamber of Commerce of Pittsburg, Pa., October 14, proposed as remedies that all corporations doing business outside the State chartering them should be required to observe the provisions of their charter in all the States; that public carriers should be compelled to treat all patrons alike; that corporations controlling the necessities of life should be compelled to conduct their business so as regularly and reasonably to supply the public needs; and that they should be subjected to supervision and publicity.

One of the recommendations made by the United States Industrial Commission in its report was for the imposition of a tax upon corporations or individuals engaged in interstate commerce, thereby securing a supervisory control over such industries. Professor Jenks thinks that such a franchise or license tax would be clearly constitutional and would give the Federal government all necessary supervision and control of trusts. Another plan also suggested by the Industrial Commission and since emphatically advocated by Mr. James B. Dill, of New York, and Mr. J. S. Auerbach, is the federal incorporation of corporations engaged in interstate commerce. Some doubt exists as to the constitutionality of such a measure, and if Congress enacted a federal corporation law it would be evaded unless its provisions were so lenient as to be of no utility in regulating the trusts.

The attitude of the Republicans of the Northwest is indicated by the platforms of the Idaho and Iowa Republicans. The Idaho convention met first and declared: "That many of the industries of this country have outgrown the need of protective tariff is made evident by the fact that the American manufacturer has entered the markets of the world and is successfully competing with the manufacturers of all other countries. Many of the tariff schedules adopted to foster infant industries have fully served that purpose and have now become a means of aiding and building up powerful trusts and combinations, and enable these to exact from the American purchaser the payment of higher prices than they exact for the same class of goods sold in foreign countries. We therefore favor a revision of the tariff without unreasonable delay, which will place upon the free list every article and product controlled by any monopoly and such other articles and products as are beyond the need of protection. The formation of enormous over-capitalized corporations, commonly called trusts, for the purpose of concentrating all the industries and products of the country in the hands of a few men, stifling competition and enabling them to dictate the wages of labor, and the prices of commodities to both the purchaser and consumer in the interests of their own aggrandizement, is a great and growing evil, the plain remedy for which should be laws regulating the capitalization of corporations within reasonable and moderate limits."

The Iowa Republicans declared: "We stand by the historic policy of the Republican party in giving protection to home industries, and point for its ample vindication to the extraordinary rapidity with which our national resources have been developed and our industrial and financial independence secured. We favor such changes in the tariff from time to time as may become advisable from the progress of our industries and their changing relations to the countries of the world. We assert the sovereignty of the people over all corporations and aggregations of capital and the right residing in the people to enforce such regulations, restrictions, and prohibitions upon corporate management as will protect the individual and society."

In the New England States sentiment was strong for revision of the Dingley schedules in Eastern Massachusetts, Southern New Hampshire, and Rhode Island, while in Maine, Northern New Hampshire, Vermont, and Western Massachusetts a conservative sentiment for protection was dominant. The opinion expressed by revisionists was general that if the Republicans did not take action the Democrats would. The reason for opposition to tariff revision along the Canadian border was due to the fear of Canadian competition in the manufacture of paper and wood pulp. The independent iron manufacturers along the tidewater were strongly in favor of revision in the iron and steel schedules along lines advocated by Mr. Henry W. Lamb, of Boston. Mr. Eugene M. Foss was nominated in the eleventh district of Massachusetts as Republican candidate for Congress on the platform of free coal, free hides, free iron, and free steel; but was defeated, thus showing that the sentiment for freer trade is not universal.

Northern Securities Merger.—The Northern Pacific Railway Company and the Great Northern Railway Company, owning, respectively two lines of railroad extending from the cities of Duluth, St. Paul, and Minneapolis in the State of Minnesota, across the continent to Puget Sound, and generally no farther distant from each other than 100 miles, and practically the only competitors in the transportation of traffic to and from most of the States traversed by them, in 1901 combined and purchased about 98 per cent. of the entire capital stock of the Chicago, Burlington, and Quincy Railway Company. The amount of stock acquired had a par value of about \$107,000,000, and was purchased at the rate of \$200 per share, the bonded indebtedness of the two companies being thus increased by \$200,000,000. Thus these two trans-continental lines became the joint owners of another great system which was gradually pushing its rails northwesterly into the territory occupied by the purchasers and westwardly to the Pacific Ocean. Shortly after the purchase of the Burlington road the principal owners of the Northern Pacific and Great Northern roads caused to be organized, under the laws of New Jersey, the Northern Securities Company, with a nominal capital of \$400,000,000, of which \$40,000 was paid in. That company was organized to become the owner of the capital stock of the Northern Pacific and Great Northern railroad companies, and this was accomplished by an exchange of the stock of the New Jersey corporation for the stock of the two railroad companies at such price that, if the Securities Company got all the stock of both roads, its entire \$400,000,000 of capital would be absorbed in the exchange.

Shortly after its organization, the Northern Securities Company acquired a large majority of all the stock of the Northern Pacific Company at the rate of \$115 per share, paying therefor in its own stock at par. At the same time it acquired about 300,000 shares of stock of the Great Northern Company at the rate of \$180 per share, using its own stock at par to make the purchase. Other purchases of the Great Northern stock were subsequently made until about 96 per cent. of Northern Pacific stock and 76 per cent. of Great Northern stock was held by the Securities Company. Soon after, it was charged that the Northern Securities Company was not organized in good faith to purchase and pay for the stocks of the two railway companies; that it never had money enough to do so, and that the only consideration for the transfer to it of the shares of the two railway companies was the issuing and delivery of its own shares in exchange therefor. Three actions were accordingly brought in the United States courts to test the legality of the company: one on the part of the United States by Attorney-General Knox; one by the State of Washington; and one by the State of Minnesota (*q.v.*). The Washington case was argued before the United States Supreme Court and decision was reserved. The case brought by Attorney-General Knox was originally brought in the United States Circuit Court of Minnesota, but by a special act of Congress was taken to the Circuit Court of Appeals, where it was pending at the close of 1902.

Beef Trust.—The remarkable advance in the price of meats, coupled with the disclosures elicited by the commission respecting secret rebates enjoyed by the great packing houses, and other information obtained by the Department of Justice, induced it to direct an investigation into the methods of the so-called "Beef Trust," as a result of which bills were filed under the Sherman Anti-Trust Law, and injunc-

tions issued restraining each of the six defendant concerns from combining, or agreeing upon the prices at which they would sell their products in States other than those where they are prepared for market, and also restraining them from combining and agreeing upon cartage charges for delivering their shipments at destination. Under the rules of the Federal courts, after the writs of injunction were issued, the defendants had until midsummer to answer or demur to the government's bill of complaint. They chose to demur to the bill, which raises the question whether, on the facts stated, and under the Constitution and existing laws, they are amenable to the control of the Federal government.

Amalgamated Association.—For several months negotiations were carried on between the tin-plate workers of the Amalgamated Association and the American Tin-Plate Company and the United States Steel Corporation for a 25 per cent. reduction in labor in the manufacture of tin plates for export. Hitherto the plates used in cans for exporting mineral oils had been imported, a drawback being allowed when the cans were exported. After much discussion the tin workers voted that 3 per cent. of all their wages should be converted into a trust fund, the company being allowed to draw on such a part of it as would compensate them for loss incurred in making the plates at their works, instead of importing them. But the manufacturers undertook not to contract for more export business than this 3 per cent. would cover. In other words, there was not to be more than one box for export to about seven boxes for the domestic trade.

Illinois Anti-Trust Law.—In a decision of far-reaching importance the United States Supreme Court in the case of *Connolly vs. the Union Sewer Pipe Company*, affirmed the decision on March 10 of the Circuit Court, declaring the Illinois anti-trust act of June 20, 1893, to be in violation of the 14th amendment to the Constitution and void and illegal *in toto*. The Illinois statute defined a trust as a combination organized for any or all of the following things: To restrict trade; to limit production; to increase or reduce prices; to prevent competition in manufacture, transportation or sale; to fix a standard or control rate of prices, and to enter contracts or pooling arrangements for the execution of any of these purposes. The operation of a trust as thus defined was declared to be a criminal act, and such corporations, if foreign (*i.e.* chartered outside the State), were to be excluded from doing business in the State, and if domestic (State), were to be deprived of their charters. But a sweeping clause exempted agricultural products and live stock in the hands of the producer or raiser. The court held that this clause clearly constituted class legislation in violation of the 14th amendment, which provides that "no State shall . . . deny any person within its jurisdiction the equal protection of the laws." The court stated that this amendment had frequently been construed by it to mean that no State should deny any person the protection of equal laws; that the attempted justification of the law in that it made proper classifications for the good of the State and under the general police powers of the State, could not be sustained when, as in this case, such classifications were obviously arbitrary and when they moreover clearly violated the terms of the Constitution.

Clauses exempting agriculturists or labor unions, or both, have been inserted in the anti-trust laws of nearly all States attempting such legislation. These clauses have been inserted partly from necessity, and the knowledge that no stringent anti-trust laws could otherwise be passed, and partly from the feeling that from the nature of the fundamental difference in power between combinations of laborers or agriculturists and of combinations of companies, laws which should apply with equal severity to both would be unequitable as an economic proposition. Such exemptive clauses have been incorporated in the anti-trust laws of Georgia, Indiana, Louisiana, Michigan, Mississippi, Montana, Nebraska, North Carolina, South Dakota, Tennessee, Texas, and Wisconsin; and by implication the anti-trust statutes of these States are all declared illegal. The decision gains further importance from the fact that repeated attempts have been made in Congress when it was proposed to enact an anti-trust amendment to incorporate therein virtually the same exempting clause. See SHIPPING MERGER and UNITED STATES STEEL CORPORATION.

TUBERCULIN. See the following article.

TUBERCULOSIS. The tuberculosis problem continues to occupy a prominent place in the minds of sanitarians all over the civilized world. The mortality from this disease is rather increasing than diminishing. Pathologists are endeavoring to solve the problem by serum treatment; sanatoriums by segregating the tuberculous in country localities; and clinicians are vaunting various new drugs. The international tuberculosis congress for 1902 met at Berlin. The house-to-house fight against tuberculosis in France was described by Dr. Chalmette of Lille. This consists in the sanitary education of the poor done mostly by intelligent workmen, instructed for the purpose, who explain how to make a house healthy, and to

disinfect linen, and in addition supply material relief during the patient's enforced idleness. The congress spent one day in studying the great public sanatorium at Belzig, near Potsdam. The buildings of this institution cost \$2,500,000, and will accommodate 600 persons, one-half of whom suffer from tuberculosis, the other half from chronic diseases of the nerves, heart, or kidneys. The cases are all ambulant, and the maximum stay at the hospital is limited to 14 weeks. Dr. Rémond, of Metz, describes the methods of antitubercular treatment in and near Berlin. The Berlin polyclinic treats over 6000 out-patients annually, sending some to sanatoriums, the others being educated hygienically and given appropriate medicines. Summer colonies have been started at Grunewald and Jungferheide, near Berlin. Patients make daily trips thither during the summer months, and are supplied with plain meals and milk. It is estimated that there are accommodations for 20,000 sanatorium patients in Germany. Prizes have been offered, amounting to \$4000, by the committee appointed by the king of England for the best description of a complete sanatorium for tuberculous patients, the sanatorium to accommodate 100 patients. As a result of a recent conference held at Ottawa by the Canadian Association for the Prevention of Tuberculosis, it is announced that two new sanatoriums will shortly be built near Ottawa and Montreal. In the United States the number of sanatoriums has greatly multiplied during 1902. Many States have institutions for the treatment of tuberculosis. The Massachusetts institution claims that its percentage of cures has increased one-third in three years. New York has appropriated \$150,000 for the erection of a State sanatorium in the Adirondacks near Saranac Lake. Vermont is considering the erection of a similar institution, and Pennsylvania has appropriated \$100,000 for the same purpose. New Jersey is to have a State sanatorium at High Bridge, \$50,000 having been appropriated for the purpose. The Charity Organization Society of New York City has undertaken to fight the disease systematically through research into its social features, through education by the publication of pamphlets and the giving of lectures, by encouraging movements for suitable public and private sanatoriums, and by taking care of indigent consumptives. According to Dr. Sidney R. Hodge, tuberculosis is a very common and fatal disease in Hankow, China, and vicinity. Overcrowding, bad ventilation, poor living, and a hard life are the chief causes of the spread of the disease. The Chinese have an ingrained prejudice against fresh air. All varieties of tubercular infection abound. The only treatment used by the Chinese is giving opium.

The early diagnosis of tuberculosis by blood serum agglutination of the tubercle bacilli has been tested by Dr. E. Romberg of Germany, Dr. A. Ilventa of Italy, and others. Romberg's technique is as follows: A dry culture of tubercle bacilli is thoroughly triturated and emulsified, and to one liter of the emulsion 5 gm. of carbolic acid is added; this is diluted 1 part to 3 of distilled water, and serum extracted by wet cups is added in proportion of 1 part to 5, 10, 15, etc. The reaction is completed in test tubes and considered positive when the solution becomes clear in 44 hours. Altogether the reaction was tested in 256 individuals with the following results: In 33 new-born children, that is, in the blood extracted from the placenta, no reaction occurred. In 102 persons over 14 years of age, without clinical signs of tuberculosis, the reaction was positive in 64 and negative in 58. Forty-three positive cases agglutinated only in proportions of 1 to 5 and stronger, and 18 of the remainder in dilutions of 1 to 10. The method as at present undeveloped is therefore very unreliable. Tuberculin has also been widely used both as a means of diagnosis and cure of phthisis. This is given in doses of .005 gm., increased when necessary to .010 gm. In the presence of tuberculosis a characteristic reaction takes place, typically at the eighteenth hour after injection. There is a rise of at least two degrees of temperature, accompanied by chilly feelings, headache, nausea, and muscular pains. As a specific treatment many observers regard tuberculin as superior to any other. Robert Williams, in the belief that goats' milk can cure tuberculosis, is establishing an immense goat camp in the Migollin mountains near Phoenix, Ariz. Williams regained his own health on a constant diet of goats' milk. His treatment provides a pint of milk with bread morning and night, with a half pint at intervals of two hours during the day. He wants the government to undertake the matter, averring that it could establish in the mountains of northern Arizona a series of sanatoriums capable of accommodating 10,000 patients, and pay expenses out of the profits on hides, wool, and meats. See CHARITY ORGANIZATION.

TUNIS, a French protectorate in North Africa, on the Mediterranean Sea between Tripoli and Algeria, has an area of about 51,000 square miles and a population of 1,900,000, largely Bedouin Arabs and Kabyles. The French civilian population numbered in 1901 24,204, and there is a Jewish population of 60,000. Tunis, the capital, has a population of 170,000, of whom 40,000 are Europeans. The administration, nominally in the hands of a native bey, is in reality under the control of a French resident-general acting under direction of the French foreign office. There

are two military circles and thirteen civil districts under French *contrôleurs*, assisted by native subordinates. French tribunals administer justice in all cases in which Europeans are concerned. The French military forces number about 15,000. For 1901 the revenue amounted to 39,237,154 francs and the expenditure to 39,122,435 francs. The budget estimates for 1902 placed the revenue and expenditure at 54,113,963 francs and 54,026,154 francs, respectively. Agriculture is the chief industry. Among the more important products are wheat, barley, oats, olives, dates, wine, fruits, nuts, alfa grass, and cork. Iron, lead, and zinc are mined, and the quarries are valuable. The imports in 1901 were valued at 64,680,000 francs and the exports at 39,130,000 francs, which was an increase in imports and a decrease in exports compared with 1900. There are 588 miles of railway in operation, of which 417 miles belong to the state.

History—Sidi Ali (*q.v.*) Bey of Tunis, died June 11, 1902, and was succeeded by his son Mohammed el Hadi Pasha, who was born in 1855. Early in the year the French parliament authorized a Tunisian loan of 40,000,000 francs for the construction of 1000 kilometres of new railway lines. In October it was announced that the French government would soon begin laying a telegraph cable across the Sahara Desert from Tunis to Lake Tchad. French activity in fortifying and establishing a strong naval base at Bizerta during 1902 was frequently commented upon in the European press. The port, which possesses one of the best harbors on the Mediterranean, is being more impregnably fortified than Malta, than which place, naval authorities say, it is much more important strategically. During the early months of the year a plague of locusts did much damage to crops in the interior, but the Arabs have learned from experience that the grain-fed locusts are about as nourishing as the grain itself. The government has established free salt depots throughout the country, in order that the nomadic tribesmen may receive salt with which the locusts may be made more edible.

TUNNELS. In the building of tunnels the record for the year 1902 naturally begins with a statement of the progress of work on the tunnel under the Simplon Pass of the Alps, which has now been in process of construction for several years, and which when completed will be the longest tunnel in the world. The Simplon tunnel is the fifth tunnel of the Alps, and it compares with the other Alpine tunnels in length and elevation as follows (the first figure representing length in miles and second elevation in feet): Mont Cenis, 7.5 and 4298; Arlberg, 6.25 and 4300; St. Gothard, 9.75 and 3788; Albula, 4 and 6000; Simplon, 12.4 and 2310. The Simplon Pass occupies a position about midway between the Mont Cenis and the St. Gothard. The tunnel when completed will bring Brindisi, the dispatch port for the Indian mails, within 1400 miles of London, or 180 miles nearer than at present. Work is in progress on the tunnel from both ends, where large power houses and working plants have been installed. At the north, or Swiss, end, the only difficulty encountered has been due to subterranean heat, which has reached 53° C. and necessitated the employment of artificial refrigeration. At the Italian end there has been trouble with soft material and with water coming from the fissures of the rock. This flow of water was 34½ cubic feet per second during November, 1902. The latest official reports of progress are dated December 1, 1902, and show that the heading from the north end had progressed 27,096 feet, and from the south end 18,739 feet, making the aggregate length of heading excavated 45,835 feet. To connect with the Italian end of the tunnel a railway is being built from Domo d'Ossola to Iselle. This line has several tunnels, the longest of which is built on a spiral, like one turn of a spiral spring, and is 9842 feet long. Plans have also been completed for a five-mile tunnel through the Jura mountains to give French railways a shorter route to the Simplon tunnel by a cut-off connecting Dijon and Geneva.

The Albula tunnel, four miles long, was practically completed during 1902. Another foreign tunnel of note completed during 1902 is the Meudon tunnel on the Paris-Versailles line. This tunnel, which is 10,990 feet long, passes through marl, which gave immense trouble in excavation. The methods adopted in overcoming these difficulties furnish one of the most interesting exhibitions of engineering skill that recent years have chronicled. In Japan the Sasago tunnel, 4646 metres (15,243 feet) long, was also practically completed during 1902.

In the United States the year saw work resumed on the long abandoned Hudson River tunnel, and at the close of the year there was a fair prospect that this work would be completed. It was in 1874 that the first company was formed to build a tunnel from Fifteenth Street in Jersey City to Morton Street in New York City. A shaft was sunk 60 feet on the New Jersey side, and from its bottom twin tunnels were started toward the New York shore. The plan of construction adopted was to hold back the water by air pressure and to line the excavation with a cast-iron ring built up of segments inside of which was a ring of brick work. About 300 feet of the north tunnel had been completed, when in July, 1880,

a leak started near the shaft and the tunnel was flooded and 20 men drowned. The damage was repaired and work resumed and continued until the north tunnel had been completed 1550 feet and the south tunnel 570 feet. Lack of money then necessitated stopping the work. In 1890 an English company undertook the abandoned work and continued it, using the shield system until about 4000 feet of tunnel on the New Jersey side and 200 feet on the New York side had been completed. After this financial difficulties arose, and the work was again abandoned. In 1902 the New York and New Jersey Railroad Company bought the abandoned property and resumed work on the general plan of the English engineers. At the end of the year the new company had built about 240 feet more of the north tunnel. It is the intention of the new owners to use the tunnel for electric cars. During 1902 also the Pennsylvania Railroad secured its franchise for building the proposed tunnel from its lines in New Jersey under the Hudson River, Manhattan Island, and the East River to a connection with the lines of the Long Island Railroad system. No construction work was begun on this tunnel, but a construction organization was completed and much work done considering plans for the prosecution of the work.

In New York City proper, work was substantially advanced on the tunnels forming portions of the Rapid Transit Railway. There are four of these, which are of more than usual interest. The first of these is the double tunnel, about 1850 feet long, between Thirty-fourth Street and Forty-first Street on Park Avenue; the second is the Central Park tunnel, 3887 feet long; the third is the Washington Heights tunnel, 10,366 feet long; and the fourth is the Harlem River tunnel, some 1500 feet long. The last work is a subaqueous tunnel through soft ground, and the other three are solid rock tunnels. The extension of the Rapid Transit Railway to Brooklyn, the contract for which was let in 1902, also calls for a long tunnel under the East River.

In Boston the double track trolley car tunnel under the harbor to East Boston made successful progress during 1902. In Chicago the Illinois Telephone and Telegraph Company, which is building about 60 miles of deep tunnel for telephone wires, completed some 15 miles of its work during 1902.

TURKEY, or the OTTOMAN EMPIRE, an absolute monarchy in southeastern Europe, southwestern Asia and northeastern Africa. The capital is Constantinople.

Area and Population.—The estimated area is 1,115,046 square miles and the estimated population about 24,921,000. These figures are divided as follows: Turkey in Europe, 65,752 square miles and 6,086,300 inhabitants; Asia Minor, 194,389 and 9,355,000; Armenia and Kurdistan, 72,491 and 2,472,400; Mesopotamia, 100,205 and 1,350,300; Syria, 109,509 and 3,317,600; Arabia (only Hedjaz and Yemen), 173,700 and 1,050,000; Africa, 308,000 and 1,300,000. These figures do not include Bosnia-Herzegovina and Novibazar, Samos, Crete, Bulgaria and Egypt, whose aggregate estimated area is 464,936 square miles and population about 15,509,000. The population of Constantinople is stated at 1,125,000, Smyrna 201,000, Bagdad 145,000, Damascus 140,500.

Government, etc.—The supreme head of the government is the sultan, whose will in so far as it does not conflict with the precepts of the Koran is absolute. Under him legislative and executive authority is exercised in affairs temporal by the grand vizier and in affairs ecclesiastical by the Sheik-ul-Islam. Besides these there are executive officials in control of the several departments of government; together the ministers are known as the Sublime Porte, a name taken from the gateway of the building in which they meet. The sultan since 1876 has been Abdul Hamid II. Important ministers in 1902 were: Grand vizier, Kutchuk Said Pasha (appointed November 17, 1901); Sheik-ul-Islam, Jemalledin Effendi (appointed September, 1891); minister of the interior, Memduh Pasha; foreign affairs, Tewfik Pasha (appointed November, 1895); finance, Reshad Pasha; war, Riza Pasha.

The peace strength of the army is placed at 700,620; in actual service, however, there are about 10,000 officers and 170,000 men. In November, 1902, an iradé was issued authorizing the minister of war to contract with the firm of Krupp for 16 batteries, that is, 96 guns; the minister was also authorized to purchase 220,000 Mauser rifles of small calibre (7.5 mm.). These two orders require an expenditure of about £T900,000. The fleet is antiquated and of small practical value.

The monetary standard is gold and the unit of value the piastre, worth 4.4 cents. The Turkish pound is 100 piastres. Estimated revenue and expenditure for the fiscal year 1898 were £T18,511,322 and £T18,429,411, respectively; these figures do not differ greatly from the average revenue and expenditure (including supplementary credits) in the fiscal years 1893-95, which were £T18,927,745 and £T19,796,182, respectively. The debt (loans) on June 30, 1901, was £T133,939,003. In addition to loans Turkey still owes the greater part of the Russian war indemnity, amounting in 1898 to £T24,513,000. On July 12, 1902, a Russian note was laid before the Porte

claiming £T930,000 as compensation for delay in the payment of this indemnity. The claim in its entirety was disallowed by the Porte. In March, 1902, the sultan issued an iradé instructing the Porte to negotiate through M. Rouvier with British, French, and German syndicates for the unification of the debt, and on August 3 it was announced that M. Rouvier's plan had been adopted by the sultan unreservedly.

Commerce and Communications.—In the fiscal year 1897 imports and exports were valued at £T21,359,706 and £T15,428,458, respectively; in 1898, £T23,434,035 and £T14,744,498, respectively; in 1899 (the last year for which commercial statistics are available), £T26,621,250 and £T13,425,440, respectively. The leading imports are cotton goods and yarns, sugar, coffee, rice, woolen goods, petroleum, and flour. The most important exports include silk and cocoons, grapes, mohair, bones, valonia, and wheat. Imports from and exports to the countries of greatest commercial importance were valued in Turkish pounds as follows in the fiscal years 1898 and 1899:

	1898		1899	
	Imports from	Exports to	Imports from	Exports to
Great Britain.....	9,873,036	5,929,074	10,284,970	4,629,590
Austria-Hungary	4,603,630	1,369,218	5,231,310	1,202,350
France	2,424,180	4,330,394	2,474,030	4,208,970
Russia	1,668,623	429,220	1,751,620	468,300
Italy	990,667	485,850	1,386,950	540,740
Roumania	301,017	258,697	962,900	291,130
Bulgaria.	496,139	375,868	910,970	313,000

Trade with the United States during the fiscal year 1899 is stated at £T43,840 for imports and £T505,040 for exports.

Railway mileage is stated at 1267 miles in European Turkey and 1713 in Asiatic. There are about 23,440 miles of telegraph lines.

The Bagdad Railway.—The Anatolian Railway Company (largely a German corporation), which holds the concession for the projected Bagdad railway, owns the Anatolia Railway, extending from Haidar-Pasha on the Bosphorus, opposite Constantinople, to Angora (the main line, 358 miles) and to Konieh (a branch, 276 miles). The branch to Konieh leaves the main line at Eskishehr, midway between the Bosphorus and Angora. The Bagdad line is planned to extend from Konieh to the head of the Persian Gulf, a distance of about 2500 kilometres (1550 miles). In February, 1902, an imperial iradé was issued definitely granting the concession for a period of 99 years. According to this edict definite plans must be submitted to the government within a year and a half from the date of this concession, work must begin within the next three months, and the entire line be ready for operation within eight years. The annual government guarantee was fixed at 16,500 francs (\$3185) a kilometre (0.6214 mile), of which 4500 francs (\$869) is for working expenses. The concession stipulated that in case the kilometric receipts should exceed 16,500 francs, the surplus up to 22,000 francs (\$4246) should be paid to the government, and that 60 per cent. of any surplus over 22,000 francs should be paid to the government and 40 per cent. kept by the company. It is probable, however, that the receipts will not in a long time equal the kilometric guarantee. In this connection it may be pointed out that no Turkish railway of any considerable length, except in the neighborhood of Smyrna, is at present able to meet its expenses unaided by the government. The question of the kilometric guarantee presented the greatest difficulty in beginning the railway; and the concession of 1902 was not wholly reassuring, for the Turkish government had not been able to fix upon any particular source of revenue for meeting the guarantee. The railway will be a single track with a gauge of 1.44 metres, and will be built so as to allow the use of fast trains, covering the distance between the Bosphorus and Bagdad in 55 hours. At the time of the concession, in 1902, it was expected that the line would pass through Caramania, cross the Taurus Mountains and continue through Adana, Mersina, and Aleppo; thence it would run directly east to Mosul, follow the Tigris to Bagdad, and terminate at Basra, or better at the port of Koweyt (see ARABIA, paragraph Koweyt). Some discontent was manifest among the Germans, since the concession stipulated that the section from Mosul to Bagdad should pass along the right bank of the Tigris, a comparatively uninhabited district, instead of following, as was originally intended, the left bank, a country fertile, rich in minerals, and thickly populated. Later in the year the railway scheme seemed still less promising on account of the apparent abandonment of Koweyt as a possible terminus. The Germans blamed Great Britain for insisting upon the practical autonomy of Koweyt. Early in 1902 it was stated that the company purposed to offer 40 per cent. of its capital to French or Belgian subscribers and a like amount to Russians; but Russia

is not in favor of aiding a railway, an obvious purpose of which is to promote competition with her grain exports.

The Macedonian Troubles.—During the early part of the year the outbreaks against Turkish rule in Macedonia continued with substantially little change from 1901. The struggle was marked by occasional engagements between the revolutionists and detachments of Turkish troops, but in none of these was the loss of life very considerable. In the latter part of September the outbreaks became more general and more serious on account, it was said, of the enthusiasm aroused by the celebration in Bulgaria of the victory of Shipka Pass. The enthusiasm spread to Macedonia, causing the Bulgarian population to break out in a fresh uprising against Turkish misgovernment, and to meet it 40,000 Turkish troops were immediately mobilized. On September 24 it was reported that anarchy was rapidly spreading throughout Macedonia and that Bulgarian bands were directing their operations successfully against Turkish gendarmes. Two days later it was reported that 300 revolutionists, surrounded by Turkish troops in the district of Salonika, had cut their way through a cordon after a sanguinary fight in which both sides lost heavily and that troops were being dispatched rapidly to the interior of Macedonia. The renewal of the insurrection had been brought about chiefly through the activity of Colonel Zontcheff, an enthusiastic leader of the Macedonian Committee, who organized branch committees throughout Macedonia and directed the work of preparation and organization. A temporary setback was given to the revolt early in September by the arrest of Colonel Zontcheff and the seizure of the papers of the Macedonian Committee. The active leadership of the revolt was assumed by Colonel Jankoff, a former Bulgarian officer, who had at his disposal over 3000 men divided into several bands and operating in several districts. A provisional government was set up, telegraphic and railway communication was interrupted, and soon the whole province was reported to be in a state of siege. During the first week in October Colonel Jankoff issued a proclamation inviting all Bulgarians in Macedonia—a very large part of the population—to take up arms for the liberty of their country. He reminded them that other Balkan states had won their freedom by fire and blood, but urged his followers to abstain from injuring non-combatant Mussulmans. About October 12 the Porte sent an identical note to the Powers complaining that Bulgaria was inadequately policing her frontier, that she was permitting Macedonian bands to cross it, and that remnants of those bands after suffering defeat from the hands of Turkish troops were allowed to take refuge in Bulgaria. It was well known that the Bulgarian government was secretly in sympathy with the revolutionists and refused to interfere against them except when forced to do so by international public opinion. Thereupon the Bulgarian government addressed a note to the Powers denying the charges made by the Porte and asking that the cause of the revolution be removed by the introduction of reforms in the Turkish administration, without which the Bulgarian government could not restrain the revolutionary movement which was agitating the country. Earlier in the year several diplomatic remonstrances, particularly from Russia, had been made to the Porte, urging reform, but without success. In October Germany, and in November Great Britain and France joined Russia and Austria-Hungary, in representing to the Porte the necessity of introducing reforms into the Macedonian administration. Finally the Porte yielded and early in December decreed certain improvements with regard to public works, industry, and public instruction. Provision was also made for the reorganization of the gendarmerie from both Mussulmans and Christians, the appointment of civil tribunals consisting of an equal number of Christians and Mussulmans, and the investment of the valis with reasonable powers. The announcement of these reforms did not end the revolt, since it was said that the scheme of reforms merely repeated existing regulations which had been unenforced in the past and contained no feature to inspire hope and confidence in the future. Armed bands of insurgents on the one hand and Turkish troops and gendarmes on the other, with the usual incidents of semi-barbarous warfare, pillaged the country and burned the homes of the inhabitants. Hundreds of fugitive women, children, and old men fled to Bulgaria to escape the atrocities of the Turkish troops, and at the close of the year Macedonia seemed to be less pacified than ever. Near the end of 1902 the Russian minister of foreign affairs visited the courts of Servia, Bulgaria and Austria to secure the cooperation of those Powers in the preparation of measures necessary for the improvement of the condition of the Macedonian Christians and a scheme for presentation to the Powers was agreed upon.

Among the chief causes of complaint against the Turkish administration are the unjust fiscal system, a corrupt bureaucracy, the lack of justice and security, and the social subjection to the Ottomans which amounts to moral degradation. In the autumn the Macedonian Committee formulated their demands in a petition to the Bulgarian and Russian governments. These included the erection of Macedonia into a self-governing province with Salonika as its capital; a governor elected for a

term of five years; a provisional parliament elected by popular vote and empowered to discuss all questions of domestic concern; that the security of person and liberty of the press be guaranteed; that the local officials be chosen from the preponderant nationality in their respective districts and that the official language in each district, besides Turkish, be that chosen by a majority vote. One of the chief causes operating against the success of the revolutionary movement in Macedonia is the racial and religious antagonism. In northern Macedonia the population is largely Slav, being Bulgar in the east and Serb in the west, while in the southern part the people are almost purely Hellenic. Since the separation of the Bulgarian Church from the Greek Church in 1870, the religious antipathies of the people have divided them to a considerable extent. On account of the racial and religious diversity it is objected that a semi-independent principality would be a practical impossibility.

Firmilian.—The familiar charge that the Christian races of the Balkans have a greater antipathy for each other than for the Turks was illustrated in the spring of 1902 by the friction occasioned between the Serbs and the Bulgars in the vilayet of Kassova over the consecration of Mgr. Firmilian, a Serb, as the Greek patriarch's official metropolitan in Uskub. The Serbs held that Uskub is in their sphere and that hence the sultan should authorize the consecration of the Servian bishop, while on similar grounds the proposed action was as vigorously opposed by the Bulgars. The consecration of Mgr. Firmilian, which necessarily would wound the national vanity of Bulgaria, had been deferred since October, 1897, the date of his appointment, largely through the opposition of the Bulgarian exarch at Constantinople. The significance of the consecration was more than ecclesiastical, since the incumbency of the post at Uskub is an important factor in determining the preponderance of Bulgarian or of Servian influence in northern Macedonia, and so intense was the Bulgarian objection that rebellion was threatened. The sultan made the most of the conditions in his usual way of pitting Christian against Christian to gain time and quiet for the Turk. But Russia, fearing Bulgarian nationalistic and expansive ambitions, supported through her ambassador at Constantinople the Servian contention, which finally triumphed in the consecration of Mgr. Firmilian on June 28, 1902, in the Greek convent of Skaloti, near Enos, by the metropolitans of Lytitsa, Scio, and Vodena.

Release of Miss Stone.—Miss Ellen M. Stone, the American missionary who was captured by brigands in the Salonika district on September 3, 1901, was released with her companion, Mme. Tsilka, near Strumitza, on February 23, 1902. Though both had endured hardships in the way of fatiguing journeys with the brigands, neither had been subjected to ill-treatment, and at the time of their release both ladies, as well as Mme. Tsilka's infant daughter that had been born in captivity, were in good health. The amount of ransom originally demanded by the brigands was £T25,000 (\$110,000), but they received only \$72,000. Owing to the brigands' precarious position, several attempts to pay this indemnity resulted in failure, but the money was finally turned over on February 6. The opinion prevailed at the time, and there seems to be little reason to doubt its accuracy, that Miss Stone's captors were not professional brigands, but were Bulgarians or other supporters of the policies of the Macedonian Committee, and that the kidnapping was simply a political move to gain some addition to their means for an insurrection.

Albania.—During 1902 the inherent hostility existing between the Albanians and the Turkish authorities continued to manifest itself in popular disorders and disaffection, accompanied by the usual reprisals and outrages of the Turks, though conditions were not so bad as further to the eastward, where the irritating Bulgarian influence is strong. Various encounters between Albanian brigands and Turkish troops were reported, as well as conflicts between Albanians and inhabitants of other so-called Christian nationalities. Italy's desire to extend over the country her protection, perhaps sovereignty, is well known. The primary desire of the Albanians themselves, both in Ottoman territory and in Italy, is separation from Turkey, and in 1902 they were looking forward to the establishment of a self-governing state. The success of such a state is not enhanced by the fact that three claimants to the anticipated throne have appeared. These are Don Juan Aladro Castriot, a Spaniard; Marquis Auletta, or John Castriot Scanderbeg; and Baron Fossacena, or Philip Castriot. The two latter are Neapolitans; all allege descent from the Albanian hero George Castriot, better known as Scanderbeg.

Turkish-Persian Relations.—In August an understanding in the form of a preliminary treaty between Persia and Turkey was reached with regard to a customs arrangement on the basis of the most-favored-nation principle. The treaty provides for a 5 per cent. *ad valorem* duty on all Ottoman merchandise imported into Persia, while importations from Persia into Turkey will pay 8 per cent.

Lebanon.—The Syrian mutessarif of Lebanon (area about 2500 square miles, population variously estimated at from 200,000 to 400,000) must always have a

Christian governor, according to international agreement. After the ambassadors of the Powers in Constantinople had rejected, in August, 1902, the sixth candidate proposed by the Porte for the governorship of Lebanon, they nominated, on September 27, Muzaffer Pasha. The Turkish foreign minister, Tewfik Pasha, raised no objection and the protocol was signed. The new governor, who is described as able and upright, is of Polish origin, his real name being Tchaikowsky. He was promoted to field marshal in the Turkish army and was given the rank of vizier. The inhabitants of Lebanon are mostly Maronite and Greek Christians.

Foreign Clerics.—In the summer of 1902 France practically waived her traditional right, which up to that time had not been contested by the Turkish authorities, to protect all Roman Catholic clerics in the Levant. This change came about through the wrangle of Greek and Latin (mostly Italian) monks in Jerusalem in November, 1901. The Greeks, it appears, made an unwarranted attack upon the Latins, and France at the instance of Russia declined to demand their punishment. Italy and Germany, however, forced the case and secured the conviction of the offenders in a Turkish court (June 3), and the right to protect their respective clerical subjects was recognized. Through this affair France has in some degree lost prestige in the Levant.

Congress of Liberals.—A congress of 47 delegates representing Ottoman liberals of various nationalities, including the Turkish, Greek, Albanian and Armenian, was held in Paris early in February, 1902, under the leadership of Prince Sabah Eddin. While the members repudiated in general the régime of Abdul Hamid, they announced as their common aim the maintenance of Turkish territorial integrity, the re-establishment of order, and respect for the fundamental laws and for international treaties, especially the Treaty of Berlin, which they maintained should be applied throughout the empire. Against the vigorous protests of the minority, led by Ahmed Riza, a resolution was adopted appealing to the foreign Powers for their good offices in bringing about the needed reforms. This measure was opposed on the ground that such interference would encroach upon the independence of Turkey. In June, 1902, Prince Sabah Eddin, who is a son of Mahmud Pasha, was arrested by the Russian authorities at Tiflis, charged with attempting to organize an insurrection in Armenia. See ARCHEOLOGY, ARABIA, ARMENIA, BALKAN PENINSULA, BULGARIA, CRETE, CYPRUS, EGYPT, and TRIPOLI.

TURKISTAN, RUSSIAN. See CENTRAL ASIA, RUSSIAN.

TUSKEGEE NORMAL AND INDUSTRIAL INSTITUTE, Tuskegee, Ala., established in 1880 for the training of colored young men and women. The institute had in 1901-02, 112 officers and instructors and 1384 students. The income for the year was \$341,000, with gifts aggregating \$129,561. The library given by Mr. Andrew Carnegie was completed, and Rockefeller Hall, a men's dormitory, an office building, and two bathhouses were in process of construction. Among the gifts of the year were funds for the erection of the Collis P. Huntington memorial building, a dormitory for women, a memorial gate, to be known as the Lincoln gate, and several cottages for teachers. The growth of industrial training at the institute is shown by the fact that the students now receive instruction in 34 industries. Among the chief needs of the institute are an adequate endowment fund and funds for scholarships and for the erection of additional buildings.

UGANDA, a British protectorate in equatorial Africa, has an estimated area of about 120,000 square miles and a population of perhaps 3,000,000. The British resident commissioner since late in 1901 has been Lieut.-Col. J. Hayes Sadler. The native king, Daudi Chua, is a minor, under the regency of three native chiefs. The protectorate is regarded by the British as a territory of much promise. Christian missionary effort is meeting with remarkable success. During 1902 there were terrible ravages of the sleeping sickness, to which, in 1902, between 20,000 and 30,000 persons succumbed. The so-called Uganda Railway is wholly within the British East Africa Protectorate (*q.v.*). In 1902 Sir Harry H. Johnston, the former British commissioner, published a remarkably able and comprehensive work entitled *The Uganda Protectorate*.

UNITARIANS form a sect, the distinctive tenet of which is belief in the unity of the godhead, that originated in 1815 as a denomination of the United States. There are now 460 churches, 12 new churches having been added during the last year, and 548 ministers, an accession of 27, and an approximate membership of 71,000. The work of the church is carried on through the American Unitarian Association (see below), the Unitarian Sunday School Society, National Alliance of Unitarian and Other Christian Women, and the Young People's Religious Union, all of which maintain headquarters at 25 Beacon Street, Boston. Special committees of the association have been active during the year 1902 in investigating the condition of the country work, on retiring allowances for ministers, on the sources of the Unitarian ministry, on non-sectarian education, and on plans for new church build-

ings. The president and secretary of the association with several others have given an increased amount of attention to the work of visiting and encouraging the churches and of preparing the way for new churches. A representative has been maintained in Cuba for the circulation of Unitarian literature and for inquiry into the religious conditions of the island. The general fund of the association, including \$140,000 belonging to the church building loan fund, amounts to \$742,000, more than \$60,000 having been added this year. For denominational work during the year a sum exceeding \$100,000 was expended. The publication department of the church issued some 350,000 tracts, including 33 new titles; and a number of important new books were printed, among which was *Unitarianism in America*, a history of its origin and development, by George Willis Cooke.

American Unitarian Association, the executive organization of the church, conducting particularly its missionary activities, was founded in 1825. It maintains subordinate offices in New York City and in San Francisco, the building in Boston that serves as its headquarters being valued at \$200,000. Annual conventions in May are held in Boston. President, Rev. Samuel A. Eliot, D.D.; secretary, Rev. Charles E. St. John, 25 Beacon Street, Boston, Mass.

UNITED BRETHREN IN CHRIST, instituted as a church in 1800, though the denomination really dates from 1766. Including the membership of the radical body (old constitution), which was established in 1889 by opponents of the revised constitution adopted by the majority, the United Brethren now number some 275,000, the larger body having 249,314 communicants, a gain of 4647 for the year, with 2401 ministers and 4034 churches, the property of which is valued at \$7,010,104. The contributions for all purposes aggregated \$1,661,524, of which \$92,733 were received for missions. During the year 1902 the debt of \$29,000 on Union Biblical Seminary, the theological school of the church, was raised and \$82,000 were secured for Otterbein University, the oldest college of the denomination, besides large sums for other educational institutions. One of the most notable educational advances of 1902 was that achieved in the consolidation of the church school in Kansas, Lane University, with Campbell University at Holton. This transfer brings to the church new property and endowment amounting to \$185,000, whereby the consolidated institution, after June, 1903, to be known as Campbell College, will become one of the best equipped in the denomination. During the year two new missionaries were sent to Africa and two to China, and a plan of joint superintendence for the missions in Africa under the Woman's Board and the General Board of the church, was agreed upon. The United Brethren lost by death Bishop James William Hott, D.D., LL.D. (*q.v.*), who had been a leader in the denomination for nearly thirty years. The other bishops chose as his successor the Rev. George M. Mathews, D.D., of Dayton, O. A significant movement was begun in 1902 in the interest of federation between the United Brethren Church and several other smaller religious bodies in the United States. A memorial was addressed by a number of prominent ministers and laymen to the bishops of the church asking them "to take such steps as are necessary to open negotiations with churches similar in polity and doctrine, looking toward permanent union," and naming "especially the Methodist Protestant, Evangelical, United Evangelical, and Cumberland Presbyterian churches." The leaders of the church favor the union proposed, and it is believed that a practical basis for uniting some of these bodies will be reached. See METHODIST PROTESTANT CHURCH and CUMBERLAND PRESBYTERIAN CHURCH.

UNITED EVANGELICAL CHURCH dates from 1891, having originated in the division of the Evangelical Association (*q.v.*) that arose owing to the disputes of rival conferences. The general conference of the church, which holds quadrennial sessions, met in October, 1902 in Williamsport, Pa. Reports from the various denominational activities were heard, none of greater interest than that of the foreign missionary work which has been recently begun in China, centering around the capital of Hunan. The Rev. H. B. Hartzler, D.D., of Harrisburg, and Rev. W. F. Heil, of Allentown, were chosen as bishops for the next four years. In 1906 the general conference will be held in Cedar Rapids, Ia. The United Evangelical Church has a publishing house in Harrisburg, Pa., and is represented by the *Evangelical*. Under its auspices are three educational institutions. During the year 1902 Central Pennsylvania and Albright colleges for greater efficiency were consolidated under the name Albright College. There were, in 1902, ten conferences in the denomination, which is strongest in Pennsylvania, where more than two-thirds of its constituency is found, comprising 63,390 members, a gain of 867 over last year; 501 ministers and 214 local preachers, and 979 organized congregations, 820 of which possess church edifices. The value of all church property aggregates \$2,749,408. Contributions for missions were \$71,181; for the construction and repair of churches and parsonages, \$117,167. The Sunday schools number 887, and are

attended by 11,349 officers and teachers, and 83,381 scholars. The United Evangelical Church was one of the denominations named in the movement for federation that originated among members of the United Brethren in Christ (*q.v.*).

UNITED PRESBYTERIAN CHURCH OF NORTH AMERICA was established in 1858 by a union of Associate and Associate Reformed elements. It now has a total membership of 132,476, including 117,874 in America, a gain over 1901 of more than 2000 for the whole church and of less than 1000 for America. There are 1026 ministers, 88 licentiates, and 67 theological students; 995 congregations, 955 of which possess church buildings, and 370, parsonages. The total value of denominational property—educational institutions, not including those in India and Egypt, churches, and parsonages—is about \$9,750,000. A substantial gain was made in the last year in the amount of contributions for all purposes, the aggregate being \$1,874,514, as against \$1,751,291 for 1901. The Sunday schools number 1226, having 13,498 officers and teachers, and 120,133 scholars. The United Presbyterian Church comprises 13 synods and 68 presbyteries. Under the auspices of the denomination are two theological seminaries in America, one in India, and one in Egypt; six colleges, including an institution, in Knoxville, Tenn., for colored students, and in Egypt and India, one each. The foreign mission work is carried on through 637 stations, 24 new stations having been organized last year. The church is represented by the *United Presbyterian*, its publishing interests comprising four weekly papers, a missionary magazine, and three papers for Sunday schools and Young People's societies. The publishing house is in Pittsburg, Pa. In 1902 the general assembly met in Allegheny, Pa., beginning May 28; its next session will convene in Tarkio, Mo., May, 1903. Stated clerk, Rev. A. G. Wallace, D.D., Sewickley, Pa.

UNITED STATES. The total area belonging to, or under the jurisdiction of, the United States is estimated by the United States Coast and Geodetic Survey to be 3,731,900 square miles, divided as follows: United States, 3,025,600; Alaska, 577,390; Philippine Islands, 119,000; Hawaiian Islands, 6250; Porto Rico, 3530; Guam, Tutuila, with other Samoan islands, and Midway Island, 220. The total population, including Alaska and Hawaii but excluding Porto Rico and the Philippines, was given by the census of 1900 at 76,304,709. The population of the United States, exclusive of Hawaii, Porto Rico, and the Philippines, was estimated by the government actuary on June 1, 1902, at 78,833,000, while the population including these islands was given at 88,003,000.

Agriculture.—The year 1902, in marked contrast with 1901, was a year of plentiful harvests. The estimates of the Agricultural Department for 1899 were much below the census figures for the same year. There is good reason for believing that the census figures were nearer the truth. The department's figures for 1902 also appear to be much too small, so it may be fairly concluded that the 1902 crop was the largest yet recorded. Only in the case of wheat and rye did the yield of 1902 fall below that of 1901. The following table gives the yield and value of the principal grain crops of the United States in 1901 and 1902:

CROP.	1902			1901		
	Yield in Bushels.	Average Price Per Bushel, Cents.	Value.	Yield in Bushels.	Average Price Per Bushel, Cents.	Value.

The statistician of the Department of Agriculture estimated the growth of cotton in the United States in the year 1902-03 at 10,417,000 bales, of an average weight of 490.7 pounds. The acreage was estimated at 27,114,103 acres, a reduction of 764,227 acres or 2.74 per cent. See article **AGRICULTURE**, the separate articles on crops and the paragraphs on Agriculture in the articles on the States.

Industries.—See **MINERAL PRODUCTION; MANUFACTURES; IRON AND STEEL; COTTON INDUSTRY; SUGAR INDUSTRY; RAILWAYS; SHIPBUILDING; SILK INDUSTRY; WOOL.**

Foreign Commerce.—The imports and exports of the United States for 1892, 1901 and 1902, by countries, are shown in the table on pages 690 and 691, compiled from figures issued by the Treasury Department.

Compared with 1901, the year 1902 shows a falling off of \$104,673,925 in exports and a gain of \$88,901,043 in imports, making a decline in all trade of \$15,772,882. The decrease in exports was due first to the short grain crops of 1901, and secondly to the remarkable activity in domestic industries, which absorbed a larger proportion of the domestic output and made necessary larger imports. The falling off in corn shipments was most striking. The exports for 1902 were only 18,723,960 bushels valued at \$11,567,976 against 102,359,089 bushels valued at \$50,361,388 in 1901, and 206,135,233 bushels valued at \$82,728,589 in 1899. Wheat exports fell from 266,286,902 bushels worth \$201,458,506 to 211,945,731 bushels worth \$165,356,005; oats fell from 25,929,043 bushels valued at \$9,106,199 to 5,976,703 bushels valued at \$2,552,962. In 1898 exports of oats were 49,919,866 bushels valued at \$16,046,888. Exports of live stock were as follows: Cattle, 454,590 valued at \$36,606,204 in 1901, and 327,118 valued at \$24,301,969 in 1902; horses, 99,809 valued at \$10,037,204 in 1901, 60,694 valued at \$6,086,012 in 1902; mules, 25,053, \$2,267,262 in 1901, 16,306, \$1,744,192 in 1902; sheep, 432,419, \$2,514,766 in 1901, 235,497, \$1,492,484. Total exports of animals declined from \$51,825,944 in 1901 to \$33,839,293 in 1902, a decrease of \$17,986,651. Exports of all provisions also showed a very great falling off, from \$206,931,309 in 1901 to \$182,628,790 in 1902, a decrease of \$24,302,519. The items of provisions showing the greatest decline were bacon, \$39,402,500 in 1901, \$27,101,431 in 1902; pork, \$13,479,421 in 1901, \$12,169,585 in 1902; lard, \$51,626,346 in 1901, \$50,869,699 in 1902; oleo and oleomargarine, \$13,451,234 in 1901, \$11,124,850 in 1902; butter, \$4,184,966 in 1901, \$1,681,723 in 1902; cheese, \$3,006,344 in 1901, \$2,109,347 in 1902. Exports of raw cotton, decreased \$10,494,158; iron and steel, \$4,642,539; vegetable oils, \$2,854,462. The principal growth in exports occurred in the case of copper (other than ore), which showed an increase of \$11,950,699. This was due to the decrease in prices which followed the failure of the Amalgamated Copper Company to limit productions and hold prices above the normal level. Exports of manufactured cotton increased \$7,232,152, largely on account of the restoration of normal trade conditions in China, where most of the cheaper grades of American cottons are sold. Exports of unmanufactured tobacco increased \$7,779,383, and exports of fruit and nuts increased \$6,974,136. The following table gives the principal exports of the United States for 1901 and 1902:

LEADING EXPORTS OF THE UNITED STATES.

Grand total.....	\$1,438,078,651	\$1,333,288,491

The principal decline in imports occurred in sugar, which decreased \$18,195,623; coffee, \$5,998,380, and copper ore and regulus, \$5,996,853. The principal increase in value of imports occurred in iron and steel (not ore), which increased \$21,073,811; unmanufactured flax, hemp, etc., increased \$10,711,137; cotton manufactures, \$7,934,329; raw silk, \$7,580,045; manufactured silk, \$6,307,271; tea, \$5,826,095; wood and manufactures of, \$5,867,908; wool, unmanufactured, \$5,572,795, and wool, manufactured, \$3,167,044. In view of the disturbances in the anthracite coal region, it is interesting to note that exports of coal fell off only \$3,793,901, while imports gained only \$1,724,485, showing that the disturbance to the coal trade on account of the

a The commerce with Porto Rico is not included in the foreign commerce of the United States after June 30, 1900.

b The commerce of Hawaii is not included in the foreign commerce of the United States after June 30, 1900.

c Previous to 1896 includes Malta, Gozo, etc.; Falkland Islands, Aden, Auckland, Fiji, etc.

d Previous to 1896 includes Spanish Oceania, German Oceania and Africa.

e Previous to 1896 includes Tonga, Samoa, etc.

strike was not so great for the entire year as was reported. The total imports of merchandise for 1902 amounted to \$969,320,953, of which \$408,641,993 were free and \$560,678,960 were dutiable. Merchandise to the value of \$63,586,879 was brought in by cars and land vehicles. The following table gives the principal imports of the United States for 1901 and 1902:

LEADING IMPORTS OF THE UNITED STATES.

The movements of gold for 1902 were as follows: Imports, \$44,193,317; exports, \$36,030,591, making a net import of \$8,162,726. The movements of silver were: Imports, \$26,402,935; exports, \$49,272,954, making a net export of \$22,870,019.

The imports of merchandise for 1902 were \$391,380,982 less than exports. This, taken with the excess of silver exports and the excess of gold imports, gives a net excess of exports over imports amounting to \$376,673,680.

The amount of merchandise carried by American steam vessels for 1902 was: Imports, \$102,654,948; exports, \$73,158,215. The amount carried by American sailing vessels: Imports, \$13,000,767; exports, \$11,256,875. The value carried by land vehicles was: Imports, \$63,586,879; exports, \$120,086,835. The following table gives the amount of merchandise, both imports and exports, carried by foreign vessels:

NATIONALITY OF VESSELS.	Imports.		Exports.	
	Steam.	Sailing.	Steam.	Sailing.
Belgian	\$17,305,228		\$14,954,645	
British	404,213,088	\$16,526,180	732,775,073	\$33,443,408

Total foreign	\$767,725,999	\$22,352,360	\$1,066,469,806	\$62,296,760

Domestic Commerce.—Notwithstanding the poor crops of 1901, which greatly decreased production of breadstuffs and animals; together with the anthracite coal strike, which not only curtailed exports of coal, but greatly hampered the production of iron and steel, and many other manufactured articles, the domestic commerce of the United States for the year 1902 shows an enormous increase over the year 1901. The five packing centres of the West reported 5,031,308 cattle, 13,858,344 hogs, and 6,194,299 sheep slaughtered during the year 1902, making a total of 25,083,951 head of these three more important kinds of live stock. The number of cattle and the number of sheep slaughtered were the largest on record, but not since 1897 has the number of hogs slaughtered fallen so low. The receipts of wheat at eight interior markets, representing the spring and winter wheat sections, compare favorably with those of 1901. Receipts for the last five months of 1902 were 114,212,150 bushels as against 123,191,695 bushels for 1901. The decrease was more than compensated by the increase in the receipts of winter wheat, which amounted to 68,579,165 bushels in 1902, as against 38,201,784 bushels in 1901. The total receipts at the eight inland markets up to January 1, 1903, were 182,791,315 bushels as against 161,393,497 for the previous year, showing a gain of 21,397,836 bushels.

For the calendar year 1902 the total freight movement on the Great Lakes stood as follows: Receipts, 54,074,729 net tons, as against 45,007,019 net tons for 1901; iron ore and minerals constituted more than half the total freight tonnage of 1902, being 27,894,424 gross tons, as against 20,770,447 gross tons in 1901. Coal amounted to 8,256,117 net tons in 1902, as against 9,205,764 net tons in 1901. In the coasting trade of the Great Lakes for 1902, approximately 75,000,000 tons arrived at and cleared from ports of the lakes. The season's traffic for the Sault Ste. Marie ship-canal amounted to 35,961,146 net tons, as against 38,403,065 net tons in 1901.

The receipts of grain at New York during 1902, including flour, reduced to bushels, amounted to 114,926,823 bushels, in contrast with 136,783,751 bushels in 1901. In general, the same decrease may be noticed in the grain receipts at all the Atlantic ports, indicating not merely a decrease in yield of grain crops in 1901, but showing the sharp competition of the home market for our surplus agricultural products. Coal receipts at Boston for the calendar year 1902 were 4,280,209 tons, as compared with 4,812,419 tons in 1901. Of these amounts anthracite made up 2,163,558 tons in 1901 and only 1,054,170 tons in 1902. The Southern cotton movement to December 31 amounted to 6,773,598 bales, compared with 6,689,315 bales for the same period in 1901. The Southern mills used 820,500 bales. Receipts of naval stores at Southern primary markets were: Resin, 1,454,168 barrels, as against 1,600,836 barrels for 1901; spirits of turpentine, 461,824 casks, as compared with 505,937 casks in 1901.

Anthracite coal shipments for 1902 amounted to 31,200,940 tons, compared with 53,483,454 tons in 1901, and 45,107,493 tons in 1900. Some idea of the growth in volume of railway traffic may be gained by comparison of the number of cars handled by the thirty-eight different car service associations throughout the country, though sometimes not more than one-third of the cars actually handled are reported. The returns for 1902 reported 24,662,247 cars handled, as against 13,408,864 cars in 1901.

The commerce of the United States with its insular possessions increased considerably during 1902. Imports of merchandise from these islands for 1901 and 1902 were: Hawaii, \$27,012,866 and \$32,156,611; Porto Rico, \$8,751,751 and \$12,029,090; Philippine Islands, \$3,737,071 and \$10,211,303. The exports for the same years were: Porto Rico, \$6,958,677 and \$9,530,548; Philippines, \$4,158,699 and \$4,728,555. Exports to Hawaii for the entire years are not available, but for the last six months of each year they were \$5,803,758 and \$5,308,182.

Navigation.—The report of the commissioner of navigation for 1902 shows that the documented tonnage of the United States on June 30, 1902, was the largest in the history of the country. Up to that time the tonnage for the year 1861, which amounted to 5,539,813 tons, was the highest record of American shipping. In 1902 the total tonnage was 5,797,902 tons, of which 873,235 tons were engaged in foreign trade; 4,838,714 in the coasting trade, and 65,593 tons in the fisheries. Of the whole amount 2,621,028 tons were sail and 3,176,874 tons were steam vessels. The tonnage registered for the foreign trade and whale fisheries declined slightly (6574 tons) during 1902, but this was more than offset by the increased efficiency of vessels. Registered steel steam tonnage increased by 31,518 tons, and the average size of steamers increased over 10 per cent. The percentage of exports and imports carried in American vessels in 1902 was 8.8 per cent., as compared with 8.2 per cent. for 1901.

The following table shows the geographical distribution and motive power of United States shipping in 1901 and 1902, and the construction for the two years.

COMPARISON OF 1901 AND 1902.

Posts.—The report of the postmaster-general for the fiscal year ending June 30, 1902, showed that the total receipts during the year had been \$121,848,047.26, and the expenditures \$124,785,697.07, leaving a deficit of \$2,937,649.81. As compared with the previous years the receipts increased \$10,216,853.87, and the expenses \$9,231,776.67, diminishing the deficit by \$986,077.67. Among the recommendations made by the postmaster-general were that postal checks be authorized for sums of \$2 and less, in order to obviate expense and inconvenience to the poorer classes and those living in the rural districts; that for the convenience of general business interests, a return envelope be authorized on which the postage could be guaranteed by the original sender; that free delivery be extended to towns of not less than 5000 population and those returning not less than \$5000 annual postal receipts; and that the interstate commerce law be amended to prohibit telegraph and express companies from aiding such fraudulent schemes as are in violation of the postal laws. It was further recommended in view of the increased postal exchanges with Europe, that the minimum foreign letter rate of five cents be lowered. Much attention was also devoted by the postmaster-general to the question of second-rate mail matter. This mail matter during the fiscal year 1902 weighed 488,246,903 pounds out of a total of 745,742,872 pounds carried. But while the revenues from all mail carried amounted to \$116,728,644, the revenue from the second-class matter, aggregating in weight about 65 per cent. of the total, was only \$4,541,523.59, or about 4 per cent. of the postal revenues proper. The cost, it was estimated, of carrying second-class mails was 4 cents a pound, but under the second-class privilege, mail was carried for 1 cent a pound, entailing a loss to the government and a subsidy to the publisher of 3 cents a pound. The postmaster-general recommended, therefore, that except in the case of daily, tri-weekly, semi-weekly and weekly newspapers, periodical literature in future be charged at least the cost of its carriage; that is, 4 cents a pound instead of 1 cent. Early in the year 1902 three important events connected with the administration of the Postoffice Department took place. The first was the refusal of President Roosevelt to appoint a negro as postmaster in a Georgia office on the ground that a negro would be obnoxious to the patrons of the office. The second was the announcement by Postmaster-General Payne that fourth-class postmasters would be included under the civil service and could be removed only for cause. This was the most important development of civil service during the year. The other event was the presentation of a petition asking for the reduction of letter postage to one cent, and the relief from the abuse of privileges accorded to second-class matter.

Rural Free Delivery.—Rural free delivery was begun as an experiment in 1897, with an appropriation of \$40,000 for the establishment of 44 routes. In 1902, \$3,993,740 was appropriated, and up to November, 1902, 11,650 routes had been established covering 270,000 miles of country roads and serving about 7,000,000 of the

strictly rural population of the United States. The area covered was fully 300,000 square miles, and it was estimated by the department that about 700,000 square miles more, or one-third of the country's area exclusive of Alaska, might with advantage be embraced in the service. It was estimated that the initial annual cost of the service when completed would approximate \$24,000,000, and would entail a deficit of from \$8,000,000 to \$10,000,000; but that the increased revenues received would, within a few years, entirely support the service. In support of this contention, it was noted that wherever free rural delivery had been instituted, the increase in the revenues had risen from 2 per cent. to 8 per cent. or 10 per cent. annually; but it was said that even if this were not so, the advantages to those served were sufficient to compensate for a deficiency. Circulars, newspapers and periodicals reached the farmer in much greater number; he was able to ascertain the condition of the market, and so advantageously to sell or withhold his produce, and the tangible value of this might be estimated from the fact that the value of farm lands along the free routes had uniformly enhanced not less than 5 per cent. The service, the postmaster-general asserted, had proved immensely popular, and some 25,000 petitions for the establishment of extra routes had been filed. Additional appropriations by Congress were therefore asked.

Army.—The secretary of war issued an order, May 31, 1902, further reducing the strength of the army to 66,497 men. On October 24, 1902, the enlisted force was fixed at 59,866, or practically the minimum limit (59,131) allowed by Congress. This order when fully executed leaves the distribution of the enlisted force as follows: In the Philippines, 13,480; coast artillery in the United States, Cuba, and Hawaii, 13,298; field artillery in the United States, 3,320; cavalry in the United States, 8,540; infantry in the United States, 16,645; engineers in the United States, 866; staff departments, 2877; nine bands, 300; infantry in Pekin, 150; and infantry in Alaska, 390. Besides this force there would be, under existing law, the Porto Rican provisional regiment and the Philippine scouts. The secretary of war recommended in his annual report that the latter be continued, as their knowledge of the Philippine people and country rendered them of great value, and, since there was no longer occasion for a special and peculiar force in Porto Rico, that the former be discontinued and at the same time that the right of enlistment in the regular army be extended to the citizens of Porto Rico. The total strength and distribution of the army, on October 15, 1902, just previous to the issuance of the final army reduction order, were as follows:

COUNTRY.	Officers.	Enlisted Men.	Hospital Corps.	Total.
United States.....	2,476	44,163	1,868	48,507
Philippine Islands.....	1,039	19,800	1,504	22,433
Cuba.....	26	819	39	884
Porto Rico.....	11	228	37	276
Hawaiian Islands.....	9	198	15	222
China.....	2	131	5	138
Alaska.....	23	664	40	727
Total.....	3,586	66,003	3,598	73,187

In addition there were the officers and men of the Porto Rico provisional regiment, numbering 869, the Philippine scouts, numbering 5178, and the volunteer surgeons under orders for discharge, numbering 182.

Navy.—As shown by the report of the secretary of the navy for 1902, the only vessels accepted by the department, over and above those finally or preliminarily accepted in the year previous, were the battleship *Illinois*, 11,525 tons, the torpedo boats, *Thornton*, *Wilkes*, and *De Long*, the torpedo-boat destroyers, *Decatur*, *Perry*, *Preble*, *Barry*, *Chauncey*, *Dale*, *Paul Jones*, *Truxton*, *Whipple*, and *Worden*, and the monitor *Arkansas*. The construction of vessels authorized, the secretary found, had been unduly delayed. Battleships were from 10 to 29 months behindhand, protected cruisers from 6 to 18 months, and monitors from 16 to 19 months. The non-delivery of structural steel and the dearth of skilled labor were usually assigned as the causes of this. There were under construction on June 30, 1902, 8 battleships, 6 armored cruisers, 9 protected cruisers, 4 monitors, 13 torpedo-boat destroyers, 7 torpedo boats, and 7 submarine torpedo boats. The secretary had furthermore allotted the construction of the two battleships authorized by the congressional act of July 1, 1902, and specifications were in course of preparation for the two 14,500-ton cruisers and the two 1000-ton gunboats provided for in the same act.

See MANŒUVRES, MILITARY AND NAVAL; also NAVAL DEVELOPMENT.

The secretary emphasized, as had his predecessors, the pressing need for more enlisted men, and especially for more officers. There was a deficiency of 577 officers, based upon the vessels actually in service, and by the end of four years it was esti-

mated that the deficiency would be 428 additional, or over 1000 in all. Hence the secretary earnestly recommended that the number of midshipmen at the Naval Academy be largely increased, and he recommended also that the present number of enlisted men authorized be increased from 28,000 to 31,000.

Census Office.—By an act approved March 6, 1902, the census office, temporarily instituted in the Department of the Interior, in accordance with an act of 1899 to provide for taking the twelfth census (1900), was made a permanent office. All employees in the temporary office, above the grade of unskilled laborers, were made eligible for permanent appointment, and when appointed are to be considered under the protection of the civil service acts. It was made the duty of the census office to collect statistics of manufactures decennially, beginning with 1905; to collect annually statistics of cotton production, and to issue bulletins thereon weekly from September to January inclusive; to collect annually statistics of births and deaths from such States and municipalities as possess satisfactory records; and to issue before July 1, 1904, instead of as provided by the act of 1899 before July 1, 1903, all the various special reports authorized by that act, including those relating to crime, pauperism, charity, municipal taxation, valuation, and indebtedness, public and semi-public utilities, and mining. By another act approved June 30, the census office was directed to compile all available facts with regard to the condition of irrigation, the area of land reclaimed, and the cost and value of existing irrigation works.

Crop Statistics Dispute.—The dispute between the census bureau and the Department of Agriculture concerning crop statistics attracted a great deal of attention. Mr. John Hyde, of the Department of Agriculture, expressed great surprise because the wheat estimates made by the census bureau for the year 1899 were so greatly in excess of the estimates made by the Department of Agriculture. A similar discrepancy was noted between the estimate of the census bureau and that of the internal revenue office with regard to the tobacco crop, the estimate of the census bureau being 200,000,000 pounds in excess of the returns made by the internal revenue office. The internal revenue people believed that the amount of tobacco raised upon which no tax was paid could not exceed more than 500,000 pounds. Making all allowance for shrinkage there remained a discrepancy of not less than 70,000,000 or 75,000,000 pounds. Mr. Hyde criticized the methods employed in the census bureau whereby clerks were paid according to the number of cards they tabulated. He thought that this premium for speed-work was a source of much error. He also indicated that the enumerators themselves had made serious errors in estimating the wheat crop by including four or five million acres of winter wheat, which had been winter killed and was therefore not harvested. He also thought the enumerators themselves were not able to master the details of gathering agricultural statistics in the short time occupied by the census. He strongly believed that the estimates of the Agricultural Department would be vindicated by examination.

In reply to these criticisms Mr. L. G. Powers, the agricultural statistician of the census bureau, said, with regard to the wheat acreage, that the bureau had been exceedingly careful to exclude all wheat acreage that had been winter killed. As to the speed-work of employees he thought that the checking system employed in the census bureau precluded any possibility of serious error from these sources. Whenever error was discovered, the original schedules were looked up and the matter was rectified. Mr. Powers expressed great willingness to have the methods of the census bureau examined thoroughly. It was attempted to reconcile the discrepancy between the census figures and the internal revenue figures as to the yield of tobacco. We export about 90,000,000 pounds of tobacco to England every year, and it is there subjected to so heavy a duty that every effort is made to eliminate all waste and unnecessary moisture. The tobacco is stemmed and carefully dried, and statisticians figured that there might possibly be 30,000,000 pounds shrinkage from this cause. Then, again, there is great loss in weight by shrinkage in the tobacco used for cigars and cigarettes, amounting to probably 30,000,000 pounds. Another source of error probably arises from over estimates of tobacco on hand in storehouses, made by the farmers to the census enumerators.

According to estimates based upon the census figures the per capita consumption of wheat in the United States for the years since 1890 must have been 5.2 bushels. This appears to be altogether too large. The excess of the census office figures over those of the Department of Agriculture on wheat acreage was 18 per cent.; on wheat production, 20 per cent. As the Department of Agriculture made a special investigation of wheat production in 1897 and as a result of it added materially to its estimated area, it seems quite possible that the estimates of the department came nearer the truth than did those of the census bureau. It is of the utmost importance that crop statistics should be accurate, and the Department of Agriculture took measures to obtain more complete and reliable figures.

For *Immigration, Pensions, Railways, and Lands, Public*, see the special articles on these subjects.

Diplomatic Service.—Many important changes occurred in the diplomatic service during the year, both among the ambassadors and ministers appointed by the United States to foreign courts, and among those appointed by foreign governments to the United States. As to the former, Andrew D. White, ambassador to Germany, announced his resignation on August 5, 1902, to take effect on November 7. He was succeeded by Charlemagne Tower, of Pennsylvania, who was appointed ambassador to Russia in 1899, while Robert S. McCormick, of Illinois, who, in 1901, replaced Addison C. Harris, of Illinois, as minister to Austria-Hungary, was appointed ambassador to Russia in place of Mr. Tower. Bellamy Storer, of Ohio, appointed minister to Spain in 1899, succeeded Robert S. McCormick as minister to Austria-Hungary. Arthur S. Hardy, of New Hampshire, appointed minister to Switzerland in 1901, succeeded Bellamy Storer as minister to Spain. Charles Page Bryan, of Illinois, minister to Brazil since 1898, was appointed to succeed A. S. Hardy as minister to Switzerland. Lloyd C. Griscom, of Pennsylvania, appointed minister to Persia in 1901, succeeded Alfred E. Buck, deceased, of Georgia, as minister to Japan. It will be noticed that with one exception, all these changes were made by promotion through the vacancy at

*Chargé d'affaires.

†Counselor in the absence of the chargé d'affaires.

‡Chargé d'affaires in the absence of the minister, Mr. A. Grip.

§Count A. von Quadt Wykradt-Isny, chargé d'affaires, assumed temporary charge of the embassy in December.

¶Succeeded by M. Jusserand in August, 1902.

Berlin, caused by the resignation of Andrew D. White. This series of promotions, by which a number of ambassadors or ministers were each appointed to an embassy of somewhat more importance, represented perhaps the first recognition of the merit system in the history of the United States diplomatic service. A new legation, created during the year, was that of minister to Cuba, to which office Herbert G. Squiers, of New York, was appointed on May 5, 1902. Among special or

diplomatic appointments made during the year was that of J. L. M. Curry as representative of the United States at the coronation of Alfonso XIII. of Spain on May 16, 1902, and an embassy, consisting of Whitelaw Reid, Gen. John M. Wilson, and Rear-Admiral John C. Watson, to represent the United States at the coronation of Edward VII., of England. To fill the vacancy among the representatives of the United States at the Hague International Arbitration Tribunal, Oscar S. Straus, formerly minister to Turkey, was appointed to succeed ex-President Benjamin Harrison, who died in 1901. The other representatives of the United States on the tribunal are Melville W. Fuller, chief-justice of the Supreme Court; John W. Griggs, ex-attorney-general of the United States, and George Gray, of the United States Circuit Court. The principal changes in the diplomatic corps accredited to Washington were the appointment by Great Britain of Sir Michael H. Herbert, formerly secretary of embassy at Paris, as the successor of Lord Pauncefote, who died May 24, 1902; the appointment, announced on August 22, of M. Jusserand to succeed M. Cambon as ambassador from France; the unofficially announced appointment of Sir Liang Chen Tung to succeed Mr. Wu Ting Fang as minister from China, and the retirement of Herr von Holleben as ambassador from Germany. A semi-diplomatic appointment of importance to the Philippines was that on August 28, of Monsignore Guidi, as the pope's apostolic delegate to the islands. During the year the United States legation at Vienna and the Austro-Hungarian legation at Washington were both raised to the rank of embassies. The preceding table shows the accredited diplomatic representatives of the United States to foreign courts and the representatives of foreign nations at Washington.

Revenues and Expenditures.—The following table, compiled from figures given by the secretary of the Treasury, shows the total revenues (by warrants) and the total expenditures of the federal government for the fiscal years 1901 and 1902:

REVENUES.		
SOURCE.	1901	1902
Internal revenue.....	\$307,180,663.77	\$271,880,122.10
Customs.....	238,585,455.99	254,444,708.19

Grand total regular and permanent annual appropriations (b).....	\$776,348,318.47		\$750,063,837.00	\$710,150,862.88	\$730,338,575.99
By the Isthmian Canal Act (c).....			50,130,000.00		

(a) The River and Harbor bill failed to pass in 1901, but the sum of \$7,046,623 was appropriated in the Sundry Civil Act of that year to carry out existing contracts. To the amount granted in the River and Harbor bill of 1902 should be properly added \$5,489,377.50, included in the Sundry Civil Act and applicable to existing contracts; thus the entire amount voted for river and harbor improvements in 1902 was \$32,495,190.50.

(b) In addition, contracts were authorized subject to future appropriations, amounting in 1901 to \$4,224,640, and in 1902 to \$259,373,215; of the latter sum, \$18,306,000 was authorized by the Naval Act, \$38,336,160 by the River and Harbor Act, \$15,946,650 by the Public Buildings Act, and \$180,000,000 by the Isthmian Canal Act.

(c) Of the sum granted under this act, \$40,000,000 is contingent upon the purchase of the rights and purchase of the new Panama Canal Company. The remainder is only available when the Isthmian canal route is chosen. For these reasons this appropriation has not been included in the total.

Amount of estimated revenues for fiscal year 1903..... \$507,500,000.00
Amount of estimated postal revenues for fiscal year 1903..... 132,020,630.00

Total estimated revenues for fiscal year 1903..... \$639,520,630.00

The National Debt.—The amount and classification of the United States national debt at the end of the calendar years 1901 and 1902 was as follows:

	Dec. 31, 1901.	Dec. 31, 1902.
Interest bearing debt, at from 2 to 5 per cent., and redeemable variously from 1904 to 1930 inclusive	\$943,279,210.00	\$914,541,240 00
Matured and called non-interest bearing debt	1,339,790 26	1,255,710 26
Debt bearing no interest, treasury notes, etc.	388,612,563.88	395,777,109 63
Total gross debt	\$1,333,231,564.14	\$1,311,574,059 89
(except as to notes, etc. offset by cash held)		
Minus cash balance.	321,603,278.63	364,409,380 29
Total net debt	\$1,011,628,285.51	\$947,164,679.60

Banks.—See BANKS—BANKING; NATIONAL BANKS; PRIVATE BANKS; SAVINGS BANKS; STATE BANKS; TRUST AND LOAN COMPANIES.

CONGRESS (First Session).—The first session of the Fifty-seventh Congress convened December 2, 1901, and adjourned July 1, 1902. The membership at the time of adjournment was: House, Republicans 199, Democrats 149, Populists 4, and Silverite 1; Senate, Republicans 56 and Democrats 32. Senator Frye, of Maine, was re-elected president pro tem. of the Senate, and David B. Henderson, of Iowa, re-elected speaker of the House of Representatives. In his annual message to Congress President Roosevelt eulogized the character of his predecessor, William McKinley, and advocated stringent legislation against anarchy (see paragraph Anarchy). In the matter of trusts the President commented upon the exceeding intricacy and delicacy of business practice and organization, and the necessity, in order not to impair existing prosperity, of legislating for corporations without prior prejudice and only after full knowledge of all the facts involved. He thought that it was clear that there should be federal supervision of interstate corporations, and that if this could not be done under the constitution, power should be acquired by a constitutional amendment. (For his recommendations with regard to labor, see LABOR LEGISLATION.) On the tariff question he said: "Nothing could be more unwise than to disturb the business interests of the country by any general tariff change." Prosperity had been attained under it, and the "doubt, apprehension, and uncertainty" of a shifting tariff would be inimical to commercial well-being. (See TRUSTS.) Nevertheless, conditional upon the cardinal principle that duties should not be reduced below a point that would cover the difference between the cost of labor in the United States and abroad, reciprocity treaties should be freely entered into for the enlargement of the United States foreign trade. A strong plea was made by the President for the extension of federal aid in irrigating the arid lands of the West. Great reservoirs should be built, and main-line canals, irrigating land hitherto uninhabitable; and the rights to and distribution of the water should be adjusted in conformity with State laws and without disturbing vested rights. For the insular possessions of the United States the President advised legislation as follows: An adjustment of the title to the public lands in Porto Rico; a cable to the Philippines and China via Hawaii; mining, banking, currency, land, and timber laws for the Philippines to the end of developing their natural resources without allowing "improper exploitation"; and the granting of reciprocity to Cuba, for every reason of honor, of expediency, and of morality. "No single great material work" which remained to be undertaken on this continent, the President asserted, was "of such consequence to the American people as the building of a canal across the isthmus connecting North and South America." And as Great Britain had conceded in the newly revised canal treaty all the material points contended for by the United States, it only remained for the Senate to ratify that treaty and for Congress to authorize the canal's construction. Other recommendations made by the President, were for rendering the interstate commerce law more effective, for providing for a more elastic currency, for the crea-

tion of a general army staff, for the increase of the naval armament and personnel and for the extension of the civil service.

A number of bills of large and far-reaching importance were passed by Congress, and several others of hardly less significance were left pending at adjournment. Speaking generally, the press seemed to think that, barring certain obviously political omissions and commissions, the session had been unusually businesslike and effective. A strong minority sentiment for tariff revision developed early in the session among the western Republicans, who believed that the existing protective tariff was unequal and unjust and was principally responsible for assisting the eastern manufacturers to keep prices up to an artificial standard which the western farmer was compelled to pay. This sentiment, showing itself particularly during the discussion on Cuban reciprocity, in which it was complicated by the small but active "beet sugar faction" continually threatened to wrest from the speaker and committee on rules their ordinarily unquestioned control of the House.

Among the important laws enacted by the Fifty-seventh Congress at its first session were: A bill providing for the gradual irrigation of the arid Western lands and setting aside public moneys for that purpose (see IRRIGATION); a bill authorizing the construction of an isthian canal, preferably by the Panama route (see ISTHMIAN CANAL); a bill supplementary to the war revenue reduction act of March 2, 1901, repealing the remaining war taxes; a bill providing for the temporary government of the Philippines, ratifying and extending the authority and laws of the Philippine commission, and outlining a partially autonomous form of government to be established in the near future; a bill heavily taxing oleomargarine in the interests of the dairy farmers; a bill creating a permanent census bureau; a bill for the increase of the navy; a bill continuing the Chinese exclusion laws and extending them to the insular possessions of the United States (see LABOR LEGISLATION); a bill for the permanent establishment of the rural free delivery postal service; a bill extending the charters of national banks, and a river and harbor improvement bill carrying altogether \$65,000,000, and a public buildings bill carrying appropriations of \$20,000,000.

Of the bills which did not pass or were lost sight of in committee rooms nearly all were connected with the tariff or trust questions. Their failure was ascribed mainly to inter-party disagreement, accentuated by the approaching elections, in which congressmen would be dependent for re-election upon the opinions of their local constituencies. To please as many of these constituencies as possible, it was generally deemed desirable, in the case of doubtful bills, to pass them through one house and refer them to an inactive committee in the other; for in this way it might be implied as occasion demanded either that the bill was defeated or that it was on the verge of enactment. The Ship Subsidy Bill, for example, passed the Senate, but not the House; a proposal to amend the Constitution so as to provide for the direct election of Senators, passed the House, but not the Senate; the bill for the reduction of Cuban duties was amended by the House before passage so that the Senate would not accept it; bills passed the House alone for the admission as states of Arizona, New Mexico, and Oklahoma; for the amendment of the national bankruptcy law; for the extension of the eight-hour law; for the increase of salaries of Federal judges; for protecting the President against anarchistic attacks; for defining conspiracy and regulating the use of injunctions in labor disputes. Other measures of importance which passed the Senate but failed to secure the approval of the House were: Bills for creating a department of labor and commerce; for proposing an amendment to the Constitution regulating the succession to the Presidency; for protecting the President, the officers in the line of succession to the Presidency and foreign rulers against anarchistic attacks; a proposal to amend the Constitution so as to fix the date for the inauguration of the President on the last Thursday in April. The Senate refused to ratify the pending reciprocity treaties, no agreement was reached on a measure for the prevention of anarchy, and it became evident early in the session that no direct anti-trust, tariff revision, or currency bill would become law.

Various bills introduced or passed in Congress are noted in preceding or succeeding paragraphs of the article UNITED STATES. Reference should also be made to the general articles: BANKS—BANKING, BANKRUPTCY, CUBA, FINANCIAL REVIEW OF THE YEAR, IMMIGRATION, IRRIGATION, ISTHMIAN CANAL, LABOR LEGISLATION, PHILIPPINES, TRADE UNIONS, TRUSTS.

The second session of the Fifty-seventh Congress convened Tuesday, December 3. The President in his annual message recommended legislation for the public regulation and supervision of trusts and corporations. He earnestly recommended the subject to Congress with a view to the passing of a reasonable and effective law, and added that if the purpose mentioned could not be accomplished by such a law the Constitution ought to be amended so as to secure the necessary power. The reduction of the tariff as a means of reaching the evils of the trust would be

wholly ineffective, he thought. The President deprecated the destruction of the protective tariff or any violent or radical change therein, but advocated treatment of it from the sole standpoint of American business needs which could best be accomplished by reciprocity treaties, and suggested the appointment of a non-partisan commission of business experts to consider such treaties. Additional legislation he deemed desirable with regard to the monetary system, although no attempt ought to be made to reconstruct the financial system. After insisting on the need for fair treatment for labor and capital alike, the President recommended that a department of Commerce be created with a seat in the Cabinet. He urged reciprocity with Cuba and the conclusion of a convention with Great Britain for reciprocal trade with Newfoundland. He favored arbitration in place of war for the adjustment of international differences, vindicated the policy of holding the Philippines, and dwelt on the necessity for strengthening the navy as the surest way of preserving the present satisfactory relations with foreign Powers.

By the close of the year the only important measures that had made any headway in Congress were the bills to secure pure food and to admit Oklahoma to the Union as a State. The Hepburn pure food bill passed the House on December 19. Its purpose as stated in the title was to prevent the adulteration, misbranding and imitation of foods, beverages, candies, drugs, and condiments, and to regulate interstate traffic therein. By the terms of the bill the secretary of agriculture was authorized to provide a bureau of chemistry to be charged with the inspection of food and drug products offered for sale. Traffic in adulterated articles was made a penal offense. United States district attorneys were directed upon receiving information that certain foods or drugs were adulterated to prosecute the guilty parties. The secretary of agriculture was authorized to fix the standards of food products when advisable and to determine the wholesomeness or unwholesomeness of preservatives and other substances added to foods. On December 3d the Senate committee on territories reported a bill for the admission of one new state to comprise the territory now included in Oklahoma and Indian Territories. As the end of the year approached it became evident that this measure was to be the subject of protracted debate. Other measures that were occupying the attention of Congress at the end of the year were bills to restrict trusts and trade combinations, to create a department of commerce and labor, the Cuban reciprocity treaty, and the treaty with Colombia with reference to the construction of the isthmian canal.

Anarchy.—The assassination of President McKinley in 1901 led to much discussion of legislative measures for the suppression of anarchism and anarchistic teaching. President Roosevelt in his first message to Congress, recommended that stringent legislation be enacted in order to avert such anarchistic crimes as had caused the death of his predecessor. The federal courts, he said, should have jurisdiction in such cases; all immigration laws should be re-drafted to debar anarchists, and, as anarchy is fundamentally "an offense against the law of nations," it should be so declared by international treaties. Immediately upon the organization of Congress, bills were introduced both in the Senate and in the House looking toward the suppression of anarchy and the proper safeguarding of public officials, especially the President of the United States. One of the most noteworthy suggestions relating to anarchy was that made by Senator Hoar, of Massachusetts, proposing that anarchists be banished to some far-away island of the sea, where they might be allowed to practice their ideas without harming anybody but themselves. The press generally, however, regarded Senator Hoar's idea as ridiculous and wholly chimerical. Both Houses of Congress proceeded to pass laws making the killing or the attempt to kill the President or any of his legally designated successors, a capital offense under the Federal law. The Senate measure had in addition a provision for the establishment of a Presidential body-guard of regular troops. A conference committee appointed to harmonize the differences in the two bills had made no report by the end of the year.

Chinese Exclusion.—See LABOR LEGISLATION.

For legislation on the Philippines see PHILIPPINES.

Cuban Reciprocity.—One of the most important measures before the Fifty-seventh Congress was a bill to reduce the customs duties on sugar and tobacco imported into the United States from Cuba. The scheme of granting tariff concessions to Cuba had been favored by President McKinley, who argued that we were under strong moral obligations to deal liberally with the Cubans in matters affecting their commercial relations with us. The interests opposed to the measure were the representatives of the American beet-sugar industry, the sugar-cane interests of Louisiana, the sugar interests of Hawaii, the agricultural and commercial interests of Porto Rico, and the American tobacco interests. They strenuously denied that any moral obligation was involved in the matter, or that Cuba was really in need of relief. The ultra protectionists in Congress opposed it, on the ground that it violated the essential principle of protection, which should be kept

intact. They asserted that its effect would be the crippling of the beet-sugar industry and at the same time redound to the benefit of German competitors and the "sugar trust." If concessions were found to be necessary they thought they should be in the form of a rebate of a certain percentage of the revenues from Cuban imports into the United States in return for a corresponding reduction of the duties on imports from articles imported into Cuba from the United States. To this it was replied that inasmuch as the home production of sugar amounted to only 20 per cent. of the consumption the lowering of the duties on Cuban sugar would scarcely affect the home industry, since large quantities would still have to be imported from Europe. After a stubborn contest upon the part of the "insurgents," as the Republican opponents of the measure were styled, the Republican caucus adopted a resolution favoring the proposed reduction. Thereupon the ways and means committee reported a bill providing that whenever Cuba should enact immigration and labor laws as restrictive as those of the United States the President should be authorized to negotiate with Cuba a treaty of reciprocity on the basis of a mutual reduction of 20 per cent. in the tariff duties of the two countries, the said treaty to be in force only till December 1, 1903, a date near the time fixed by the Brussels Sugar Conference for the proposed abolition of bounties by the European beet-sugar producing countries. The beet-sugar Republicans now secured the aid of the Democrats in passing an amendment which provided that the duty on refined sugar should be no higher than that on raw sugar during the existence of the treaty. With this amendment the bill passed the House on April 18 by a vote of 247 to 52, the minority consisting chiefly of "insurgents." The bill then went to the Senate, where it was referred to the committee on relations with Cuba.

On June 13, after it had become known that funds had been expended by the military government of the United States in Cuba to influence sentiment in favor of Cuban reciprocity, the President sent a special message to Congress urging that such reciprocity be granted. Cuba, the President said, stood in a different position to the United States from any other country; she had granted this country special political concessions and in return this country should grant her the commercial concession necessary to her welfare. This concession, the President said, would injure no American industry. Reciprocity was a part of the Republican policy of protection, and so far as concerned the objection that benefit would inure to the sugar trust, provision could easily be made for assuring that the profit should go to the Cuban planter. For reasons of honor and of expediency the President urged that an adequate measure be passed. So far as appeared, the President's message was practically without effect upon Congress.

At a final caucus of Republican senators, held on June 18, nineteen members announced their unalterable opposition to the measure, and the session closed without further action by the Senate. It was then announced that a reciprocity treaty would be negotiated with Cuba and submitted to the Senate at the next session. The President then appointed Gen. Tasker H. Bliss a special commissioner to negotiate with the Cuban representative, Carlos de Zaldo. On December 26 the treaty which they had agreed upon was made public and shortly thereafter was laid before the Senate. The treaty was to be ratified on or before January 31, 1903, was to go into effect ten days thereafter, and was to continue in force for five years and from year to year thereafter subject to notice of termination by either party. A 20 per cent. tariff reduction was granted by the treaty on all Cuban imports into the United States, and, excepting as to tobacco, a reduction varying from 20 to 40 per cent. upon United States exports to Cuba. The main classes of American goods receiving more than a 20 per cent. reduction were: Machinery and apparatus of copper, iron and steel manufactures, glass (except window glass), whiskies, brandies, fish, and certain manufactures of cotton and articles of earthenware—25 per cent.; butter, chemical products, beverages, window glass, hemp-flax, and other vegetable fibres, musical instruments, paper (except for newspapers), certain kinds of cutlery, leather goods and cotton manufactures, plated ware, drawings, photographs, engravings, musical instruments, and vegetables—thirty per cent.; all other manufactures of cotton, wool, and silk, cheese, preserved fruits, paper pulp, perfumery and essences, certain articles of earthenware, soaps other than common, umbrellas, parasols, watches, glucose, and rice—forty per cent. At the close of the year no action looking toward ratification had been taken by the Senate.

The Oleomargarine Act—The oleomargarine law passed by Congress May 9, and taking effect July 1, provides for a tax of 10 cents per pound, to be paid by the manufacturer upon all oleomargarine. It also provided that "when oleomargarine is free from artificial coloration that causes it to look like butter of any shade of yellow, said tax shall be one-fourth of one cent per pound." Manufacturers of process or renovated butter are required to pay a tax of \$50 a year, and manufacturers of adulterated butter \$600 a year. Wholesale dealers in adulterated butter shall pay a tax of \$480 per annum, and retail dealers in adulterated butter

shall pay a tax of \$48 per annum. Every person carrying on the manufacture of process or renovated butter or adulterated butter without paying the special tax shall be required to pay the tax and a fine of not less than \$1000 nor more than \$500. Dealers in adulterated butter who do not comply with the law shall be fined not less than \$50, nor more than \$500 for each offense. Dealers in adulterated butter must sell only original or from original stamped packages. Any one not complying with the requirement of the law in this regard is liable to a fine of \$1000, and imprisonment for two years. Strict provisions are made for the inspection of the manufacture and sale of all artificial or renovated butter.

The bill received the support of the representatives and senators from the agricultural states, but was generally condemned by the trade papers and by the industrial and commercial interests. The *Journal of Commerce* said: "Oleomargarine has now been a prominent article of commerce for many years. Every effort has been made by interested parties to prove it injurious to health or to discredit the process of its manufacture, and without success. Chemically, it is butter and derived from the same natural sources as butter obtained by churning cream." The act was particularly condemned because it puts a prohibitory tax upon oleomargarine that is colored, while it is notorious that dairy butter is colored, yet no discrimination is made against it. The coloring matter used in the manufacture of oleomargarine is said to be harmless, which is not always true of the coloring compounds used in the manufacture of dairy butter. The constitutionality of a law which makes an act a misdemeanor in one case and not in another is more than doubtful. It is clearly taxing one legitimate industry for the benefit of another. The contention of the agricultural interests that oleomargarine is unhealthful has been shown to be false. The only other argument for such a measure is the benefits which would redound to the farmers. This is clearly class legislation and the benefits conferred upon farmers are more than counterbalanced by the hardships placed upon a legitimate industry and the increase in price of a necessary article of diet.

Ship Subsidy Bill.—On March 17, the so-called Frye Subsidy Bill, introduced by Senator William P. Frye, of Maine, to take the place of his unsuccessful bill of 1899, passed the Senate by a vote of 42 to 31. The bill had been brought forward on December 9, 1901; had been reported back with amendments by the committee on commerce on January 20, 1902, and after full discussion finally passed against a solid Democratic vote and against the votes of the Republican senators from Vermont, Iowa, and Wisconsin. From the Senate the bill was sent to the House and referred to the committee on merchant marine and fisheries, and there it rested when Congress adjourned on July 1. For this inaction there were several reasons. The adverse vote of six Republican senators had measurably deprived the bill of party standing; the constituents of many of the Western representatives were opposed to it; and the announcement of the international shipping combine (see SHIPPING MERGER) had intensified the prevailing impression that the bill provided unwarrantable favoritism rather than legitimate protection. Therefore, as the Congressional elections were impending, the bill was for the time being shelved.

The bill as agreed to by the Senate provided for three forms of subsidy: one to ocean mail steamships, another to merchant vessels, and a third to deep-sea fishing boats. The provision granting subsidy to mail steamships was in the form of an amendment to an act of 1891, under which the postmaster-general was authorized to enter into contracts with American registered vessels for carrying the United States mails. That act had been intended to induce the establishment of steamship lines to Europe, Asia, South America and Australia by the payment to them of perhaps three times the market mail-carrying rates. But the act had largely failed of its purpose, and to correct its deficiencies the present amendment was proposed. The amendment provided as did the law of 1891 for the conversion of the vessels to be subsidized into auxiliary cruisers in case of war, for their construction and ownership in America, and for crews at least partly American. When these conditions were met the postmaster-general was authorized to make contracts with the lines for not less than 5 nor more than 15 years.

Cabinet.—The appointment as postmaster-general of Henry C. Payne, member of the Republican National Committee from Wisconsin, in place of Charles Emory Smith, resigned, was confirmed by the Senate early in the year. On January 6, 1902, the President accepted also the resignation of Lyman J. Gage, of Illinois, appointed secretary of the treasury in 1897, and appointed in his place Leslie M. Shaw, governor of Iowa from 1897 to 1901. On March 6, the resignation of John D. Long, of Massachusetts, appointed secretary of the navy in 1897, was accepted, and the President appointed, as his successor, William H. Moody, congressional representative from Massachusetts since 1895. The members of the cabinet at the close of the year were as follows: Secretary of State, John Hay, of Ohio, appointed in

1898; secretary of the treasury, Leslie M. Shaw, of Iowa, appointed 1892; secretary of war, Elihu Root, of New York, appointed 1899; attorney-general, Philander C. Knox, of Pennsylvania, appointed 1901; postmaster-general, Henry C. Payne, of Wisconsin, appointed 1902; secretary of the navy, William H. Moody, of Massachusetts, appointed 1902; secretary of the interior, Ethan Allen Hitchcock, of Missouri, appointed 1898; secretary of agriculture, James Wilson, of Iowa, appointed 1897.

Congressional Representatives.—The two following tables show the composition of the Senate of the Fifty-seventh Congress in 1902, and the House of Representatives of both the Fifty-seventh and Fifty-eighth Congresses, giving the name, party, and home address of each member. Names marked * are those of representatives not returned to the Fifty-eighth Congress. Under the law of January 8, 1901, reapportioning the representatives among the States, the total number was increased from 357 to 386. No State lost a representative, and 20 States gained as follows: Illinois, Texas, and New York, 3 each; Pennsylvania, New Jersey, and Minnesota, 2 each; and Florida, Louisiana, Massachusetts, Connecticut, Colorado, Mississippi, North Carolina, North Dakota, Washington, Missouri, West Virginia, Wisconsin, California, and Arkansas, 1 each.

UNITED STATES SENATORS, FIFTY-SEVENTH CONGRESS.

Federal Judiciary.—The only change in the personnel of the Supreme Court during 1902 was the resignation, on August 11, of Associate-Justice Horace Gray, appointed from Massachusetts in 1881, and the appointment by the President, in his stead, of Hon. Oliver Wendell Holmes, chief justice of the Supreme Judicial Court of Massachusetts. It was announced, however, that Associate-Justice George Shiras, Jr., would retire early in 1903. The justices of the court at the end of the year, with the dates of their appointments, were as follows: Melville Weston Fuller, of Illinois, chief justice, appointed 1888; John Marshall Harlan, Kentucky, 1877; David Josiah Brewer, Kansas, 1889; Henry Billings Brown, Michigan, 1890; George Shiras, Jr., Pennsylvania, 1892; Edward Douglass White, Louisiana, 1894; Rufus W. Peckham, New York, 1895; Joseph McKenna, California, 1897; Oliver Wendell Holmes, Massachusetts, 1902.

Although no decisions that can be said to be of national importance were handed down during 1902, a number of questions, interesting to both laymen and lawyers, were settled. The final attitude of the United States courts in regard to the exemption clauses contained in the notices or contracts printed on passenger tickets was declared in the case of "The Kensington, 22 Sup. Ct. 102." The court held that stipulations for exemption from liability for negligence on the part of a carrier, to a passenger or baggage, were void, although the contract, which was

OLIVER WENDELL HOLMES

HORACE GRAY

made in Belgium, was valid by the laws of that country, and contained a stipulation that any question arising under it should be governed by that law. Since this decision the only protection left to ocean carriers in this regard is in the narrow provisions of the "Harter Act."

A provision in the Kentucky constitution, forbidding a carrier from charging more for a short haul than a long one, was held to be an interference with interstate commerce and void, where the long haul was an interstate haul. It was contended that this was merely a local regulation, but this was disallowed, the court jealously guarding the power given to the national government in the "Interstate Commerce Clause" of the Constitution.

The character of a railroad company as a carrier of mails was determined in the case of *Bankers' Mutual Casualty Co. vs. Minn. St. P. S.S. M. C.* (117 Fed. Rep. 434), which held that a railroad company is not liable to the owner of a mail package for its loss occurring through the carrier's negligence. This classifies a railway company as a public servant, and settles a mooted question.

Great interest has been aroused in the Western States by the case of the State of Kansas *vs.* the State of Colorado. In a preliminary decision upon a demurrer to the plaintiff's bill, which asked to have the State of Colorado restrained from appropriating the waters of the Arkansas River, which flows through both States, for irrigation purposes, the court held that it had jurisdiction in interstate controversies, that the matter in question appeared to come under that head, and overruled the demurrer, ordering further proofs as to the nature and extent of the use of the water before it will pass on the merits of the case. This decision as reported in 185 U. S. 125, settles the question of jurisdiction, and the final determination will involve vast agricultural interests in both States.

The case of the U. S. *ex rel.* Guaranty Trust Co. *vs.* Haggerty (116 Fed. 510) has an important bearing on the labor question. The court held that it had the power to restrain by injunction, a combination of persons, which is formed to induce employees, who are satisfied with their situations, to strike, for the purpose of inflicting injury and damage upon their employers. The defendants, labor agitators, held a mass meeting near certain mines, after the injunction issued, denounced the court, and endeavored further to induce employees of the mining company to strike. The court held them guilty of contempt of court. In the case of *In re Neavitt* (117 Fed. Rep. 448) the court holds that the President has no power to pardon civil contempts of court, as such an act would be interfering with an inherent and necessary attribute of the judiciary, which is intended to serve as a check on the legislative and executive powers. The case contained a dictum to the effect that the President has no power to pardon criminal contempts. Two interesting cases involving the question of whether the status of a foreign country is a political or judicial question, were decided during the year. In *Terlinden vs. Ames* the court sustained an application for the extradition of a Prussian subject, under the provisions of our treaty with that country in 1852, when it was an independent power. The court held that as both the German Empire and the United States recognized the treaty as still binding, the question became a political instead of a judicial one, and that the court was bound by the attitude of the government. Where, however, it became necessary to decide whether Algeria was a part of France, the court, in the absence of a contrary ruling by the state department, held the question to be a judicial one, and received proof of the laws of France. (*Tartar Chem. Co. vs. U. S.* 116 Fed. 726.)

An interesting question in the law of torts was decided by the United States District Court of Hawaii, October, 1902, in the case of *Campbell vs. H. Hackfeld & Co., Ltd.* The defendant company contracted to unload a vessel lying within the navigable waters of the harbor, and employed plaintiff as a laborer. The latter, while working in the ship's hold, was injured by defendant's negligence. The court held, that as the relation of the parties was not of a maritime nature, a court of admiralty had no jurisdiction. This decision will exclude a large number of cases of this class, which would otherwise be brought in the United States courts. The case of *Northern Assurance Company vs. Grand View Building Association*, will rank as a leading case in insurance law. A policy containing a provision against other insurance was issued to an applicant who had prior insurance to the knowledge of the insurer's agent. Parol or oral evidence of the agent's knowledge was held inadmissible, as varying the terms of a written contract. This is directly contrary to the leading case of *Van Shaick vs. Niagara Insurance Company* in New York, and will have the effect of forcing persons, insured under such circumstances, to bring their actions in the home state of the defendant company, to prevent removal to the United States courts, where this decision will govern.

The Illinois "Anti-Trust Law" was held invalid in the case of *Connelly against the Union Sewer Pipe Company*, on the ground that it was class legislation. The *Northern Securities Company* case was begun during the year and is still pending.

The final decision of this case by the Supreme Court will be of the very greatest importance in the financial world. See TRUSTS.

For the Illinois anti-trust law case see TRUSTS.

Foreign Relations.—During 1902 the United States continued to occupy an increasingly important place in international affairs, and on several occasions gave its authority and the weight of its influence to a peaceful settlement of international disputes. Three important arbitration decisions in which the United States was interested were decided. For the decision of King Oscar of Sweden in the damage cases growing out of the joint action of Great Britain and the United States in Samoa in 1899, see SAMOAN ISLANDS. For the decision of the Hague tribunal in the dispute with Mexico over the famous "Pious Fund," and the decision of Dr. Asser, as arbitrator in the Russian-American sealing dispute, see ARBITRATION, INTERNATIONAL. For Secretary Hay's Roumanian note, see ROUMANIA. For the Danish West Indian treaty, see DANISH WEST INDIES.

With Cuba, diplomatic relations proper were entered into by the appointment to that country, on May 5, of a minister plenipotentiary from the United States. The government of Cuba was formally turned over to the islanders on May 20. Extradition treaties were concluded and proclaimed with Chile on May 27; with Serbia on May 17; with Belgium on June 14; and with Denmark on April 17. A convention with Guatemala for the reciprocal protection of trade-marks and trade-labels was proclaimed on April 11. A supplementary convention was proclaimed on April 2 with Great Britain extending for twelve months, from July 28, 1901, the time within which British colonies or foreign possessions might give their adhesion to the convention for the tenure and disposition of real and personal property, signed on March 2, 1899.

A general treaty of amity, commerce, and navigation was concluded with Spain on July 3. A treaty with Great Britain, ratified by the Senate on June 30, gave to the United States the rights of the most favored nation in Zanzibar. The time within which the reciprocity treaty between the United States and France might be concluded was extended by an agreement reached in September. An extradition treaty between the United States and Chile was concluded on May 27.

In Colombia the long revolt of the Liberals against the Conservative government was practically ended in November by the desistance of the Liberals and a treaty of peace signed on board the United States ship *Wisconsin*. The revolt had necessitated, in September, the sending of warships to protect American interests and the landing of marines in order to secure to the United States the right of transit across the isthmus guaranteed her by the treaty of 1846.

On account of the insurrection in Venezuela, two United States cruisers were sent to La Guayra in August to protect American interests. The misuse of the United States flag by a Venezuelan gunboat within the three-mile limit off Ciudad led to a demand from the United States minister for an apology, which was readily given.

Owing to the continued reluctance of the government of Venezuela, as represented by President Castro, to meet its international financial obligations, two of its principal creditors, Great Britain and Germany, united, December 8, in accordance with a prior agreement, in presenting to Venezuela an ultimatum demanding immediate payment of the debts or satisfactory assurance that they would be paid. Venezuela failing to comply with the demands, the legations of the allies were closed, the British and German interests left in the hands of Mr. Herbert W. Bowen, minister of the United States to Venezuela, and a blockade of Venezuelan ports was instituted. On December 18, Venezuela proposed arbitration, and on December 20 the Powers offered to accept President Roosevelt as arbitrator. The President, however, declined this offer and suggested that the matter be referred to the Hague tribunal.

In the Orient the United States continued to press for a liberal treatment of China by the European powers. Russia had stipulated that its evacuation of Manchuria should be accompanied by industrial concessions from China, and that during the period of evacuation, which was to be prolonged for some three years, Russia was to have control of the Chinese troops in the province. Great Britain, Japan, and the United States objected to these terms, the United States especially protesting, on February 1, that they were in violation of treaty rights and of the principle of the "open door" consented to by Russia. On April 8, therefore, Russia modified its terms, agreeing to evacuate Manchuria within a year and a half, and officially declaring the province to be "an integral portion of the Chinese empire." The United States was also one of the signatory parties to the revision of the Chinese tariff effected during the summer and signed, in addition to the United States, by all the great European powers with the exception of France. Probably, however, the most important service rendered to China by the United States was in aiding to secure a reduction of the indemnity for damages accruing from the

Boxer outbreak. Claims advanced by the several governments on behalf of private persons would have largely increased the amount of this indemnity as originally fixed. The United States accordingly proposed that the official amount of the indemnity be decreased in order that without increasing the sum total, allowance could be made for private claims. This was finally agreed to in June, Great Britain waiving the objections which it had at first made to the plan. The United States also pressed for the payment of the indemnity in such a ratio of gold and silver as would not cause China to lose by the relative depreciation of silver currency.

The General Elections.—On November 4 the elections for representatives to the Fifty-eighth Congress occurred in all the States except Maine, Oregon, and Vermont, where they had already been held in September. In these three States the Republican candidates were all successful. In the November elections the Democrats made considerable gains, the large Republican majorities of two years ago being quite generally reduced. An interesting and significant phase of the election was the return to the Republican column of nearly all of the western States that had given their support to Bryan on the free-silver issue in 1896. The completed returns, however, showed that the Republicans would still have a majority of 22 in the House of Representatives of the next Congress, as against a majority of 43 in the Fifty-seventh Congress. This was the first election under the new decennial apportionment, 386 members as against 357 in the present Congress being chosen. The increased number of representatives were distributed chiefly among the States of the South and West, where the growth of population has been the largest.

UNITED STATES MILITARY ACADEMY. See MILITARY ACADEMY, UNITED STATES.

UNITED STATES STEEL CORPORATION. There was much discussion of this corporation during 1902 as a beneficiary of the protective tariff, a brief account of which may be found in the article TRUSTS (paragraph Political Discussion). The most important events in the history of the corporation during 1902 were its reorganization and its profit-sharing plan.

Reorganization.—On April 25, 1902, the plan of the directors of the United States Steel Corporation was made public, for the conversion into bonds of \$200,000,000, or approximately 40 per cent., of its preferred stock and for the issue in addition of bonds to the amount of \$50,000,000. The purpose of the plan, as stated by the directors, was to effect economies through additional capital, and to reduce annual charges, by a lower rate of interest. The annual interest saved in paying 5 per cent. upon \$250,000,000 of bonds instead of 7 per cent. upon \$200,000,000 of stock, would be \$1,500,000; but from this sum should be deducted \$1,010,000, set aside as a sinking fund to redeem the bonds within sixty years, thus leaving an initial annual saving of \$490,000. Of the net additional capital of \$50,000,000, it appeared that \$10,000,000, or 4 per cent. of the entire \$250,000,000 involved, was to be paid to an underwriting syndicate composed principally of J. Pierpont Morgan & Co., and some other directors of the company; the remaining \$40,000,000 was to be employed partially in paying an accruing indebtedness of \$10,000,000 or more, and partially in betterments and construction calculated to increase the annual revenues by some \$10,000,000 or \$15,000,000. As it seemed doubtful whether the New Jersey law of 1896 and the amendments thereof, under which the steel trust was incorporated, permitted the financial reorganization desired, a law had been passed to fit the case March 26, 1902, and under that law the stockholders voted on May 19. Two-thirds of both classes of stock, as required by the law, were voted in favor of the plan; the count standing 3,745,731 shares of preferred and 3,958,557 of common stock in the affirmative, and 4865 shares of preferred and 7675 of common, in the negative. By the plan as adopted every preferred stockholder was entitled to exchange 40 per cent. of his holdings for bonds, and, at his option, to subscribe for bonds for cash, to an amount equal to 10 per cent. of his holdings.

Profit-Sharing Plan.—In order to retain permanently in its service its most efficient employees, and to increase their interest not only in the constituent company for which they might work, but in the success of the corporation as a whole, the finance committee of the steel corporation promulgated on December 31, 1902, the following tentative plan of profit-sharing: (1) There would be bought by the corporation each year 25,000 shares of its preferred stock which employees might subscribe for at the market price, to an amount varying from 5 to 20 per cent. of their annual salaries, 5 per cent. for the highest paid officers, and 20 per cent. for the lowest paid employees. Payments might be completed upon the stock so subscribed for at any time within three years, but interest at 5 per cent. would be charged on deferred payments. On the other hand the corporation would pay 7 per cent. upon the stock, and would pay a bonus of 5 per cent. for five years if the stock was continuously held after having been completely paid for, and if the stockholder remained in the employ of the company. Some further bonus would also be made, the

amount to be derived from the bonuses withheld from those who did not fulfill these conditions; (2) the direct profit-sharing plan, which it had been found impracticable to extend to the lower paid employees who had consequently been given opportunity to subscribe for a greater relative amount of stock, was to readjust and reduce the salaries of all officers charged with active responsibility in the affairs of the corporation and in lieu of this reduction to set aside for such officers a certain per cent. of the corporation's earnings over and above its fixed charges. This would vary from 1 per cent. to $2\frac{1}{2}$ per cent., according to the annual net earnings of the corporation. Of the money so set aside, 75 per cent. would be distributed within the year, while the remaining 25 per cent. would be divided at the end of five years to those who had continuously remained in the employ of the company. Necessarily the plan, as thus outlined, is somewhat experimental and the finance committee reserved the right to change or modify it as occasion required.

UNIVERSALISTS, a sect whose distinctive tenet is the universal salvation of man, originated from the teachings of the Rev. John Murray, who came to America in 1770, and of the Rev. Hosea Ballou. The Winchester Profession of Belief was adopted in 1803 as the expression of Universalist faith. The church in 1902 had 750 ministers, 979 parishes, and 52,818 families, including a total membership of 53,508, a gain of more than 600 for the last year. The Sunday school members number 56,374. The value of parish property, less debt, is placed at \$10,158,453; and the total of parish expenses and contributions for 1902 was \$1,215,232. Thirteen new churches were erected or purchased during the year; the amount received for the twentieth century fund reached \$60,069; and the receipts for the Japan mission exceeded those of the previous year by \$1524. A new church has been erected in Tokio and is almost ready for service, and in the same city ground has been secured for a girls' home to cost \$3000. Two missionaries were employed in Japan during 1902. The financial summary of receipts for the year shows a grand total, covering the various activities of the denomination, of \$1,431,787. Of this sum, \$127,561 was contributed for missions, and \$64,275 was in gifts to the educational institutions, numbering seven in all. Permanent funds to the amount of \$903,661 are held by the church, those under the general convention aggregating \$352,570. The general convention, the sessions of which are biennial, will meet in Washington, D. C., October 21, 1903. President, Hon. William D. Washburn; secretary, Rev. G. L. Demarest, D.D., Manchester, N. H.

UNIVERSITIES, AMERICAN, ASSOCIATION OF, held its third annual meeting at Columbia University, December 29-31, 1902. The chief topics discussed were the certificate method of admission to colleges and universities in the case of accredited schools and of schools not examined by the university or formally accredited; the requirements for admission to professional schools; the uniformity of university statistics of enrollment and expenditures. Mr. J. H. Parkin, the agent of the Rhodes scholarship trustees, was present at the session and indicated the desire of the trustees for information as to the educational conditions in the United States, and for suggestions as to the administration of the scholarships. Officers for 1902-03: President, University of Chicago; vice-president, Leland Stanford, Jr.; secretary, Columbia; additional members of the executive committee, Princeton and Catholic University of America.

UNIVERSITIES AND COLLEGES. A question of great importance to the various universities and to the public, and one concerning which the greatest diversity of opinion exists, is that of the status of professional schools. Shall a preliminary degree be required for entrance to professional schools, or shall their work be based immediately upon that of the secondary schools? The discussions of 1902 centred upon this question. Three universities, Johns Hopkins, Harvard, and Columbia, took the position that the professional schools should be graduate schools, and they have placed their schools on that basis, though Columbia will not reach the graduate basis for two or three years yet to come, nor Harvard, either, in the case of the Medical School. This raising of standards means a loss of patronage to the institution and a curtailment of its income. In all probability, however, these disadvantages will be of short duration, and then will result at least as large a body, much better prepared, and consequently the work done will be of a higher character. This is the position of President Eliot, of Harvard, who argues further that the future of our civilization lies in the hands of the learned professions, and that it is the duty of the universities to place these on the highest plane and jealously guard admittance thereto. At the same time, these three institutions recognize that the entire period of preparation is too much prolonged as it now stands both for the prospective professional men and for the community. As a partial solution, preparation for earlier admission to college is urged; and also an abbreviation of the present four-year course for the degree of bachelor of arts. Johns Hopkins has had a three-year undergraduate course, Harvard has

made it possible for the exceptional student, and Columbia has permitted the taking of professional courses in the senior year. On the other hand, Yale and Cornell and all of the State universities have taken the position that no preliminary degree is necessary for admission to professional schools. The great objection urged is that the prospective professional man will be 25 or 26 years of age before he can enter his profession, that he will be 29 or 30 before he is established in it, and that practically family life is denied him to the great detriment of the profession, and of society as well as to that of the individual. It is further argued that many able men, and even the occasional genius will thus be kept out of the professions, which will be more and more restricted to those having wealth and leisure. Further, it is held that a good secondary education furnishes all the liberal training of a general character that is essential not only to success but to proficiency in and mastery of one's specialty. Amid it all it is clear that the old lines between the learned professions of the ministry, law, and medicine, and other professions not necessarily "learned," as engineering, teaching, architecture, etc., are breaking down, and that all professions now require a training adequate to the civilization of the day, and that they are thus on the same plane of learning as the traditional three. President Hadley, of Yale, holds that it is a patriotic duty of that institution to prevent an aristocracy of professions, and to do this by placing them all on the same plane of learning as that of the traditional college course. The University of Chicago has taken a middle ground in making a distinction between the first two years of the college course and of the last two, and of striving to bring the professional schools to the basis of a preliminary two years of liberal collegiate training. Other institutions have secured a similar result by allowing the senior studies to be elected from the professional schools. The entire question precipitated a discussion of much wider import and more spectacular character, which was the feature of 1902.

The Shortened College Course.—Instead of allowing the election of professional subjects in the senior year, a practice has grown up in a great many institutions of allowing the required number of points for graduation to be completed in less than four years' time. Harvard recommended this twelve years ago and has been permitting it, though the candidate has been required to wait until the expiration of the full four years before receiving the degree. In his annual report to the trustees and in various addresses afterward, President Butler, of Columbia, proposed that the present course be cut to two years of a wholly liberal character, and that the latter two years be made professional. The discussion of this proposition brought to light how general the practice has been of allowing a curtailment of the four years' course. Practically all the New England colleges permit this. The new college of Clark University begins its work on a three-year basis; but in the case of the old institutions the work for the three-year degree is in every case the old four-year course completed in a briefer time. Consequently it affects only a small number of students. At Yale since 1886 only six students have graduated in three years. At Tufts, since the adoption of the plan in 1893, thirteen students have succeeded in taking advantage of it. At Wellesley there has only been one; at Dartmouth probably two men each year. At Brown practically the same thing is accomplished by allowing a man to take his A.B. and A.M. at the end of the fourth year. At Harvard, while there has been a gradual rise in standards of admission, there has been also a lessening of the number of courses required for graduates from 21 in 1880 to 17½ (possibly 16) at the present time. Among the other large institutions of the East, Pennsylvania, Yale, and Cornell have announced that the degree will be conferred at the end of three years, when the requisite number of courses are completed. Thus all the colleges have aimed at the same result by one means or another,—either by lessening the number of courses required, by permitting more than one-quarter of them to be done in one year, by granting two degrees at the end of a four years' course, by allowing the senior year to be devoted to professional studies, and finally by cutting off the fourth year. The proposition to cut down the course to two years has met with few supporters among college presidents or professors, save President Butler. In addition to the arguments that a liberal training of collegiate character is an essential prerequisite to a professional course of study, and that the age of entrance to the profession must be lowered by contraction at some stage of the educational system, other arguments for the shortened college course are advanced. It is stated that fully two years of the present course have been added to the typical college course of fifty years ago, and that the college boy now is fully two years older at entrance than was the case half a century ago, so that the abbreviation of the course is a mere return to the old conditions, made all the more desirable now since meanwhile a two or three years' professional course has been added. It is also pointed out that, whereas the professional course was only one or two years in length if any was required fifty years ago, now the law course is for three

years and the medical is four. It is also urged that the very existence of the old-time college is endangered by the expansion of the secondary curriculum and the rapid growth of professional courses based directly on the secondary course. It is held that only by requiring a preliminary degree for entrance to professional schools can the colleges be preserved, and only by abbreviating the four years' course can this in justice be demanded. And yet the abbreviation of the course is most opposed by the smaller colleges and most favored in the larger universities where both college and professional schools exist. Evidently the discussion has just been opened, and it bids fair to continue for some years.

Athletics.—The interest of the year 1902 centred largely around the question of the expense of college athletics and the addition of the number of college sports. The income from the athletic events in each of the larger universities was in the neighborhood of \$100,000, and this chiefly from the football games. Out of this great sum Harvard had a surplus in 1902 of \$30,000, while Columbia came out with a deficit. This latter, however, is largely due to conditions requiring a very large expenditure for rental of an athletic field. Aside from this, however, there is very sharp criticism both in public and in collegiate circles of the expensiveness of college sports and of extravagance in administering the various sports. The training tables average eight to twelve dollars a week, which is three or four times the usual table expense of students; special trains or cars are chartered, and in various ways needless expense incurred. Two improvements are noted, both made at Columbia during the past year. The first of these is the use of graduates for professional coaches, as has been done at Yale and some other institutions for a long time. The second is the definite supervision of athletic expenditures by a faculty committee. The plan followed at Columbia is for each student organization to submit an estimate of expense for any future event with a guarantee of sufficient funds to meet this estimate. In such way both extravagance and debt are avoided. President Eliot emphasizes the fact that the number of competitive college sports has so increased that there is now a constant succession of them throughout the scholastic year, and that "the distraction of large bodies of students from the proper work of a university grows more intense and continuous year after year." This exaggeration of sports has become a serious drawback to secondary schools. President Eliot further charges, "In the college scientific school the afternoons of many students during the greater part of the year are devoted to play or to looking at the games which the most expert athletes are playing." The range of elective studies of the college is seriously limited because of the desire of students, and therefore of teachers, to avoid appointments in the afternoon. One favorable result, however, of this extension of games is the participation of a greater number of students than hitherto. Of the 3500 students in the regular student body at Harvard, more than 2000 took active part in one or more of the thirteen sports in which enumeration of the participants was made.

The Rhodes Scholarships.—The most remarkable as well as the largest gift to education in 1902 was the legacy of Cecil Rhodes (*q.v.*). He left about one-third of his estate for the establishment of scholarships at Oxford University to be apportioned as follows: Rhodesia 9, Cape Colony 12, Natal 3, Australia 18, New Zealand 3, Canada 6, Newfoundland 3, Bermuda 3, Jamaica 3, United States, 2 to each State and Territory, Germany 15. The Colonial and American scholarships have each an annual value of £300, and the German a value of £250, and are tenable at any college in the university for three consecutive academic years. The details of the scheme were not worked out, but were left to the executors. No system was provided for the selection of these students in the United States, but one is being devised by the educational and political authorities. In some States the appointments are to be made by the governors, and in some, on recommendation of university or other educational authorities. Great diversity of opinion has been expressed as to the probable outcome of the scheme, but probably Mr. Rhodes had greater expectations than will ever be realized. The aim, as stated in the will, was to strengthen the friendship between the two countries and to build up a great Anglo-Saxon—or even Teutonic—community of sympathies and interests. At best, the United States will be represented at Oxford by about one hundred students, about one-third of whom may be expected to return each year. The selections are to be based on: First, scholarship; second, qualities of manliness and personal character; third, qualities of leadership and apparent fitness for public life; fourth, physical qualities as shown in proficiency in sport. Dr. George R. Parkin, principal of Upper Canada College, Toronto, was appointed by the trustees to draw up a scheme for giving effect to the scholarship provisions.

Gifts.—Aside from the Rhodes gift, there were in 1902 no gifts on so large a scale as those of Mr. Carnegie and Mrs. Stanford in 1901. The University of Chicago has received an additional million from Mr. Rockefeller, which will be used for the most part in establishing a school of technology. The gifts of Mrs.

Phœbe Hearst during 1902 brought her gifts to the University of California during the past two years up to \$900,000. Pennsylvania, Yale, Harvard, and Columbia received about one million each from a great variety of sources. In several cases these represent the largest annual increase of funds ever received by these institutions. Teachers College (Columbia University) received about \$750,000, two-thirds of which was given by Mr. Rockefeller. Constant successions of small gifts to smaller institutions were a characteristic of the year, and indicate a growing custom. The president of Columbia called for \$10,000,000 to secure the pressing needs of the institution, and the president of Princeton for \$12,500,000 to place that institution on a broad university basis.

Changes in Presidencies.—The year 1902 was marked by an unusually large number of changes in administrative heads of universities. At Columbia Dr. Nicholas Murray Butler succeeded Seth Low; at Princeton, Dr. Woodrow Wilson replaced President Francis L. Patton; Prof. Edmund J. James, formerly of the department of political science in the University of Chicago, was elected to the presidency of Northwestern; President Joseph E. Swain, of Indiana University, resigned to accept the presidency of Swarthmore College, and Prof. E. E. Bryan of the faculty was advanced to the presidency; President Frank Strong, of the University of Oregon, was called to the Kansas State University; Carroll D. Wright, United States Commissioner of Labor, accepted the presidency of the newly organized college of Clark University. Prof. Henry C. King was chosen from the faculty at Oberlin to fill the presidency made vacant by the death of President John Henry Barrows. Professor E. A. Birge was chosen acting-president of the University of Wisconsin; Dr. G. E. Fellows, of the University of Chicago, was elected president of the University of Maine; Prof. Luther Foster from the faculty of the University of Wyoming became president of the New Mexico College of Agriculture; Dr. D. F. Bradley was installed as president of Iowa College; Rev. G. P. Benton went from the presidency of Upper Iowa University to that of Miami University; Rev. Normal Plass was elected to the presidency of Washburn College, Topeka, Kan.; J. W. Abercrombie to that of the University of Alabama; and Prof. George H. Denny to the presidency of Washington and Lee University.

Attendance and Classification of Students.—A noticeable feature is the continued increase in university attendance. There are now more than a dozen universities that open the year with upwards of two thousand students in attendance. This increase is due largely to the marked increase in the professional schools, especially the scientific schools. The registration figures for the full term of 1902 show a decrease in law and medicine, but this is due to the raising of standards of admission at Columbia and Harvard. There is a slight increase in the total number of

graduate students. The relative rank of the universities on the basis of the total enrollment is as follows: Harvard, Columbia, Michigan, Chicago, California, Minnesota, Cornell, Wisconsin, Yale, Pennsylvania, Northwestern, New York, Indiana, Nebraska, Missouri, Princeton, Stanford, Johns Hopkins. On the basis of enrollment in the faculties of arts and sciences the relative rank is as follows: Harvard, California, Cornell, Yale, Michigan, Minnesota, Wisconsin, Columbia, Nebraska, Princeton, Stanford, Indiana, Chicago, Missouri, Pennsylvania, Northwestern, Johns Hopkins. In graduate enrollment the rank is as follows: Columbia, Chicago, Yale, Harvard, California, Cornell, Pennsylvania, Johns Hopkins, Minnesota, Princeton. The foregoing table gives details of registration for the year 1901-02.

UPSON, ANSON JUDD, an American educator and clergyman of the Presbyterian church, died at Glens Falls, N. Y., June 15, 1902. He was born at Philadelphia, Pa., November 7, 1823, graduated in 1843 at Hamilton College, studied for the law at Utica, N. Y., and at Hamilton was successively tutor (1845-49), professor of rhetoric and moral philosophy (1849-53), and professor of rhetoric only (1853-70). Having been ordained to the Presbyterian ministry in 1868, he held the pastorate of the Second Presbyterian Church of Albany, N. Y., from 1870 to 1880. From 1880 to 1887 he occupied the chair of sacred rhetoric in the Auburn Theological Seminary, and subsequently was professor emeritus. He was vice-chancellor of the University of the State of New York from 1890 to 1892, and chancellor from 1892 until his death. His writings include sermons, addresses, lectures on historical and literary topics, and articles for periodicals.

URSO, CAMILLA, American violinist, known in private life as Mrs. Frederick Lueres, died in New York City, January 20, 1902. She was born in Nantes, France, and at an early age displayed unusual talent for music. Her first public appearance at the age of seven was followed by three years of study in Paris with Lambert-Joseph Massart, after which, in 1852, she came to America with her father and met with great success at concerts with Marietta Alboni and Henriette Sontag. She traveled extensively through Canada and Europe, was heard again in New York City, in 1866, and after a brief retirement from professional work following her marriage, returned to the concert stage with her former success.

URUGUAY, the smallest South American republic, lies on the Atlantic coast, between Brazil and Argentina. The capital is Montevideo.

Area and Population.—The estimated area is 72,210 square miles. According to the estimate of December 31, 1901, the inhabitants numbered 954,416. In 1901 there were 9620 immigrants (mostly Italians and Spaniards) and 6664 emigrants.

Government.—The executive authority is vested in a president, assisted by a cabinet of five members. The legislative power devolves upon a congress of two houses, the senate and the chamber of deputies. The president in 1902 was Señor Juan Lindolfo Cuestas, who was elected for the four-year term ending March 1, 1903. The regular army comprises about 3500 officers and men. The navy is considerable.

Finance.—The monetary standard is gold and the unit of value the peso, worth \$1.034. Revenue for fiscal years has been as follows: 1898, 15,200,000 pesos; 1899, 15,752,542 pesos; 1900, 15,141,554 pesos; 1901, 15,440,825 pesos. In the last two years customs receipts (import and export) amounted to 9,433,269 pesos and 9,654,442 pesos respectively. Statistics of expenditure are not available; the estimates, however, for the fiscal year 1901 were 16,124,373 pesos, and for 1902, 16,160,996 pesos. On June 30, 1902, the public debt amounted to 123,858,345 pesos, of which 98,802,084 pesos represented the foreign consolidated debt. The service of the debt in 1901, including interest 4,911,271 pesos, amounted to 6,902,557 pesos.

Industries and Commerce.—The raising of sheep and cattle is the most important industry, and wheat and corn are the leading agricultural products. Imports and exports in pesos have been as follows:

	1898	1899	1900	1901
Imports.....	24,784,360	25,652,788	23,978,206	23,691,932
Exports.....	30,276,916	36,574,164	29,410,862	27,731,126

In 1901 the chief imports were: Raw materials and machinery, 7,755,510 pesos; food products and groceries, 5,129,837; textiles, 3,936,184; beverages, 2,284,627; ready-made clothing, 954,333; live animals, 822,713. The leading exports were: Animal products, 25,931,115 pesos (26,605,662 pesos in 1900); agricultural products, 572,668 (1,669,523 in 1900); live animals, 473,422 (534,216 in 1900). The falling off in agricultural products was due largely to unfavorable climatic conditions (causing, especially, a poor wheat crop); while the decline in animal products was accounted for by the greatly reduced shipments of jerked beef. The wool export increased notably (8,662,000 pesos). Though the final figures were not available, it

was stated that commerce in 1902 showed a decided improvement over that of the preceding year. In 1901 the imports from and the exports to the countries of greatest trade importance were valued in pesos as follows:

	Imports.	Exports.		Imports.	Exports.
Great Britain.....	6,167,348	2,270,094	United States.....	2,077,750	1,938,128
Argentina.....	3,074,763	4,339,587	Spain	1,860,762	615,086
Germany.....	2,913,537	3,195,124	Brazil.....	1,540,955	4,454,250
France.....	2,161,139	4,925,604	Belgium.....	1,424,008	4,188,009
Italy.....	2,108,469	482,818	Cuba.....	99,615	403,475

The trade with Argentina consists principally of goods in transit. In the eleven-year period, 1891-1901, imports amounted in round numbers to 249,000,000 pesos and exports 330,000,000 pesos. In 1902 there were in operation 1208 miles of railway.

History.—In July, 1902, President Cuestas ordered the banishment of Senator Dominguez and Senator Mendoza, and the arrest of General Esteran and several other officers, charging them with conspiring to assassinate him. After considerable friction with the congress, the president, who defended his unconstitutional action on the ground of urgency, withdrew the decree. No convincing proofs of conspiracy were forthcoming. President Cuestas, though unpopular particularly with his own party, the Colorado, has done much toward political and administrative reform, and "has made it possible for his successors to rule uprightly." He has been arbitrary and at times probably actuated by personal spite, but, on the whole, his influence and efforts have been for good.

UTAH, a western State of the United States, has an area of 84,970 square miles. The capital is Salt Lake City. Utah was organized as a Territory September 9, 1850, and admitted as a State on January 4, 1896. The population in 1900 was 276,740, while in June, 1902, as estimated by the government actuary, it was 290,000. Salt Lake City is the largest city, with a population in 1900 of 53,531.

Finance.—There were in the treasury on December 31, 1901, \$620,359.63. The total receipts during 1902 were \$1,434,256.47 and the expenditures \$1,464,865, leaving a balance on December 31, 1902, of \$589,751.07. The main items of revenue and the amounts derived therefrom were: State officers' fees, \$76,058.65; taxes, \$856,127.08; temporary loans, \$100,000 (repaid); from the United States government for the maintenance of the agricultural college, \$25,000; and from insurance premiums, \$18,570.72. The total debt at the end of 1902 was \$900,000, all of which was funded. There was no increase or reduction of the debt during the year.

Agriculture and Industries.—The principal field crops of Utah for 1902, according to the *Crop Reporter*, were: Spring wheat, 176,824 acres, 3,748,669 bushels, \$2,848,988; oats, 44,970 acres, 1,596,435 bushels, \$750,324; barley, 8466 acres, 271,759 bushels, \$160,338; potatoes, 10,609 acres, 1,665,613 bushels, \$749,526; hay, 337,721 acres, 834,855 tons, \$6,477,139. The beet sugar produced in 1902 amounted to 15,625 tons, valued at \$1,106,875, an increase of 25 per cent. over 1901.

The State ranked fifth in sheep raising. The wool clip for 1902 amounted to 17,553,520 pounds, worth approximately \$2,280,000. Utah ranked third in the production of silver in 1902 and seventh in production of gold. The greatest development of the year was in copper mining.

Conventions and Platforms.—At the Republican State Convention, the platform declared against trusts and in favor of federal control of interstate commerce. The idea of arbitration to avert strikes was approved and laws that would prevent the unjust raising of prices and lowering of wages were urged. The platform adopted at the Democratic State Convention denounced trusts and the beet-sugar opposition to Cuban reciprocity. The Kansas City platform was indorsed without any mention of the name of William J. Bryan.

Elections.—At the regular State election held November 4, 1902, the Republican candidate for justice of the Supreme Court, McCarty, was chosen over Young, Democrat, by a vote of 43,214 to 38,433, giving McCarty a plurality of 4781. The State legislature for 1903 will consist of 11 Democrats and 52 Republicans.

State Officers.—For 1902 and 1903: Governor, Heber M. Wells (elected for four years, term ending January, 1905); secretary of state and commissioner of insurance, J. T. Hammond; treasurer, J. D. Dixon; auditor, C. S. Tingey; attorney-general, M. A. Breeden; superintendent of education, A. C. Nelson—all Republicans.

Supreme Court: Chief justice, R. N. Baskin; associate justices, George W. Barch and W. M. McCarty.

For congressional representatives, see UNITED STATES (paragraph Congressional Representatives).

VAN BENSCHOTEN, JAMES COOKE, an American Greek scholar, died in Middletown, Conn., January 17, 1902. He was born in La Grange, N. Y., December 15, 1827, graduated at Hamilton College in 1856, and at Madison University, now

Colgate, from which he received his master's degree in 1857. After teaching Greek and Latin at the Oxford Collegiate Institute and the Susquehanna Seminary, he acted as principal of the former from 1857 to 1858, and then studied at various European universities and traveled in Greece until 1861. Upon his return to America he became principal of the Lyons (N. Y.) high school, taught the classics at the Cazenovia (N. Y.) Seminary from 1862 to 1863, and from June, 1863, until his death filled the chair of Greek language and literature at Wesleyan University. During his visit to Athens he was instrumental in obtaining from the Greek government the gift of the site for the American School of Archaeology. He was a member of several continental classical societies, president of the Connecticut branch of the Archaeological Institute of America, and an honorary fellow of the Metropolitan Museum of Art. In 1875 he received the degree of LL.D. from Rochester University.

VAN SANT, SAMUEL R., re-elected governor of Minnesota in November, 1902, attracted wide attention earlier in the year by his opposition to the Northern Pacific-Great Northern merger. He was born at Rock Island, Ill., May 11, 1844, and was attending the Rock Island High School when the Civil War broke out. He left school and enlisted in the Ninth Illinois Cavalry, with which regiment he served in the ranks throughout the war, seeing considerable active service. After the war he studied for two years at Knox College, Galesburg, Ill., later engaged in the steamboat business on the Mississippi River, served for many years as captain of a river steamboat, and eventually became manager and part owner of several lines. He made his home in Winona, Minn., where he became prominent in Republican politics, was elected to the State legislature in 1892, 1894, and 1896, and was unanimously chosen speaker during his last term. He became the leader of the anti-machine Republicans, and was their candidate for governor in 1896 and 1898, but was defeated for the nomination each time by the organization candidate. The election of John Lind, the Fusion candidate for governor in 1898, however, made it necessary for the Republicans to nominate the strongest possible candidate in 1900, and the choice fell on Van Sant, who was elected by an unprecedented majority. His first term as governor was so notable for its straightforwardness and justice that a second nomination was accorded him in 1902 with practically no opposition.

VASSAR COLLEGE, Poughkeepsie, N. Y., founded 1861, had in the academic year 1901-02 an attendance of 862 and a faculty of 77. The endowment was \$994,054, and the income, including board and tuition, was \$372,286. There were 50,000 volumes in the library. During the year the college received the gift of a large chapel and the promise of a large library, to be erected during 1903. A chair of biblical literature was established, and instruction in Spanish was added to the work of the Romance department.

VENEZUELA, a republic of South America, lying on the Caribbean Sea, between Colombia and British Guiana. The capital is Carácas.

Area and Population.—The area of the republic is estimated at about 535,000 square miles, and the population, including the region definitely assigned to the colony of British Guiana by the award of 1899, amounted in 1894 to about 2,444,816. The populations of the principal cities in 1894 were: Carácas, 72,429; Valencia, 38,654; and Maracaibo, 34,284. The Roman Catholic is the state church. Primary instruction is free, and nominally compulsory.

Government and Finance.—The executive power is vested in a president, who is assisted by a cabinet and a federal council, the members of which are elected by the congress every two years. The council, from its own members, chooses a president who is also president of the republic. The legislative power is vested in the congress of two houses, the members of which are elected by direct popular vote. The present chief executive is Cipriano Castro, who became president after the overthrow of the Conservative government of Andrade in 1899.

The monetary standard is gold, and the unit of value, the bolivar, worth 19.3 cents. The revenue and expenditure balanced in the budget estimates of 1902 at 37,000,000 bolivars. The principal source of revenue is customs duties, placed in the estimates at 21,330,000 bolivars. The total foreign debt of Venezuela (1901) amounted with arrears of interest, to £5,171,148. The outstanding internal debt, in the same year, amounted to 110,000,000 bolivars.

Commerce, Industries, etc.—Coffee-growing is the principal industry, Venezuela being, next to Brazil, the largest coffee producing country in the world. The export of coffee at the principal ports in 1900 amounted to 46,139 tons (46,138,859 kilogrammes). Sugar, cocoa, and rubber are also produced. Cattle-raising is carried on extensively, and the mineral products, including gold, silver, copper, and iron, are worked, but not to the best advantage. The gold production in the Yuruari territory amounted in 1899 to 42,315 ounces, which was much below the average obtained a few years previously. The pearl fisheries of Margarita Island, and the

asphalt deposits in the Bermudez district are of considerable importance. Lumbering, cattle-raising, and fisheries engage a large number of the inhabitants. There are practically no manufacturing industries. The imports and exports, which have fallen off considerably in the past few years, owing to the prevailing civil war, amounted in 1898 to 42,797,500 bolivars and 74,497,550 bolivars respectively. Trade is largely with Great Britain, United States, and Germany. There were 529 miles of railway in operation in 1899.

HISTORY.

The Progress of the Revolution.—Early in January, 1902, the rebel steamer *Libertador*, formerly the British ship *Ban Righ*, carried the insurgent leader, Matos, from Trinidad, from which place he had been directing the revolt during the late months of 1901, to the Venezuelan coast near the Colombian border, where it was understood that he was in conference with some of the officials of the Conservative government in Colombia, that had a Liberal revolt on its hands. There was fighting between the rebels and Castro's forces during January on the peninsula of Paraguaná, in which the rebel troops were generally successful. Castro's position seemed to be daily growing more desperate; he had given up all attempts to aid the Colombian Liberals, and spent all his time devising methods and means to meet the growing revolution at home. Through February the revolt continued to gain strength and new uprisings were reported almost daily. On February 20 the Venezuelan congress met and approved Castro's election as president for a four-year term. On February 24 the defeat of the rebel, Barbira, at Las Cumbres brightened the government's hopes, and the announcement from Paris that diplomatic relations had been resumed with France seemed to better somewhat the international outlook. During March and April the rebels continued active, and it was rumored that Germans were supplying arms and ammunition to Matos. Early in May Castro began gathering his forces at Barcelona, marched against Cumana and captured it, and bombarded Carupano. Later in the month he reconstructed his cabinet, began suppressing unfriendly newspapers and making wholesale arrests, and forced loans. His activities caused the concentration at La Guayra of warships of France, Great Britain, Germany, and the United States to protect foreign interests. There was little fighting and practically no change during the months of June and July, except that although Matos took the field in person, and was said to have 10,000 men under him, Castro's position seemed to be somewhat stronger. On August 3, however, the tide set in the other way. The rebels under General Monagas attacked, and after three days' fighting took Barcelona, and a few days later also captured Porto Cabello. Castro was then practically hemmed in at Caracas and his cause looked hopeless indeed. During the second week of September a four days' fight at Tinaquilla resulted in another rebel victory. Castro then collected his forces for a last stand and, in a fierce battle near Victoria, on October 13, checked the rebel advance. On the second day Castro was reinforced and assumed the offensive, led charges in person, and after five days' continuous fighting compelled General Mendoza, the rebel commander, to withdraw. A fortnight later the revolution was apparently over, Matos had fled to Curaçao, and Castro and his army re-entered Caracas in triumph. The rebel forces which had so recently controlled almost all the important points in Venezuela seemed suddenly to have melted away. Whatever the cause the revolt certainly appeared to have collapsed. But it was simply the clearing of the stage for a new and more important act in which new actors were to play the leading parts.

Venezuela and the Powers.—There have been—according to the statement of some one who was interested enough to count—no less than eight revolutions in Venezuela in the past five years, and claims for damages had naturally accumulated. The presentation of these claims by France, Germany, and Great Britain had little effect. They ranged from seizures of shipping and ships' cargoes and destruction of foreign property during revolutions to non-payment of interest and principal on investments that had been made by foreign capitalists who were apparently willing to take their chances in the country in view of the extortionate charges they could exact. Theoretically, in international law, there is no limit to the extent and freedom with which one country may be called upon to assert claims against another for losses by adventurous capitalists or traders who have taken speculative chances in a notoriously revolutionary country. And of this latter character are most of the claims which European powers have been, for several years, pressing President Castro to pay.

The British and German Claims.—At the beginning of 1902 Castro's foreign secretary had, filed away in his office, great bundles of unsatisfied claims made principally on behalf of citizens of Germany, Great Britain, France and the United States, although other countries were largely represented. When, late in the year the crisis finally came, only the first two, and Italy, went to the extreme of employing force, France having arranged during the summer for a settlement of her claims by a

mixed commission, and the United States government being opposed from policy to acting as a collector of bad debts for its too speculative citizens. In general, Great Britain has followed the latter policy also, so that had there not been other apparently good reasons for interfering, it is doubtful if the claims of her investors would have been so forcibly supported, even by the Balfour ministry. The German claims were almost entirely demands for money damages for property of German citizens destroyed during the revolutions or for payment for public works, principally railroads in which German capital was largely invested. As early as 1895 the Germans had begun to invest heavily in Venezuela, establish commercial houses in its ports, and buy up coffee plantations in the interior. As time passed other avenues for the investment of German capital appeared. In 1896, a German bank, the Berliner Disconto Gesellschaft, made an arrangement to supply the funds for the construction of the Venezuelan Central Railway, whereby it advanced the sum of 50,000,000 bolivars at 5 per cent. for 30 years, Venezuela pledging its customs for security. The road, 200 miles long, was built by a German firm, to whom Venezuela paid 36,000,000 bolivars, guaranteed 7 per cent. on the capital invested, and pledged itself to set aside annually the sum of 3,000,000 bolivars as interest, and to provide for the amortization of the debt. Then the Germans capitalized the road at \$20,000,000 (American) and sent in the bills for the 7 per cent. payments. These payments were not made, and Castro, who succeeded to this legacy of debt from those he drove from power, is even less inclined to pay than his predecessors. To the 6,000,000 bolivars defaulted interest on the railway bonds, Germany added, in making up her statement of claims at the beginning of 1902, another 2,000,000 bolivars, as damages sustained by other German citizens in losses through destruction of property and forced loans, making a total claim of 8,000,000 bolivars. The greater part of the British claims dealt with the seizure of fishing smacks and coast-traders from the neighboring British colony of Trinidad by Venezuelan *guarda costas*, on the general but never verified ground that they were smuggling or carrying aid to the insurgents. The matter was complicated because some of the seizures were made near the little islands of Patos, off the Trinidad coast, the possession of which has long been a matter of dispute between Great Britain and Venezuela. Great Britain had also various rather indefinite complaints as to the action of the Venezuelan consul at Trinidad, and behind all the other claims—so far behind, indeed, that Mr. Balfour forgot to include them in the list of British claims which he recited for Sir Henry Campbell-Bannermann's enlightenment in the House of Commons—were certain claims of British bondholders who, like the Germans, found that they had made bad investments. Early in 1902, however, an incident occurred that gave Venezuela an opportunity to meet British demands at least, with a counter-demand for reparation. This was the affair of the British *Ban Righ*, later renamed the *Libertador*. When the *Ban Righ* was fitting out in London the British authorities were informed that the ship was to enter the service of the Matos revolutionists and recollecting the affair of the *Alabama* they made haste to look into the matter. Relying on the assurances of the Colombian minister at London that the ship was destined for the Colombian service, they allowed the *Ban Righ* to sail, forgetting that the Colombian Conservative government (see COLOMBIA), for whom the minister spoke, was practically, although not officially, at war with the Liberal government of Castro. The *Libertador* née *Ban Righ* proceeded to shell Venezuelan ports as soon as it got across the Atlantic, and worked other very considerable damage to Venezuelan shipping. It was only natural therefore that British demands for damages after that should be met with a refusal on Venezuela's part to pay any further attention to them until an explanation or satisfaction had been given for the conduct of the *Ban Righ*.

The Course of the Negotiations.—As early as December 11, 1901, the German ambassador at Washington presented a note to Secretary Hay, in which he set forth the hopelessness of further proceedings by negotiations, suggested that coercive measures might be necessary to collect German debts, among which the claims arising from the civil war should be first considered, and concluded with a tacit acknowledgment of the force of the Monroe Doctrine by assuring the United States that the "acquisition or permanent occupation of Venezuelan territory" was not intended. To this Secretary Hay replied, expressing the President's pleasure at "the voluntary and friendly declaration" of the German emperor's purpose, and then proceeded to assure him diplomatically that he would be taken at his word. The first six months of 1902 passed without any satisfaction being obtained by either Germany or Great Britain. On July 23, Lord Lansdowne, the British foreign secretary, and Count Metternich, the German ambassador at London, had a talk about Venezuelan affairs, in the course of which Lord Lansdowne replied to a question of the ambassador that he was "quite ready to confer with the German government with a view to joint action." Then, further stirred by seizure of the British ship *Queen* en route from Grenada to Trinidad, Lord Lansdowne directed Mr. Haggard,

THE VENEZUELAN TROUBLE—(Upper Left) President Castro. (Upper right) Herbert W. Bowen, United States Minister (Lower) Scene in Caracas. (*Courtesy, Collier's Weekly*)

the British minister to Venezuela, to address a formal protest to the Venezuelan government, informing them that unless prompt compensation were made, Great Britain would take steps to exact reparation. Minister Castro's chief of the foreign office received the protest with the remark that he was "used to receiving such communications," and on August 2 made a formal reply, expressing Castro's surprise at the tone of the British note and again declining to give any attention to British demands until Great Britain took some action on Venezuela's claims growing out of the *Ban Righ* episode. On August 8, Germany suggested a joint naval demonstration, and Lord Lansdowne with this end in view laid the matter before the Admiralty. The Admiralty thought that the most "convenient time" for the demonstration would be toward the end of November, when the British vessels employed off Newfoundland during the fishing season could be utilized. In this delay Germany concurred for the additional reason that the summer tropical sun was severe on German-bred seamen. On October 22 Lord Lansdowne's suggestion that both Germany and Great Britain should at once address notes to Venezuela which should convey the intimation that if evasion of their demands continued the Powers would be compelled to resort to force was accepted by Germany, and, on November 11, the notes were delivered. A dispatch of Lord Lansdowne of the same date to Mr. Buchanan, British chargé d'affaires at Berlin, contains the information that an agreement had been reached that the joint naval demonstration should begin with a seizure of all Venezuelan gunboats, to be followed by a blockade should that prove necessary. Lord Lansdowne concluded that although there was "a sharp distinction between the character of the British and German 'first-line' claims, nevertheless the two claims ought to stand or fall together, and we ought to exclude the possibility of a settlement between Venezuela and one of the two Powers without an equally satisfactory settlement in the case of the other." And thus came about the binding of England "hand and foot," of which the Liberals in Parliament complained. On November 17 Lord Lansdowne, replying to a German request that British claims be classified, said that Great Britain preferred to obtain a general settlement, but nevertheless suggested a classification which should place interference with the liberty and property of British subjects first, damages due to the civil wars second, and claims of bondholders last. On November 18 Venezuela's reply to the last note was received. It proved to be simply a refusal to listen to British demands until the *Ban Righ* matter was attended to, and ended with a complaint of "the unfair refusal of His Majesty's government to consider the matter." On November 22 Castro issued a statement that as soon as domestic peace was fully restored the government "would discharge its just obligations, improve its credit, and reorganize the fiscal system." At the same time negotiations were opened with the New York banking house of the Seligmans to arrange for a settlement of all foreign obligations. But it was too late. The Anglo-German combination was already in motion, and warships of the two countries were gathering on the Venezuelan coast.

The Ultimatums and the Blockade.—The naval plans of the Powers were perfected by December 7, and on that day the British minister, W. H. D. Haggard, and the German chargé d'affaires, Herr von Pilgrim-Baltazzi, leaving the ultimatums of their respective countries with Castro's foreign minister, left Caracas for La Guayra, where each went on board a cruiser of his own nationality. The interests of the two governments were intrusted to the care of Mr. Herbert W. Bowen (*q.v.*), the American minister. On December 9 the allied naval forces in pursuance of the plan adopted seized four Venezuelan gunboats in the harbor of Venezuela, and towed them out into the open sea where all but one of them which had been leased from a French firm were sunk, an act for which the British declared the Germans alone were responsible. On the same day the Venezuelan cruiser *Bolívar* was seized at Trinidad. The result of the allies' action was what might have been expected—the whole country waked to a newly discovered patriotism, and Castro issued a decree of amnesty to all his enemies and gave promise of immediate restoration of property. At the same time wholesale arrests were made of German and British residents in the cities, but on the demand of Minister Bowen they were released on the day following with the explanation that the president had only wanted to put them in "a place of safety, away from the fury of the populace." On December 10 the allies instituted what was said to be a "peaceful blockade" along the entire coast. On December 11 Baron De Riva, the Italian minister, presented an ultimatum from his government, and Italy thus became a party to the international blockade. President Castro after a long conference with Mr. Bowen on December 13 was convinced of the hopelessness of defending himself, and requested Mr. Bowen to submit through the State Department at Washington, a proposal to Great Britain and Germany for the settlement of the difficulties by arbitration. On the same day a Venezuelan mob pulled down the flag of the British steamer *Topaze* in the harbor of Puerto Cabello, as a result of which British and German cruisers got satisfaction by bombarding the fort and custom-house.

The Settlement.—Secretary of State Hay submitted Castro's arbitration proposal to the Powers without comment, but on December 16 he signified that it would be gratifying to the United States if the proposal were accepted. At the same time it was intimated that the United States could not recognize such an anomaly as a "peaceful blockade." On December 17, in the British House of Commons, Sir Charles Dilke elicited from Mr. Balfour the frank declaration that he agreed with the contention of the United States, that there was no such thing as a peaceful blockade, and that therefore a state of war actually existed between Great Britain and Venezuela. On December 20 an effective blockade was officially proclaimed, with a liberal allowance for vessels at sea. The previous day Great Britain, Germany, and Italy informed the United States that they would be willing to submit the differences to arbitration on certain conditions, most important of which was some assurance that Venezuela would accept the arbitrators' award, and acknowledge her liability under it. In acknowledging this decision Secretary Hay said that the latter question could be better decided by negotiation, and suggested that the matter be submitted to the Hague Tribunal. Germany and Great Britain joined on the next day in the request that in case arbitration were arranged President Roosevelt himself become the arbitrator. The President, through Secretary Hay, although signifying his willingness to serve if no one else could be found, suggested again that the questions at issue be submitted to the Hague Tribunal. President Castro, meanwhile, had commissioned Minister Bowen, with the consent of the United States, to proceed to Washington as his representative. He agreed to the principle of arbitration, and promised to abide by it, but preferred that the arbitrator should be the president of some American state, preferably President Roosevelt. On the last day of the year announcement was made of President Castro's acceptance of The Hague Tribunal as a court of arbitration, and the satisfactory termination of the difficulties could then be looked upon as assured.

VERESTCHAGIN, VASIL, a Russian genre and battle-scene painter, was brought again into prominence during 1902 by his exhibition at Chicago of pictures representing war scenes in the Philippines, and by his painting of the battle of San Juan. He was born in Tcherépovets, Novgorod, Russia, October 14 (26), 1842. After studying for a while under Markoff at the St. Petersburg Academy, where his first picture won a medal, and after extended travels through the Pyrenees and Caucasus mountains, he became a pupil of Gérôme in Paris, in 1864. From 1867 to 1870 he was with General Kaufmann in Turkistan; and after a tour through India in 1874-76, which with subsequent visits resulted in a well-known group of Indian pictures, notably "The Future Emperor of India," and "Suppression of an Indian Revolt," he followed the contending armies in the Russo-Turkish war. He has treated many sacred subjects, and has painted a series of pictures dealing with scenes in Central Asia, which are of great historical and anthropological interest, but his greatest achievements have been in the forcible portrayal of the horrors of warfare. His work is marked by intense realism and has received considerable critical disapproval for its lack of technique, but it has powerfully influenced public sentiment. "Solomon's Wall," "Christ on the Sea of Tiberius," "Jesus in the Desert," and "The Prophecy," are the best known of his religious pictures. Among the more celebrated of his war scenes are "The Pyramid of Skulls," "The Turkish Hospital Before Plevna," "Skobeleff at Shipka," "Assault on Plevna," "All Quiet at Shipka," "Before Moscow," "Napoleon's Retreat from Moscow."

VERMONT, a New England State of the United States, has an area of 9565 square miles. The capital is Montpelier. The population in 1900 was 343,641, while in June, 1902, as estimated by the government actuary, it was 346,000. The largest cities in 1900 were: Burlington, with 18,640 inhabitants, and Rutland, with 11,499 inhabitants.

Finance.—The cash in the treasury on June 30, 1900, was \$117,161.20. The receipts for the year ending June 30, 1901, were \$1,166,808.80 and the disbursements \$1,182,410.07, leaving a balance of \$101,559.93. The receipts for the following year were \$1,485,088.46 and the disbursements \$1,261,679.11, leaving cash on hand at the close of the biennial term ending June 30, 1902, amounting to \$324,969.28. Of the receipts for the year ending July 1, 1902, \$462,818.62 were received from corporation taxes; \$268,522.49 from the State tax of 1901; \$143,211.97 from the State school tax of 1902; \$89,508.50 from the State highway tax of 1902; and \$275,000 from a temporary loan. This loan, however, was covered before the end of the year. In his message to the legislature on October 3, 1902, the governor stated that it appeared to him that without unjustly burdening any interest all the expenses of the State government should be raised by indirect taxation, thus entirely relieving real estate.

Agriculture, etc.—The principal field crops for 1902, according to the *Crop Reporter*, were: Corn, 57,718 acres, 1,258,252 bushels, \$855,611; oats, 77,780 acres, 3,111,200 bushels, \$1,337,816; potatoes, 27,133 acres, 2,550,502 bushels, \$1,479,291; hay, 926,878 acres, 1,177,135 tons, \$11,359,353. The dairy products had a value of

\$9,321,389. The values of the stone products of Vermont for 1900 were: Granite, \$1,113,788; slate, \$917,462; marble, \$2,484,852; limestone, \$188,100; for 1901: Granite, \$1,245,825; slate, \$1,162,191; marble, \$2,753,583; limestone, \$205,138.

There were in Vermont on June 30, 1902, 1,061.98 miles of steam railroads, and 81.99 miles of electric railways. There has been no increase in the mileage of steam railroads in the State for the two years since 1900, but curves have been straightened and the tracks improved by heavier rails and better ballasting.

Conventions and Platforms.—The Republican State Convention was held at Montpelier June 19, 1902. In the platform President Roosevelt was indorsed, trusts were condemned, a law regulating primaries for the nomination of town, city, county, and State candidates was called for, and a request was made that the legislature make provision for ascertaining the will of the people by direct vote on the acceptance or rejection of a license and local option law. There was a split in the Republican ranks as a result of this convention, a considerable number of those present being dissatisfied with the methods employed to bring about the nomination of Gen. John G. McCullough, who favored local option, for governor. Those who did not accept that nomination held a convention at Burlington on July 16 and nominated Percival W. Clement, who favored high license. In the platform of this second convention a demand was made that the legislature enact a high-license local-option law, and that the same be submitted to the voters, to become effective only when a majority of the voters have signified their approval. The leaders of the convention inserted a resolution calling upon the legislature to pass a law regulating primaries or caucuses called for the purpose of putting in nomination candidates for office.

The Democratic State Convention was held at Burlington July 24, 1902. It denounced the policy of "benevolent assimilation" and an American colonial system; favored the abolition of all tariffs on trust-made articles; insisted upon the prompt fulfillment of pledges made to Cuba; accused the Republicans of corrupt methods in making nominations for State offices; demanded the passage of a fair local option law; and opposed a referendum on the subject.

Elections.—The gubernatorial contest of 1902 was one of the most interesting and exciting contests ever held in that State. At the Republican caucuses, held June 14, three millionaire candidates for the governorship came out on as many different platforms. Mr. Fletcher Proctor advocated prohibition; Gen. John G. McCullough, local option; and Mr. Percival W. Clement, high license. When the Republican convention met, General McCullough was nominated on a local option platform. Mr. Clement then conducted an independent campaign, and stumped the State, advocating high license. At the regular election held September 2, 1902, the vote stood: McCullough, 31,864; Clement, 28,201; McGettrick (Dem.), 7364; Sherbourne (Pro.), 2498. The Vermont law requires that officers must receive a majority of the votes cast to secure election. As neither governor nor lieutenant-governor received a majority of the total vote cast, the choice fell to the legislature, which met the last week in September. A canvass of the vote for State officers was made under a joint resolution October 1, and it was announced that McCullough had received 164 votes; Clement, 59; and McGettrick, 45; thus electing McCullough, who was inaugurated October 3. All the other State officers chosen were Republicans. In November, a bill calling for a referendum to the voters upon the question of local option as a substitute for prohibition, passed both branches of the legislature. The Prohibitionists, in their attempt to defeat the referendum act, advocated a provision that women should have a voice at the polls in deciding the question. This effort failed by a vote of more than 2 to 1. In the debate considerable support was given to the measure establishing a dispensary system similar to that of South Carolina. The legislature for 1903 will consist of 25 Republicans and 5 Democrats in the senate and 192 Republicans, 48 Democrats, 1 Independent, and 1 representative of the Labor party in the house.

State Officers.—For 1903: Governor, John G. McCullough, elected for two years, term ending October, 1904; lieutenant-governor, Zed S. Stanton; secretary of state, Frederick G. Fleetwood; treasurer, John L. Bacon; auditor, Horace F. Graham; superintendent of education, W. E. Ranger—all Republicans.

Supreme Court: Chief justice, John W. Rowell; associate justices, James M. Tyler, Loveland Munson, Henry R. Start, John H. Watson, Wendell P. Stafford, and Seneca Haselton.

For congressional representatives, see UNITED STATES (paragraph Congressional Representatives).

VIBERT, JEHAN GEORGES, a French painter, died at Paris July 28, 1902. He was born in Paris, September 30, 1840, was a pupil of Barrias and Picot, and first exhibited at the Salon in 1863. In addition to his work in oils, he painted skilfully in water-colors, and he was a founder of the Société des Aquarellistes Français. A clever technician, he was careful in drawing and precise in matters of detail, but in

coloring was not so successful. Among his canvases are "Gulliver" (1870); "The Reprimand" (1874); "The Grasshopper and the Ant" (1875); "Monseigneur's Antechamber" (1876); and "Apotheosis of M. Thiers" (1878), a large work, purchased by the state for the Chamber of Deputies; but later deposited in the Luxembourg. He published *La science de la peinture* (1891).

VICTORIA, a southern state of the Commonwealth of Australia, has an area of 87,884 squares miles and a population, according to the census of 1901, of 1,200,914, an increase of less than 5 per cent. over 1891. Melbourne, the capital, has a population of 493,956. Other large towns are Ballarat, 46,410, and Bendigo, 43,112. Primary education is compulsory and free, the enrollment in the state schools in 1899 being 239,732. Private schools enrolled 52,318.

Government and Finance.—The executive power is vested in a governor (Sir George Lydenham Clarke since 1901), appointed by the crown, and assisted by a responsible ministry of 10. The legislative power rests with a parliament consisting of a council and an assembly, both elective. The revenue for the fiscal year 1902 was £6,995,753 and the expenditure £7,433,364, leaving a deficit of £437,611, that was reduced to £330,611 by the deduction of the surplus of £107,000 from the previous year. The estimates for the fiscal year 1903 placed the revenue at £6,980,950 and the expenditure at £7,431,670. The sum of £300,000 spent for old-age pensions is one of the principal items in the expenditure. To meet the deficit it was proposed to lower the income-tax minimum in order to include incomes of £150 instead of £200, as at present, to reduce the personnel of the civil service, and lower all government salaries from 3 to 10 per cent. On June 30, 1902, the debt was £53,306,000, of which £45,648,000 represented reproductive works, largely railways.

Industries, Commerce, etc.—The yield of the principal cereal crops in 1901 was: Wheat, 17,847,000 bushels; oats, 9,582,000 bushels; and barley, 1,215,000 bushels. In 1900, 2,578,126 gallons of wine were produced. Victoria is the second gold-producing state in Australia, but owing to the drought the output has fallen, being in 1901 only 789,562 ounces, as compared with 854,500 ounces in 1899. Tin, copper, coal, and antimony are also mined. Dairy products are important, 465,469 milch cows in 1900 producing 55,604,118 pounds of butter and 4,284,170 pounds of cheese. The number of sheep in 1899 was estimated at 12,300,000, but the drought has naturally wrought havoc in the live-stock industry. The manufactures are mainly for home consumption. In 1901 the value of the imports was £18,301,811, and of the exports £17,422,552. The chief items of export were wool, gold, butter, wheat, oats, live-stock, and live-stock products. On June 30, 1901, there were 3,221 miles of railway in operation, all belonging to the state.

HISTORY.

A Political Crisis.—On May 5, 1902, Premier Peacock received the collective resignations of his cabinet, but the personal difficulty that had led them to resign having been settled, they consented, at his request, to remain in office. On the meeting of parliament later in the month an extensive programme of constitutional reform was proposed. On June 3 Mr. Irvine brought up the question of the ministry's resignations, declaring that they were remaining in office contrary to the constitution. A resolution of censure was then passed by the assembly by a vote of 45 to 42, whereupon Premier Peacock and his colleagues resigned. A new cabinet was immediately formed by Mr. Irvine as follows: Premier and attorney-general, W. H. Irvine, treasurer, W. Shiels; minister of labor, John Murray; education and public health, R. Reid; mines and water supply, E. H. Cameron; agriculture and public-works, J. W. Taverner. Premier Irvine at once outlined his legislative programme, which included the reduction in membership of the cabinet, council, and assembly, a general scaling down of salaries, retrenchment in every administrative department, and increase of taxation.

The "Civil Servants."—But the reform premier had not progressed very far in his policy of retrenchment before he encountered a most serious obstacle in the opposition of the "civil servants," who, in socialistic Victoria, are a very considerable body numerically. It was just such a crisis as one would have looked for in a state which has carried to extremes, surpassed only by New Zealand, a policy of owning and running public utilities for the benefit of the employees rather than the public. Mr. Irvine's reform bill, introduced in August, 1902, provided for stopping all increments of salaries to civil servants and for a percentage reduction in the salaries of all state employees receiving more than £125 per annum. Immediately the entire civil service, including the state railway employees, rose in revolt and a strike was threatened. The assembly became alarmed at the threatening attitude of the "public servants," and a large number of members, who, under ordinary circumstances, could be counted upon to support the ministry, aligned themselves with the Labor party, and voted against the bill. Premier Irvine determined to make a fight on his measure, and the assembly was dissolved on September 9. The elections that followed the

premier's appeal to the country resulted in a striking vindication of his policy, for although the Labor party gained two members, the ministers were all returned, and found themselves backed by a majority of 36. With the meeting of the new parliament the reform measure was pushed through both houses, in spite of the strenuous opposition, and Premier Irvine then turned his attention to punishing the "civil servants." With this end in view he brought in a bill that practically disfranchised the entire body, although allowing them separate representation on a limited scale. He declared in introducing the measure that he would resign if defeated on this point, as no government could go on if exposed to a continuous pressure for increase of salaries. On December 10, 1902, the bill passed the assembly by 11 majority, thus practically assuring its enactment, since the council is a strong ministerial body.

Social and Industrial Conditions.—The drought, which has prevailed for several years, was felt in 1902 more severely in Victoria than in any other state of the Commonwealth. The mines were being closed, live-stock dying or being killed off, crops drying up, and the cities swarming with unemployed laborers from the country districts. Lack of business in some parts of the country has resulted in the temporary discontinuance of several railway lines. Immigration has entirely stopped and emigration, especially to South Africa, has set in to an alarming extent. Interstate trade and commerce are both falling off. Radical methods have been adopted for the conservation of water for stock and domestic purposes, and for united action on the part of Victoria, New South Wales, and South Australia for utilizing the waters of the Murray River in order to provide adequate irrigation for the northern districts of Victoria.

VIELE, EGBERT LUDOVICKUS, a brigadier-general of volunteers in the Union army, died April 22, 1902, in New York. He was born June 17, 1825, at Waterford, N. Y., graduated at West Point in 1845, served in the Mexican war and in Indian campaigns, and was commissioned first lieutenant in 1850. He retired from the army in 1853 and took up his residence in New York City, where he became a civil engineer. He re-entered the army at the outbreak of the Civil War, and in 1861 was commissioned brigadier-general of volunteers. He acted as second in command in the Port Royal expedition, and captured Fort Pulaski and Norfolk, where he was military governor for eighteen months. He was then put in charge of the drafting of troops in the northern part of Ohio. In 1863 he retired from the army and again took up civil engineering. He was elected to Congress as a Democrat in 1885, served later on the board of visitors to West Point, was instrumental in securing the legislation for the Harlem ship canal, and was the originator of many improvements in New York City. In 1896 he spoke on municipal administration before the committee of the British House of Lords at the invitation of that body, and at The Hague Congress of History in 1898 he delivered the closing address. He was vice-president of the American Geographical Society, president of the Aztec Club, and a trustee of the Holland Society. His *Handbook for Active Service* was used extensively during the Civil War.

VIRCHOW, RUDOLF, a German scientist, founder of the science of pathology, died in Berlin, September 5, 1902. He was born in Pomerania, October 13, 1821, the son of a shopkeeper and farmer, and after receiving a medical education at the University of Berlin, was appointed in 1847 to the staff of the Charité Hospital. He soon became known as a brilliant investigator in physiology, and with Reinhart in 1848 founded the *Archives für pathologische Anatomie und Physiologie* in which were published the results of his earlier experiments and investigations. His scientific attainments were also recognized by an appointment as lecturer at the university, but his position and all other government favor he lost by his espousal and advocacy of Liberal political ideas and sympathy with the uprising of 1848. Welcomed, however, for his scientific attainments at the University of Würzburg, he there founded a pathological laboratory which soon achieved an international reputation among students of medicine. In 1856 he was recalled to Berlin, and two years later published his monumental work on *Die Cellularpathologie*. This was in part a compilation of papers already published in the *Archives* mentioned above, but also contained a full and complete statement of his theory. It is interesting to note that this work appeared about the same time as Darwin's *Origin of Species*, and these volumes immediately placed their writers in the front rank of their respective departments of biology. Virchow's theory started with the proposition that the cells of the animal body propagate themselves and that disease is the mechanical or chemical change produced in the cells by outside agencies. So long as the general equilibrium of the organism is not disturbed, the activities of the cell are physiological or normal, but when this is unbalanced the changes are pathological and disease results. Virchow's system was developed with great care from the basic idea *Omnis cellula e cellula*, and by elaborate investigation he demonstrated the truth of his conclusions and amplified the theory. He insisted that specific

stimuli produce specific results, and was opposed by some bacteriologists; but modern bacteriology has been brought into harmony with Virchow's pathological doctrines, and it is now realized that this science rests directly on the fundamental idea of the mechanical and chemical reaction to foreign stimuli on the part of the cells in the animal body. Through a long and useful career of university teaching and investigation, Virchow developed his theories and contributed extensively to the literature of pathology.

He was also a leader in other branches of science and is considered the founder of the modern German school of anthropology. Here he devoted himself to all the important branches of this science, including physical measurements, racial differences, ethnology, and archæology. He was instrumental in the formation of the Berlin Anthropological Society and of the *Berliner Gesellschaft für Anthropologie, Ethnologie, und Geschichten*, as well as in the establishment of the *Archiv für Anthropologie*. Naturally his views on anthropology were influenced by his pathological work, and much of the investigation put forward by zealous anthropologists failed to meet his critical view. His own researches were as numerous as they were varied. Such investigations as the peopling of the Philippines, the physical anthropology of the Germans, the American crania, etc., are typical of his versatility in this field.

As a statesman Professor Virchow was equally well known throughout Germany. He was an active Liberal, and was the leader of the party in the Prussian chamber, of which he was elected a member in 1862. As a member of the Reichstag from 1880 to 1893, he was ever consistent in asserting his Liberal ideas, and on one occasion he was challenged by Bismarck, but the duel never occurred. In 1887 he was deprived of the rectorship of the University of Berlin. A city councilor for forty-two years, he was active in everything pertaining to the physical and intellectual betterment of the city. Virchow has been called by the *Lancet* (London), "the father of rational pathology and the first initiator of a philosophic system of medicine." Among his many publications are: *Handbuch der speciellen Pathologie und Therapie* (3 vols., 1854-62); *Vorlesungen über Pathologie* (4 vols., 1862-67); *Ueber den Hungertyphus* (1868); and of a miscellaneous character, *Goethe als Naturforscher* (1861); *Ueber Pfahnbauten und Hünengräber* (1866); and *Die altnordischer Schädel zu Kopenhagen* (1871). The full title of his chief work is *Die Cellularpathologie in ihrer Begründung auf physiologische und pathologische Gewebelehre*.

VIRGINIA, a southern Atlantic State of the United States, has an area of 42,450 square miles. The capital is Richmond. The population in 1900 was 1,854,184, while in June, 1902, as estimated by the government actuary, it was 1,896,000. The populations of the largest cities in 1900 were: Richmond, 85,030; Norfolk, 46,624; Petersburg, 21,810; Roanoke, 21,495.

Finance.—The balance in the treasury on September 30, 1902, was \$1,029,800.72, and in addition to this, the United States direct tax fund had to its credit \$1,162.74. The total receipts for the fiscal year ending September 30, 1902, were \$3,795,093.42. The balance remaining from the previous year was \$854,490.92. The disbursements for the fiscal year were \$3,910,191.62, leaving a balance on September 30, of \$739,392.72. The total debt at the end of the fiscal year was \$27,046,475.53, of which \$26,837,472.83 was funded. During the year the debt was reduced by \$12,116.67.

Agriculture, etc.—According to the *Crop Reporter*, the principal farm crops of Virginia for 1902 were: Corn, 1,879,348 acres, 41,345,656 bushels, \$21,499,741; winter wheat, 637,806 acres, 3,635,495 bushels, \$2,872,040; oats, 222,074 acres, 3,886,295 bushels, \$1,632,244; potatoes, 50,531 acres, 3,789,825 bushels, \$2,198,098; hay, 472,913 acres, 501,288 tons, \$6,807,491; tobacco, 182,359 acres, 136,769,250 pounds, \$12,309,232. The coal mines along the western border of the State produced, in 1901, 2,725,873 short tons having a value at the mines of \$2,353,989. The 1902 output was below the normal, owing to the strike of the miners during the summer months. The production of pig iron increased from 217,819 tons in 1901, to 263,233 tons in 1902.

New Constitution.—The new constitution adopted after many months' debate by the constitutional convention which met in July, 1901, was proclaimed by the convention on May 29, 1902, and on June 29 Governor Montague issued a proclamation calling on the people to support the new instrument. The most important changes are those regarding the franchise, though many other changes are included, making the organic law more applicable to existing conditions. The old constitution gave the elective franchise to all citizens of twenty-one years or over who had resided in the State a year, and in the county, city, or town wherein they voted, for three months. The new constitution provides an elaborate elective schedule calculated to insure a vote to every white person and also to such other persons as shall show themselves possessed of the proper qualifications for citizenship. It provides for a general registration of all voters on or before October 15, 1902, and also on or before October 15, 1903. At such registrations males may register if twenty-one years of age and a resident of the State two years, of the county, city, or town one year,

RUDOLF VIRCHOW

and of the voting precinct thirty days; provided, however, that any such person (1) has served in time of war under the United States or the Confederate States, or under any State; or (2) is the son of such person; or (3) has paid in the preceding year at least one dollar in State taxes; or (4) is able to read any section of the constitution, or, if unable to read it, can understand and give a reasonable explanation of it. Registration officers were appointed by the convention from whose decisions appeal lay to the county court and from thence to the Supreme Court of Appeals; but all persons registered before January, 1904, are not to be required ever to register again. Persons registering after that date shall be required, if physically able, to make out in their own handwriting an application blank and must have paid an annual poll tax of \$1.50 for the three years preceding. Those also who register after January, 1904, shall, unless physically unable, themselves prepare their ballot, which is to be without any distinguishing mark or symbol, and to contain the names of the candidates and of the offices to be filled "in clear print and in due and orderly succession"; those who register before January, 1904, may be aided in the preparation of their ballots. For local elections not involving the election of members of the general assembly, the general assembly is authorized to prescribe a property qualification for voters not exceeding \$250. The assembly may also in its discretion "make such exemptions from the operation of said property qualification as shall not be in conflict with the Constitution of the United States." From these provisions it would appear that the convention had found itself able, without adopting all the rigor of the so-called "grandfather" clause of some of the other Southern States, to insure that all white citizens shall be duly enrolled, and thereafter so many negroes as may be deemed advisable; and that, furthermore, local elections shall not be disturbed by any undue preponderance of the negro vote which might possibly occur from advancing negro education.

Stringent provisions were made by the convention to check indiscriminate special legislation and to insure that no spoils bills be made law. The old constitution provided merely that a bill should not become law "until it had been read on three different days in the house in which it originated." The new constitution provides that all bills shall be referred to committees in each house and reported back; that they shall be read on three different days in each house, and that on their final passage a ye and nay recorded vote shall be taken. It is further provided that all amendments shall also be subject to a recorded vote, and that appropriation and tax bills and bills creating or continuing an indebtedness shall not be passed except upon an affirmative vote of a majority of all the members elected to each house. No law other than a general appropriation act is to take effect within ninety days of its passage unless by a four-fifths vote of each house. Special legislation is forbidden wherever a general act is applicable, and special acts dealing with many subjects are specifically prohibited. These subjects include such important matters as punishment for crime; the assessment or collection of taxes; the granting of pensions; the conduct of elections; the salaries of officials; the creating of private corporations and regulating labor, trade, mining, or manufacturing. A standing committee is to be created on all special, private, and local bills, and this committee must report upon all such bills before they can be referred to the special committees dealing with their subjects. The governor is given power to veto particular items of appropriation bills and to return bills with recommendations for amendment. A standing committee of five, two from the senate and three from the house, is to be appointed to examine annually or oftener the accounts of the first auditor, the state treasurer, and the secretary of the commonwealth.

The mayors of cities are given the same power to veto items of appropriation bills as is given to the governor, and as in the general assembly no bill appropriating or borrowing money or imposing taxes can pass the council (whether one or two chambered) without an affirmative vote of all the members elected thereto. No franchise laws or concessions of any public property can be granted for a longer period than thirty years, or unless assented to by a three-fourths affirmative vote of the council. Cities and towns are not allowed to issue bonds to a greater amount than 18 per cent. of the assessed value of the real estate taxed; but bonds issued for a water supply or other specific revenue-producing public utility are not to be included in computing the limit of the city's indebtedness, provided that within five years a revenue is returned from the bonds sufficient to pay the interest on them and provide for a sinking fund.

Conventions and Platforms.—The Democratic State Convention was held at Norfolk, August 14, 1902. The platform contained planks protesting against trusts and charging the Republican party with failure to enforce the laws now existing against commercial combinations. The Democratic State administration was commended; and the party pledged itself to improve the public schools and to develop further the fish and oyster industries of the State. The convention declared in

favor of a State law modifying the "fellow servant" doctrine so as to put responsibility for injuries to their employees upon the transportation companies.

The Republican State convention was held at Roanoke, August 22, 1902. The platform announced the opposition of the party in Virginia to criminal trusts and illegal combinations of capital. It was pointed out, however, that there was no feeling of antagonism against combinations of capital for legitimate purposes. In this connection, the leaders took occasion to point out that, according to their view, the Democratic party of the State, during fifteen years of power, had failed to enact any law or take any steps whatever to control, prevent, or punish any such trusts or illegal combinations of capital. Regarding local issues, the platform protested against discrimination between the white and colored races. It was declared that the suffrage provisions of the State constitution were satisfactory, and would remain so provided proper steps were taken to secure for the voters a free ballot and a fair count.

State Officers.—For 1903, elected for the four-year term ending February, 1906: Governor, A. J. Montague; lieutenant-governor, J. E. Willard; secretary of commonwealth, D. O. Eggleston; first auditor, Morton Marye; second auditor, John G. Dew; treasurer, A. W. Harman, Jr.; superintendent of free schools, J. W. Southall; attorney-general, W. A. Anderson—all Democrats.

Supreme Court of Appeals, in 1902 and 1903: President, James Keith; associate justices, Richard H. Cardwell, John A. Buchanan, George M. Harrison, and Stafford G. Whittle—all Democrats.

For congressional representatives, see UNITED STATES (paragraph Congressional Representatives).

VIRGIN ISLANDS. See LEEWARD ISLANDS.

VITAL STATISTICS. The death rate for the great capitals of Europe for 1900 (the last accessible figures) was as follows: London, 18.8 per 1000; Berlin, 18.7; Paris, 19.4; Vienna, 20.42; Moscow (approximately), 30.94. The large American cities show a death rate per 1000 as follows: New York, 19.95; Philadelphia, 18.26; Boston, 19.06; Chicago, 14.68; Montreal, 25.46. New York City had a death rate of 22.02 in 1901. There were 33,485 marriages, 80,735 births, and 70,808 deaths. Of the deaths, 8,295 came from the morgue, 3219 of which were children under five years of age, 3857 were due to accident, 701 suicide, 105 to homicide, and 1273 to sunstroke. Pneumonia killed 9128, tuberculosis 9396, and typhoid fever 729. Recent statistics show a marked decline in the English birthrate. Since 1881 the percentage of married women under forty-five having children has decreased from 27.4 to 20.06. This is most noticeable in the fashionable quarters of London, the statistics for the slums, Stepney, Shadwell, and Bethnal Green having remained stationary. Throughout the rest of England outside of London, the birthrate has fallen since 1881 from 30.3 per cent. to 25.8 per cent.

VIVEKANANDA. See SWAMI VIVEKANANDA.

VIVISECTION. During 1902 the anti-vivisectionists continued their crusade against all experiments upon living animals. It is admitted by the experimentalists, as well as their opponents, that in many cases vivisection is abhorrent, but the question nevertheless presents itself, Is humanity satisfied with the present attainments of medicine and surgery, or are surgeons and physicians expected to add to the total of scientific knowledge? Dr. E. Stuver, of Fort Collins, Colo., published during 1902 an article in which are tabulated some of the beneficent results from scientific experiments upon living animals, after years of disaster following empiric methods. Among these results are: the demonstration of the manner in which the blood nourishes the tissues; how the chyle is carried into the blood; the process of intestinal digestion; the difference between the motor and sensory functions of the spinal nerves; the action of the vagus and that of the cardiac sympathetic nerves from the thoracic spinal cord upon the heart; the formation of glycogen in the liver; the action of the vaso-motor nerves; localization of intra-cranial injuries or diseases; and the antiseptic treatment of wounds.

VOLCANOES. The year 1902 was one of extraordinary volcanic activity. The terrible disasters that befell St. Pierre and Georgetown were only incidents in a long series of disturbances—closely related in time if not in cause—which affected a vast area of the earth's surface. These disturbances first assumed a pronounced form with the earthquake of April 18, when a large part of southern Mexico and Central America was severely shaken and several towns in Guatemala suffered complete ruin. Shortly after this earthquake Mont Pelée and La Soufrière began to eject clouds of steam; the activity increased in violence until the fearful outbursts of May 7 and 8, following which there were periods of quiescence broken at short intervals by violent eruptions. On May 12 Mont Colima, near Guadalajara, Mexico, was unusually active, and on May 15 the volcano of Soconusco (Mexico) broke its long silence. Then followed the eruptions of Tocana (Guatemala) on June 8,

Piehincha (Ecuador) on June 21 and Santa Maria (Guatemala) on October 24—the last named causing widespread devastation; while without the localized area of disturbance comprising the West Indies and the Cordilleran region there were the eruptions of Mont Redoubt (Alaska) on May 9, Susygan (Caucasia) on June 4, Vesuvius on September 6, Stromboli on September 9, and Mangi Api (Samoa) on November 2. Full details as to many of these disturbances are not yet available and no accurate estimate of the devastation involved can be made. The year's record with three such cataclysms as those of Mont Pelée, La Soufrière, and Santa Maria occurring within the space of six months is unique in history.

The numerous contributions to current literature, both popular and scientific, witness the unusual interest that was taken in the study of volcanic phenomena. The scene of the West Indian eruptions was visited by a number of well-known scientists, many of them acting as representatives of American and British societies, and the disasters were described in great detail upon the basis of their investigations. A review of the literature fails to show, however, that any material advance was made towards confirming the existing theories of volcanism, at least so far as relates to origin, or that any new principles of importance were discovered. In fact one of the most obvious deductions from a study of the year's contributions is the rudimentary state of our knowledge concerning the ultimate cause and mechanism of volcanoes. This, of course, is due to the extreme difficulties surrounding the investigation of such a subject, which is likely to remain one of the mysteries of science for years to come. Yet, as has been pointed out by Professor Milne and others, there are several more or less related problems—the slow movements of the earth's crust, earthquakes, magnetic changes, and escape of heat from the earth's interior—concerning which much might be learned that would be valuable not only in extending our knowledge of the genesis of volcanic activity, but in enabling us to forecast its manifestations. Sir Charles Lyell has stated in connection with the eruptions of Vesuvius that the local upheavals near the Bay of Naples appear to be synchronous with volcanic outbursts, while periods of subsidence are marked by quiescence. The distribution of volcanoes along the great ridges or folds of the earth's crust, where earthquakes most frequently originate, is indicative of a close relation between the two classes of phenomena, and consequently it would be desirable to obtain records as to the location, character, and propagation of seismic disturbances for long periods and upon a broader scale than has hitherto been attempted. Another subject that might be investigated with valuable results is the possible relation between volcanic activity and changes in magnetic elements. The concurrence of such changes with the outbreak of Mont Pelée on May 8 was noted at magnetic stations in the United States, Hawaiian Islands, and Europe.

The synchronism of the eruptions in the West Indies and in the adjacent portions of the American continents suggests that some extraordinary and far-reaching disturbance was in progress, which acted as a proximate cause. In this case there is no good reason for believing that the volcanic forces have yet been exhausted, although periods of inactivity may intervene. See GUATEMALA, MARTINIQUE, and ST. VINCENT.

VOLUNTEERS OF AMERICA, an undenominational organization, incorporated in 1896, that conducts religious, philanthropic, and economic work. Its activities are administered under a military system, including 6 regiments, 14 companies, and nearly 100 self-supporting posts, besides outposts, which raised in their own support during the past year \$86,820. Nearly 4,000,000 persons attended the various meetings of the Volunteers, and their officers visited 30,522 families. The homes for destitute men and for workingmen—in Chicago, Pueblo, Joliet, Kansas City, New York City, Brooklyn, Lowell, Worcester, Lynn, Auburn, Toledo, Erie, Philadelphia, and other cities—lodged 252,760 men, and in the restaurants 344,450 persons were fed; the Homes of Mercy in Newark, N. J., and Boston, Mass., provided 2760 beds for young women and permanently cared for 385—the homes for unprotected and neglected children received 426 children, and special efforts are being made to establish another institution of this character; the prison work, carried on in 16 State prisons with 14,000 inmates, reached by correspondence some 22,000 men, and there are Hope Halls in Chicago and Flushing, the latter owned by the Volunteers, which accommodate, respectively, 60 and 80 men; through the tenement work, 1140 families in New York and vicinity alone have been visited and aided. The *Volunteer Gazette* is published weekly at the headquarters in Cooper Square, New York City. President and General, Ballington Booth.

WARE, EUGENE FITCH, a poet and lawyer, was appointed commissioner of pensions by President Roosevelt on April 11, 1902, to succeed Henry Clay Evans (q.v.). Mr. Ware was born at Hartford, Conn., May 29, 1841, and was educated in the public schools of Burlington, Iowa. He served during the Civil War in the First Iowa Infantry, and the Seventh Iowa Cavalry, finally becoming captain in the

latter, and also in the Indian wars, where he was seriously wounded. After leaving the army, he moved to Fort Scott, Kan., and in 1871 was admitted to the bar. He was elected to the State senate, and was twice a delegate to the Republican national convention. He was also a candidate for the United States House of Representatives, but was defeated. Mr. Ware is best known by his pseudonym of "Ironquill," under which name he has written many poems of a patriotic or humorous nature. In late years he has lived in Topeka, Kan.

WARREN, GEORGE WILLIAM, an American organist and professor of music, died in New York City, on March 16, 1902. Born September 17, 1828, at Racine, Wis., where he studied music in Racine College, he removed to Albany, N. Y., and for a time was there a member of a hardware firm. After further musical study he was organist at Albany successively of St. Peter's and St. Paul's. From 1860 to 1870 he was organist of the Church of the Holy Trinity in Brooklyn, and from 1870 until his retirement as organist emeritus of the parish in 1900, was organist of St. Thomas's Church in New York. He also held appointment as professor of music in Columbia University. His compositions include sacred music for organ, and various piano pieces.

WASHINGTON, a Pacific coast State of the United States, has an area of 69,180 square miles. The capital is Olympia. Washington was organized as a Territory March 2, 1853, and was admitted to statehood November 11, 1889. The population in 1900 was 518,103, and in June, 1902, as estimated by the government actuary, 551,000. The populations of the three largest cities in 1900 were: Seattle, 80,671; Tacoma, 37,714; Spokane, 36,848.

Finance.—There was on hand in the treasury of the State of Washington at the beginning of the biennial term ending September 30, 1902, \$426,001.39. The total receipts from all sources during the two years were \$7,149,381.44, and the disbursements \$6,663,308.89, leaving a balance on September 30, 1902, of \$912,073.94. Of the total receipts \$2,687,328.87 were turned into the general fund as applicable to the ordinary governmental expenses, and \$2,434,054.63 were turned into the current school fund. The main items of both these funds were derived from a general State property tax. The total indebtedness of the State on September 30, 1902, was \$1,344,739.94, of which \$1,225,000 represented bonds. During the biennial period the debt was reduced \$131,222.34.

Agriculture.—The principal farm crops of Washington for 1902, according to the *Crop Reporter*, were: Winter wheat, 308,315 acres, 7,923,696 bushels, \$5,150,402; spring wheat, 757,139 acres, 15,748,491 bushels, \$10,236,519; oats 154,006 acres, 7,115,077 bushels, \$3,486,388; barley, 140,075 acres, 6,121,278 bushels, \$2,815,788; potatoes, 31,288 acres, 4,225,168 bushels, \$1,616,964; hay, 322,864 acres, 739,359 tons, \$6,602,476. Statistics of farm animals in the State, January 1, 1903, were as follows: 216,988 horses, value \$13,187,130; 2251 mules, \$156,939; 141,701 milch cows, \$5,462,574; 309,009 other cattle, \$6,893,804; 1,146,583 sheep, \$3,330,708; and 181,326 swine, \$1,505,006. The total product of the fisheries in 1902 was \$6,731,870—not quite equal to the 1901 output. The salmon catch was valued at \$3,889,185, of which 382,704 cases were packed on the Columbia River, and 663,582 cases on Puget Sound. The oyster catch was estimated at \$296,750. The fish commissioner reported the capital invested in the fisheries of the State in 1902 amounted to \$6,819,218. There were 10,695 employees earning \$2,501,650. The value of coal output at the mines for 1902 was \$5,300,854. Lumber shipments during the first eleven months of 1902 amounted to 479,715,877 feet, as compared with 406,715,362 feet shipped during the corresponding period in 1901. Flour trade with the Orient developed rapidly. During July-December, 1902, 1,102,311 barrels were shipped to Asiatic ports.

Conventions and Platforms.—The Republican State convention was held at Tacoma on September 10. The platform indorsed the President in the following words: "The Republicans of the State of Washington are in sympathy with you in your brave stand for the common people of the United States, and pledge to Theodore Roosevelt their support and votes for 1904." The governor of the State was also indorsed, and the passage of laws requiring the adoption of safety appliances in mills and factories, looking to the improvement of State roads, and the enactment of an eight-hour law for State work was urged.

The Democratic State convention was held at Tacoma on September 17. The convention indorsed the Kansas City platform and opposed imperialism and colonialism, government by injunction, trusts, and "trust-fostering tariffs." It condemned "special privileges given for grazing sheep on government forest reserves," demanded complete exclusion from all American territory of all Chinese, and denounced the Republican majority in Congress for "passing the present weak and inadequate law."

Elections.—At the election held November 4, 1902, the Republican candidate for justice of the Supreme Court was elected, the vote being Hadley (Rep.), 59,017;

Reavis (Dem.), 32,544, giving Hadley a plurality of 26,473. The State legislature for 1903 will consist of 33 Republicans and 9 Democrats in the senate, and 81 Republicans and 13 Democrats in the house.

State Officers.—For 1902 and 1903: Governor, Henry G. McBride (formerly lieutenant-governor, succeeded to office upon the death of Gov. John R. Rogers, term expires January, 1905); secretary of state, S. H. Nichols; treasurer, C. W. Maynard; auditor, J. D. Atkinson; attorney-general, W. B. Stratton; superintendent of education, W. B. Bryan; commissioner of public lands, S. A. Calvert—all Republicans.

Supreme Court.—Chief justice, J. B. Reavis; associate justices, R. O. Dunbar, T. J. Anders, Mark A. Fullerton, Wallace Mount, H. E. Hadley and W. H. White—all Republicans. The last two were appointed October 7, 1902, to fill out unexpired terms.

For congressional representatives, see UNITED STATES (paragraph Congressional Representatives).

WATER GAS. See GAS, ILLUMINATING AND FUEL.

WATER PURIFICATION. The year 1902 saw work begun at Philadelphia on the largest single water filtration plant yet attempted. It will have a capacity of 200,000,000 gallons a day, and if certain new methods being installed at a smaller plant in Philadelphia prove as successful as is expected, some 40,000,000 gallons a day may be added to the capacity mentioned. This immense plant is located at Torresdale, Pa., near the Delaware River, water from which it is designed to purify. A long tunnel deep down in the rock will convey the filtered water to the city. The filters are to be of the slow sand filtration type, like those which have proved so successful at London, Berlin and many other European cities, and at Albany, N. Y.; Lawrence, Mass., and elsewhere in this country. The filters at Philadelphia are to have concrete floors, columns, side walls and roofs. A small plant of similar construction was put in use at Philadelphia late in 1902, and two others, besides the one at Torresdale, are also being built. Altogether the city will have a daily filtering capacity of about 300,000,000 gallons. Some water will be taken from the Schuylkill as well as from the Delaware River. The former contains much coal dust at times, and both carry more or less other matter in suspension. To relieve the filter beds from clogging, some of this suspended matter will be removed by sedimentation. A preliminary, or roughing, filter is to be built at one of the smaller plants to still further relieve the filter beds. This preliminary plant will be of a new type and will operate at a relatively high rate.

A contract for a large slow sand filtration plant was let at Providence, R. I., during 1902, and plans for similar filters for Washington, D. C., were completed toward the end of the year; and bids for construction, to be opened only in 1903, were invited. A large mechanical filtration plant was completed in 1902, at Little Falls, N. J. Water from it will be supplied to Paterson, Passaic and other New Jersey towns. These works were built by the East Jersey Water Company, with Mr. Waldo F. Smith, of Paterson, as chief engineer, and Mr. George W. Fuller, of New York City, as consulting engineer. They differ from previous mechanical filters in that the filter tanks are rectangular, instead of round, and are made of concrete, instead of steel or wood. Air will be used to assist the washing of the filtering material. Another notable mechanical filter plant under construction in 1902 was the one at Louisville, Ky. It is in some respects similar to the one at Little Falls, but the filter tanks are much larger, and the filtering material will be stirred up, when washed, by an apparatus lowered from above, and mounted on an overhead carriage.

Of the 1524 cities and towns which by the United States census of 1900 had populations of 3000 and upwards, there were, early in 1902, 1475 that reported water-works, and of the latter 311 stated that some means were employed to improve the character of their water supplies. Omitting 68 places that merely reported the water "filtered," there still remain 243, out of 1475 water-works that report purification. These plants are classified as follows: Mechanical filters, 141; slow sand filters, 21; sedimentation basins, 53; filter galleries, 14; filter cribs, 11; softening plants, 2; aerating plants, 5; total, after deducting duplicates, 243. This summary takes no account of the relative efficiency of the various plants, individually or by classes. The sedimentation basins are chiefly for classification, and some of the filter galleries and filter cribs were built to develop underground supplies, just as a well might be sunk for that purpose, rather than to improve an undesirable water. Many of the mechanical filters were put in to clarify water, and only incidentally, if at all, with a view of removing dangerous bacteria. Most of the slow sand filters are in the New England and Middle States, and many of the mechanical filter plants are located on the turbid streams of the South and central West. Further particulars are given in *The Municipal Year Book* (New York, 1902).

WELLESLEY COLLEGE, for the higher education of women, at Wellesley, Mass., founded 1875, had an attendance of 884 during the academic year 1901-02, and a faculty of 86. The gross income was \$289,669, and gifts to the university of \$13,000 were received. The library numbered 54,066 volumes. In 1902 Mr. J. D. Rockefeller promised to give the college \$150,000 for a central heating plant and other purposes, provided an equal amount should be secured by the institution from other sources for general endowment.

WELLS COLLEGE, an undenominational college for women at Aurora, N. Y., had in 1902 a faculty of 22 and 115 students. Its library contained 10,664 volumes. Gifts to the amount of \$93,000 were received for the erection of three new buildings; a gymnasium, a recitation and administration hall, and a hall for physics and chemistry, to be built during 1903. The number of applicants for admission was largely increased, and the college appears to be entering on a new career of prosperity.

WENCKEBACH, CARLA, professor of the German language and literature at Wellesley College, and author of many widely-used school and college text-books, died December 29, 1902. She was born in Hildesheim, Germany, February 14, 1853, and after study at the Hanover Normal School and at the universities of Zurich and Leipzig, had a varied experience as teacher in England, Belgium, Russia, and in New York City. In 1883 she was made instructor in German at Wellesley College, and two years later became professor.

WESLEYAN METHODIST CONNECTION OF AMERICA, organized in 1843, now has 516 churches, with about 700 ministers and a membership approximating 17,000. It controls two educational institutions, including Houghton Seminary at Houghton, N. Y., and is represented by an official organ, the *Wesleyan Methodist*, published in Syracuse, N. Y. During the year 1902 appeared a history of the church by the Rev. A. T. Jennings. The next general conference of the denomination will be held in the fall of 1903.

WESLEYAN UNIVERSITY, a Methodist Episcopal institution for both sexes, Middletown, Conn., founded 1831, had in 1902 325 students and a faculty of 35 members. The library had 63,000 volumes. The gross income available for current expenses was \$116,535, and in addition gifts were received amounting to \$58,350. Work was begun on the Wilbur Fisk Recitation Hall to cost about \$120,000, raised by subscription, and on the Scott Physical Laboratory, the gift of Charles Scott and Charles Scott, Jr., in memory of John B. Scott, of the class of 1881, who was killed in the Spanish War. Preparations were begun for the celebration of the two hundredth anniversary of the birth of John Wesley, in whose honor the college was named. The celebration will occur in connection with the commencement in 1903.

WESTERN AUSTRALIA, the largest state in the Commonwealth of Australia, has an area of 975,920 square miles, and a population, according to the census of 1901, of 182,553, as compared with 49,782 in 1891, an increase of over 264 per cent. On June 30, 1902, the population was stated at 208,322. Perth, the capital and largest town, has 40,000 inhabitants. Primary education is compulsory and free. The expenditure of the state on education in 1902 was £102,359.

Government and Finance.—The executive power is exercised by a governor appointed by the crown and assisted by a responsible ministry. The legislative power is vested in a legislative council of 30, elected for six years on a property qualification basis, and a legislative assembly of 50, elected for three years by universal adult suffrage (including women). The state revenue increased from £3,708,034 in 1901 to £3,688,049 in 1902, and the expenditure from £3,165,244 to £3,490,026. The surplus, however, is said to be due to the fact that the state is still allowed to collect a certain portion of her border customs. The public debt increased during the year from £12,709,430 to £14,942,310.

Industries, Commerce, etc.—Western Australia is the chief gold producing state in the Commonwealth. The output in 1901 was 1,879,390 ounces—the largest on record—but the production for 1902, which reached 1,790,490 ounces in the first ten months, gave promise of being considerably in excess of even that amount. Agriculture is backward, owing to lack of sufficient laborers and transportation. Wheat and hay are at present the only crops of any importance. Forest and live-stock products are of growing importance, and, in addition to gold, there are mined silver, tin, coal, lead, and copper. Commerce is in a flourishing condition, the imports having increased from £5,962,178 in 1901 to £6,454,171 in 1902 and exports from £6,852,054 to £8,515,623. The exports to Great Britain in the latter year amounted to £5,625,459. The exports in order of value are gold, timber, wool, pearls and pearl shell, copper, and sandal wood.

History.—The Hon. George Leake, who became premier of the state in December, 1901, died on June 24, 1902, and a new ministry was formed as follows: Premier and attorney-general, Walter Hartwell James; colonial secretary and minister of education, Walter Kingsmill; minister of mines, Henry Gregory; commissioner

of lands, Adam Jameson; minister of public works and railways, Cornthwaite Hector Rason; colonial treasurer, James Gardiner. The parliament was opened July 17 by Sir Arthur Lawley, who congratulated the members on the exceptionally prosperous condition of the state. The depression that was so evident in other Australian states was scarcely noticeable in Western Australia. There had been little suffering from the drought, 208 miles of irrigation pipes had been laid, and the construction of the system was only fairly begun. Immigration had increased steadily, and activity in the mining districts was greater than ever. In August, 1902, Sir Arthur Lawley was appointed lieutenant-governor of the Transvaal, and was succeeded in Western Australia by Sir Albert Edward Stone.

WESTERN RESERVE UNIVERSITY, Cleveland, O., founded 1884, had in 1902 a faculty of 153 members and a student body of 780 in all departments. The gross income was \$258,000. The library contained 48,000 volumes. Gifts to the amount of \$245,000 were received during the year. A gift of \$100,000 by Mr. Andrew Carnegie was announced for the purpose of founding a school for the training of librarians. The school will be organized as a department of the university on an equality with the other post-graduate departments. The Florence Harkness Memorial Chapel and Haydn Hall were dedicated, the latter chiefly for dormitory purposes. The chapel contains, besides the nave seating about 600, a room for the Biblical library and a lecture room for the department of Biblical literature. The main building of Adelbert College was thoroughly reconstructed at a cost of about \$100,000.

WEST INDIES, the name given to the archipelago stretching in a great quarter circle from the mouth of the Orinoco in South America to the Straits of Florida, and inclosing the Caribbean Sea. The area is estimated at more than 90,000 square miles and the population at 5,000,000. The principal products include sugar, fruits, tobacco, cacao, maize, guava and ginger. The year 1902 was an eventful one for the West Indies in more ways than one. It witnessed one of the most stupendous volcanic cataclysms of history in the eruption of Mont Pelée on the island of Martinique (*q.v.*) and the upheaval of the volcano of La Soufrière on the island of St. Vincent (*q.v.*). Politically the year was marked by the entrance of Cuba (*q.v.*) as an independent republic among the states of the world. Of lesser interest were successful revolutions achieved in the republics of Haiti and Santo Domingo (*qq.v.*) on the island of Haiti. The political aspect of the islands is a conglomerate one with the United States, Great Britain, France, and Denmark as territorial possessors therein, in addition to the independent islands of Cuba and Haiti. The West Indies have become important to the United States, now that the construction of an isthmian canal has been determined upon. To guard the entrance to the canal the United States should occupy a vantage ground on the islands. The long delayed acquisition of the Danish West Indies (*q.v.*) may be but a step. In Jamaica and Trinidad in this direction dissatisfaction with British rule will on occasion (as in 1902) express itself in the form of a discussion as to the benefits to be gained by annexation to the United States. In addition to the names for which references are given above, see **BAHAMAS**; **BARRADOS**; **CURACAO**; **GADELOUPE**; **JAMAICA**; **LEEWARD ISLANDS**; **PORTO RICO**; **TRINIDAD**; and **WINDWARD ISLANDS**.

WEST POINT, UNITED STATES MILITARY ACADEMY AT. See **MILITARY ACADEMY, UNITED STATES**.

WEST VIRGINIA, a central eastern State of the United States, has an area of 24,780 square miles. The capital is Charleston. The population in 1900 was 958,800, and in June, 1902, as estimated by the government actuary, 1,004,000. The largest city in 1900 was Wheeling, with a population of 38,878.

Finance.—The balance in the treasury of the State on October 1, 1901, was \$1,108,046.36. The total receipts during the year were \$2,292,162.10, and the total disbursements \$2,147,160.57, leaving a balance in the treasury on September 30, 1902, of \$1,253,047.89. The largest items of revenue during the year were: From the State tax, \$563,660.50; from the license tax, \$202,475.50; from the license tax on charters, \$375,560.46; from the railway tax, \$447,694.26, and from the school tax, \$391,935.60. The total revenues received were apportioned among the funds as follows: To the State fund, \$1,710,765.12; to the general school fund, \$493,085.47; and to the school fund, \$88,311.51. It was stated by the treasurer that the financial conditions of the State were the best in its history; the new corporation law passed by the legislature of 1901 having largely increased the revenues. West Virginia has no debt.

Agriculture and Industries.—The principal farm crops of West Virginia for 1902, according to the *Crop Reporter*, were: Corn, 774,061 acres, 20,512,616 bushels, \$11,076,813; winter wheat, 356,264 acres, 2,743,233 bushels, \$2,249,451; oats, 85,614 acres, 2,448,560 bushels, \$1,003,910; potatoes, 32,192 acres, 3,090,432 bushels, \$1,576,120; hay, 517,644 acres, 579,761 tons, \$8,307,975; tobacco, 4676 acres, 2,969,260 pounds, \$286,004.

A general strike on June 7, 1902, suddenly reduced the output of the coal mines 80 per cent., and it was late in the autumn before they were again in full operation. Fifty new mines were opened in 1902, making a total of 450 commercial mines. Five different railroads were building spurs in the coal regions during the year. A large coal area was made accessible by making the Monongahela River navigable up to Fairmont. One of the most important transfers of property was the purchase by the Gould interests of the coal fields owned by the Davis Coal and Coke Company and the West Virginia Central and Western Maryland railroads. The coke produced in the year ending June 30, 1902, was 2,249,744 short tons—a product exceeded only by Pennsylvania. The report of the mine inspector for the fiscal year 1902 showed 35,157 men employed at the mines and coke ovens. At the end of the calendar year 1902 several large companies advanced wages 10 per cent. The natural gas produced in 1901 was valued at \$3,954,722. In 1902 there was a considerable increase in the use of the gas in glass-making. Railway construction during the year amounted to 92.13 miles.

Political.—The election in 1902 was for representatives to Congress and to the State legislature. Several amendments to the State constitution were also voted upon. One of these changed the office of secretary of state from the appointive to the elective class. A second proposed amendment provided that the salaries of the principal executive officers of the State should be increased. These salaries have heretofore been fixed by the constitution. A third proposed amendment strikes out the constitutional provision for registration and substitutes the words "no citizen shall be denied the right or privilege of voting at an election because his name is not or has not been registered or listed as a qualified voter."

State Officers.—For 1902 and 1903: Governor, A. B. White (elected for 4 years, term ending March, 1905); secretary of state, W. M. O. Dawson; treasurer, Peter Silman; auditor, A. C. Scherr; attorney-general, R. H. Freer; superintendent of schools, T. C. Miller; commissioner of agriculture, J. O. Thompson; commissioner of labor, J. V. Barton—all Republicans.

Supreme Court of Appeals in 1902 and 1903: President, Henry Brannon; associate judges, M. H. Dent, H. C. McWhorter, George Poffenbarger—all Democrats except McWhorter, Republican.

For congressional representatives, see UNITED STATES (paragraph Congressional Representatives).

WHEAT. As stated by the United States Department of Agriculture, the world's wheat crop in 1901 was as follows:

Countries.	Bushels.	Countries.	Bushels.	Countries.	Bushels.
United States.....	748,460,000	Canada	90,288,000	Japan.....	20,000,000
Russia.....	468,071,000	Argentina	74,783,000	Persia.....	15,200,000
France.....	304,210,000	Roumania.....	72,388,000	Belgium.....	12,920,000
British India.....	245,781,000	Australasia.....	56,610,000	Servia.....	10,000,000
Austria-Hungary.....	184,216,000	United Kingdom.....	55,581,000	Mexico.....	9,000,000
Italy.....	147,560,000	Turkey.....	52,000,000	Chile.....	9,000,000
Spain.....	108,000,000	Africa.....	45,400,000	Other countries.....	28,774,000
Germany.....	91,817,000	Bulgaria.....	24,000,000		
		Total.....			2,872,197,000

This is about 300,000,000 bushels more than were produced in 1900, but 130,000,000 bushels less than in 1898.

The wheat crop in the United States in 1902 was 670,063,000 bushels, valued at \$422,224,117, or about 63 cents per bushel. This crop was grown on 46,202,424 acres, the average yield being 14½ bushels per acre. In the principal wheat-growing States the crop was as follows:

	Acreage.	Bushels.	Dollars.		Acreage.	Bushels.	Dollars.
Pennsylvania.....	1,558,745	24,693,171	17,973,565	Missouri.....	2,827,462	56,268,494	32,634,587
Maryland.....	737,000	11,193,223	8,013,041	Kansas.....	4,395,319	45,827,495	25,205,122
Texas.....	959,253	8,633,277	6,647,623	Nebraska.....	2,525,150	52,726,451	25,835,911

Michigan.....	1,056,114	18,693,218	12,896,320	North Dakota.....	3,954,229	62,872,241	38,405,900
Indiana.....	2,217,778	35,484,446	24,129,425	Washington.....	1,065,454	23,671,187	15,381,921
Illinois.....	1,821,287	32,601,932	19,238,140	California.....	2,052,679	22,374,201	17,899,381
Minnesota.....	5,737,593	79,732,404	48,648,066	Oklahoma.....	1,087,747	12,073,992	7,002,915
Iowa.....	1,174,691	14,869,245	7,178,085				

The wheat crop of Russia in 1902 is reported to be considerably larger than in 1901.

As reported by F. H. Hitchcock, chief of division of foreign markets, the exports of wheat and wheat flour from the United States during the year ended June 30, 1902, were as follows.

WHEAT.			WHEAT FLOUR.		
COUNTRIES TO WHICH EXPORTED.	Bushels.	Dollars.	COUNTRIES TO WHICH EXPORTED.	Barrels.	Dollars.
United Kingdom.....	77,544,418	55,399,968	United Kingdom	9,059,722	34,818,702
Germany	19,725,674	14,944,074	Netherlands	1,404,247	5,455,083
Netherlands	16,970,033	12,825,406	Hongkong	1,308,893	4,164,693
Belgium	15,662,238	11,907,651	Germany	703,470	2,773,836
Canada	7,134,094	5,257,808	Brazil	544,145	2,187,352
France	3,324,015	2,491,393	Cuba	589,556	2,135,479
Denmark	2,920,534	2,242,806	British West Indies ..	540,973	2,049,935
Portuguese Africa	2,846,768	1,736,569	British South Africa ..	411,153	1,444,460
Portugal	2,336,955	1,468,798	Japan	440,435	1,279,880
British South Africa ..	1,439,067	1,050,151	Other countries.....	2,654,604	9,352,554
Other countries	4,952,314	3,541,596			
Total.....	154,856,102	112,875,222	Total	17,759,203	65,661,974

The imports of wheat were 118,612 bushels (valued at \$78,640), of which 102,435 bushels were from Canada and 14,565 bushels from Russia; the imports of wheat flour were 420 barrels (valued at \$2610), of which 391 barrels were from Canada.

WHEELOCK, JEROME, an American engineer, the inventor of the "Wheelock engine," died February 26, 1902, at Worcester, Mass. He was born June 20, 1834, in Grafton, Mass. Beginning as a mechanic he afterwards became an engineer, and then engaged in the manufacture of a cylinder packing which he had invented. He also invented the valves which were the main feature of the engine known by his name. The Wheelock engine was awarded the great gold medal of progress by the American Institute, New York, in 1875; the medal and diploma of the Centennial Exhibition in 1876, and the grand prize at the Paris International Exposition of 1878. He made a great success of the manufacture of the engine, which was used all over the world.

WHIPPLE, WILLIAM DENISON, brevet major-general, U. S. A., died April 2, 1902, in New York City. He was born August 2, 1826, at Nelson, N. Y., and graduated at West Point in 1851. Assigned to service on the Indian frontier in 1857, he participated in the Gila expedition against the Apaches, in 1858 in the Navajo expedition, and in 1860 in the defense of Fort Defiance, New Mexico. In the Civil War he was attached to Colonel Hunter's division in the Manassas campaign, was engaged in the battles of Bull Run, Missionary Ridge, Resaca, Kennesaw Mountain, and in the operations about Chattanooga. In 1863 he became brigadier-general of volunteers, and afterwards received the brevet of a major-general in the regular service. During and after the war he served in the adjutant-general's department, and was retired in 1887.

WHITE, EMERSON ELBRIDGE, an American educator, died October 21, 1902, at Columbus, Ohio. He was born January 10, 1829, in Mantua, Ohio; graduated at Western Reserve University, was commissioner of common schools of Ohio from 1863 till 1866, president of Purdue University from 1876 till 1883, and in the latter year removed to Cincinnati, where he engaged in literary work and was superintendent of public schools in 1886. His text-books, especially of arithmetic, have been widely used in the United States.

WHITFORD, WILLIAM CLARKE, an American educator, died in Milton, Wis., May 21, 1902. He was born at Edmeston, N. Y., May 5, 1828; graduated from Union College in 1853, and three years later from the Union Theological Seminary. For two years he held the pastorate of a Seventh Day Baptist church in Milton, Wis., and in 1858 became president of Milton College, an office in which he served until his death. From 1867 to 1875 he was a regent of the Wisconsin State normal schools, and from 1878 to 1881 superintendent of public instruction in that State. He published many volumes on religious and educational subjects.

WHITTLE, FRANCIS MCNEECE, Protestant Episcopal bishop of Virginia, died in Richmond, Va., June 18, 1902. He was born in Mecklenberg County, Va., July 7, 1823, and in 1847 graduated at the Virginia Theological Seminary in Alexandria. After pastoral charges in Kanawha, Va.; Northam, Va.; Berryville, Va., and Louisville, Ky., he was consecrated assistant bishop of Virginia in 1868, and in 1876 succeeded Bishop Johns as bishop. He received in 1873 the degree of LL.D. from William and Mary College.

WILLIAMS COLLEGE, Williamstown, Mass., founded 1793, had in 1902 an attendance of 423, a gain of 30 over 1901, and the faculty numbered 31. The income for the year was \$110,130. The promise of a new chapel, to cost \$100,000, the gift of Mrs. Thompson, was announced. A new department, of government, was established, to be opened in the spring of 1903. The library contained about 48,000 bound volumes.

WILSON, JOSEPH MILLER, an American engineer and architect, died in Philadelphia, Pa., November 24, 1902. He was born at Phoenixville, Pa., June 20, 1838; graduated in 1858 at the Rensselaer Polytechnic Institute at Troy, N. Y., and in 1860 became identified with the engineering staff of the Pennsylvania Railroad, of which he remained a member until 1886, as an assistant engineer (1860-63), as resident engineer of the middle division (1863-65), and then as a superintendent of bridge construction on the main line. As an architect he designed a large number of railroad stations and miscellaneous structures, the Reading terminal station, the Drexel Institute, and the Drexel Building, in Philadelphia, and aided in the designing of the main building and machinery hall at the Centennial Exposition of 1876. He was consulting engineer in many important enterprises throughout the eastern States, and rendered valuable service as a member of the board of experts which, under the direction of the New York Rapid Transit Commission, investigated the practicability of an underground railroad for New York City. He was a member of many scientific societies and contributed widely to their journals.

WILSON, WOODROW, an American publicist, installed president of Princeton University, October 25, 1902, was born December 28, 1856, in Staunton, Va. He graduated from Princeton in 1879, and studied law during the following year at the University of Virginia. He began the practice of law in Atlanta, Ga., took the degree of doctor of philosophy at Johns Hopkins University in 1885, and in the same year became professor of history and political economy at Bryn Mawr College. In 1888 he accepted a professorship at Wesleyan, and in 1890 returned to Princeton as professor of jurisprudence and politics. His unanimous election to the presidency of the university, on the resignation of Francis L. Patton, was a signal departure from the policy of considering a layman ineligible for the office. He has published: *Congressional Government, A Study in American Politics* (1885); *The State; Elements of Historical and Practical Politics* (1889); *Division and Reunion, 1829-1889* (1893); *An Old Master, and Other Political Essays* (1893); *More Literature, and Other Essays* (1893); *George Washington* (1896); *Colonies and Nation, A Short History of the People of the United States* (1901); and *History of the American People*, 5 vols. (1902).

WINDWARD ISLANDS, the most southerly group of the British West Indies, constitute a colony comprised of the islands of Grenada and the Grenadines, St. Lucia, and St. Vincent. Barbados (*q.v.*), a separate colony, and Tobago, attached to Trinidad (*q.v.*) administratively, also belong to the Windward group. The Windward Islands colony proper has a total area of 524 square miles and a population (1901) of 160,881. There is one governor for the colony and a joint court of appeals with Barbados, but no federal organization as in the Leeward group, nor is there a common tariff or treasury. St. George, Grenada, is the seat of government, and the residence of the governor, Sir Robert Baxter Llewelyn. The Grenadines are divided for administrative purposes between Grenada and St. Vincent.

Grenada has an area of 133 square miles, and a population, including some of the Grenadines, of 64,288. The chief town, St. George, has a population of 5000. The finances of the colony are in good condition, the revenue amounting, in 1901-02, to £70,075, and the expenditure to £65,990. The public debt, reduced by £3900 during the year, stands at £123,670. The land is fertile and the forests are rich in valuable timbers. The imports in 1901-02 amounted to £246,567, and the exports to £303,934. The principal articles of export are cacao, the value of which, in 1901, was £265,979; nutmegs (£21,044), spices, sugar and coffee.

St. Lucia, the largest island of the Windward group, has an area of 233 square miles and a population (1901) of 50,237. The chief town is Castries, with a population of 8000. The revenue (1901-02) amounted to £67,365, and the expenditures to £67,486. The debt is £175,780. The imports fell from £403,502 in 1900-01 to £382,652 in 1901-02, and the exports from £229,436 to £188,067. The principal exports were sugar (10,879,800 pounds in 1901), molasses and cacao.

St. Vincent is treated under its own title.

WINNER, SEPTIMUS, an American song-writer, died in Philadelphia, Pa., November 23, 1902. He was born in Philadelphia, May 11, 1827, and after studying many instruments began to teach music at the age of twenty. In 1847 he joined the Musical Fund Orchestra as first violinist, remaining a member for ten years, and in 1853 opened a music store in Philadelphia, where, until his death, he was in close touch with that city's musical affairs. Under pseudonyms like "Alice Hawthorne," "Percy Guyer," "Mark Mason," and "Paul Stenton," he composed the words and music of "How Sweet are the Roses" (1850), "What Is Home Without a Mother?" (1854), "Listen to the Mocking Bird" (1855), and other songs and ballads that were sung throughout the United States a generation and a half ago; and his patriotic songs, "Give Us Back Our Old Commander," which caused his imprisonment for criticising the removal of General McClellan from the command of the Army of the

Potomac, and "God Save Our President," written during President Garfield's illness in 1881, had a wide popularity. He was also known for his "Gems of the Opera," and other similar collections which he compiled.

WIRELESS TELEGRAPHY. The progress made in wireless telegraphy during the year 1902 was mainly in the direction of extending its range and improving the apparatus rather than in devising new methods. In nearly every country of the world wireless telegraphy is now in actual commercial or military use on a more or less extensive scale, or is in process of experimentation. Many investigators are at work attempting to improve and perfect the various parts of the apparatus, which is now of a complex nature. The most important event of the year was the actual transmission of messages between the Marconi stations at Glace Bay, Cape Breton, and Poldhu, Cornwall. The first actually complete message was sent on December 21, 1902, from Lord Minto to King Edward, and was followed by numerous others of a congratulatory nature, transmitted in both directions. It will be remembered that in the latter part of 1901 Mr. William Marconi announced that he had sent the signal S from Cornwall to America. The continued improvement in apparatus and methods during 1902 brought about the desired result. Aside from this work Marconi's most notable achievements were on the steamship *Philadelphia*, in March, and on the *Carlo Alberto*, a cruiser of the Italian navy, on which his apparatus had been installed. On the *Philadelphia* Marconi was able to receive and return messages up to a distance of 1551 miles, while on the *Carlo Alberto* signals were received over stretches of land and water. The Marconi company has not been so successful in arranging or syntonizing its apparatus so that its signals cannot be intercepted at other stations, although progress has been made. Signals sent from the *Carlo Alberto* were intercepted by Mr. Nevil Maskelyne at Portcurnow.

As a result of these and other experiments, it has been shown that the distance to which the signals can be sent is a question of power and depends upon the generating apparatus. On the *Carlo Alberto*, for example, it was found that the generating apparatus on the ship was not sufficiently strong to produce waves that would affect the receiving instrument on shore, although the shore signals were received plainly on the ship. To supplant the induction coil that is used to produce the waves at the transmitting station, experiments have been carried on with alternating-current generators employing a step-up transformer. Another feature of interest was the discovery that the signals carry further at night than in the day time, and it has been suggested that the sunlight might act to discharge the aerial wire. The coherer in one form or other is the usual receiving instrument in the different systems of wireless telegraphy, but Marconi brought out in 1902 a new magnetic detector, which he described before the Royal Society in London, in June. This detector, which was used during the cruise of the *Carlo Alberto*, consists of two coils of fine copper wire wound around a core of thin wires. The terminals of one coil are connected to a telephone, while those of the other coil lead to the aerial wire at the earth or to the secondary coil of a transformer whose primary is so connected. A permanent magnet revolved by clock work or other mechanism slowly changes the magnetism of the iron core, which, however, lags behind the magnetizing force. If oscillatory currents pass through the coil during the action of the waves, there is a decrease in hysteresis, which seems apparently due to some molecular change. The telephone instead of the relay seems to grow in favor for use with receiving apparatus, as the energy required to produce audible signals is much less than in the case of the relay, which has been generally employed. The coherer is ordinarily employed, and for long distance work a form is used that does not require tapping to restore it to its normal condition. With this instrument the telephone is usually connected in parallel as already indicated. Experiments have also been carried on with various forms of microphones, and also electrolytic coherers, where electrolysis is produced by the oscillations received at the coherer, and as a result the resistance of the circuit varies.

The different navies of the world are now engaged in important wireless telegraphic experiments and in nearly every case the systems adopted have undergone important modifications from the officers or experts in whose hands their direction has been placed. Here, of course, syntonony is the all-important problem, as without it a hostile fleet would be able to intercept and use to its own advantage the signals exchanged between the various ships. During the various manœuvres carried on during 1902 wireless telegraphy played an important part, but the various commanders were not altogether unanimous in their opinions as to its advantages.

In conclusion, it may be said that the long distance signalling was the chief work of the year and in the necessary syntonation some slight progress was made, but far less than is desired and hoped for by the friends of the system. Wireless telegraphy is now in the hands of many electrical engineers, and it seems safe to assume that gradual improvements contributed by many of these men will lead to important

advances. When it is remembered that few years have elapsed since wireless telegraphy has been possible, it seems safe to look for important developments in the wireless system and its commercial operation within a brief period.

WISCONSIN, a northern lake State of the United States, has an area of 56,040 square miles. The capital is Madison. The population in 1900 was 2,069,042, and in June, 1902, as estimated by the government actuary, 2,148,000. The populations of the five largest cities in 1900 were: Milwaukee, 285,315; Superior, 31,091; Racine, 29,102; La Crosse, 28,895; Oshkosh, 28,284.

Finance.—The balance on hand in the treasury of the State of Wisconsin on September 30, 1902, was \$496,408.74. The receipts from October 1, 1900, to June 30, 1902, were \$5,101,232.14. The principal sources of revenue for the year beginning October 1, 1900, and ending September 30, 1901, were: Railroad companies' license fees, \$1,600,379.79; annual tax, \$496,794.20; life insurance companies' license fees, \$263,725; fire insurance companies' license fees, \$108,320.89; charitable and penal institutions, \$85,824.40; sundry sources, fees, etc., \$213,587.99. For the nine months extending from October 1, 1901, to June 30, 1902, the receipts from these sources were, respectively, \$857,854.55; \$568,160.52; \$290,304.41; \$115,474.64; \$77,926.40; \$156,064.42. The disbursements for the period extending from October 1, 1900, to June 30, 1902, were \$5,153,716.88, leaving a balance on hand, July 1, 1902, of \$443,924. The principal objects of expenditure for the year ending September 30, 1901, were: Charitable and penal institutions, \$781,546.51; care of chronic insane in counties, \$441,886.36; circuit court, \$82,081.33; adjutant-general's department, \$100,457.67; legislature, \$149,750.27. For the period extending from October 1, 1901, to June 30, 1902, the disbursements for these objects were, respectively: \$673,677.81; \$404,427.40; \$63,231.64; \$46,775.86, and \$19,079.38. By act of the legislature, the fiscal year was changed so as to end June 30, instead of September 30, as heretofore, which necessitated a report for a period of nine months instead of twelve months.

Agriculture and Industries.—The principal field crops of Wisconsin for 1902, as given by the *Crop Reporter*, were: Corn, 1,504,445 acres, 42,425,349 bushels, \$21,212,674; winter wheat, 120,058 acres, 2,197,061 bushels, \$1,406,119; spring wheat, 412,046 acres, 7,458,033 bushels, \$4,773,141; oats, 2,318,900 acres, 95,037,810 bushels, \$28,511,343; barley, 488,421 acres, 16,508,630 bushels, \$7,393,970; rye, 328,552 acres, 6,209,633 bushels, \$3,104,816; buckwheat, 27,603 acres, 441,648 bushels, \$260,572; potatoes, 250,022 acres, 28,752,530 bushels, \$9,488,335; hay, 1,920,318 acres, 3,268,604 tons, \$25,854,650; tobacco, 48,422 acres, 64,885,480 pounds, \$4,541,984; flaxseed, 41,000 acres, 496,100 bushels, \$595,320. The farm animals in Wisconsin, January 1, 1903, comprised 519,738 horses, value \$40,981,046; 4749 mules, \$321,000; 1,032,955 milch cows, \$32,031,935; 1,148,698 other cattle, \$17,845,142; 1,473,197 sheep, \$4,476,457; and 1,686,885 swine, \$15,148,227. The abandoned timber claims in the northern part of the State are being rapidly utilized for grazing purposes. This region had been practically worthless and deserted after the timber had been exhausted, but the construction of a number of railroads made it accessible and gave it considerable value.

Conventions and Platforms.—The Republican State convention was held at Madison on July 16. Extended reference was made in the platform to the services of Senator Spooner, and regret was expressed that he had determined not to serve another term. It was stated, furthermore, that if he should alter his decision, the party would support him and advocate his re-election. The last Republican State and national platforms were reaffirmed. The administration of Governor La Follette was indorsed. A plank was included protesting against the interference of federal officials in Wisconsin politics. A demand was made for the uniform taxation of taxable property and also for direct nominations for State, legislative, congressional and county offices.

The Democratic State convention was held in Milwaukee, on September 3. The platform protested against trusts and a pledge was made to proceed against them in cases where the law had been violated.

Political.—During the year the long-standing contest between the Wisconsin Republican machine and that portion of the party led by Gov. Robert M. La Follette (*q.v.*) attracted national attention by reason of its involving the return to the United States Senate of Senator John C. Spooner (*q.v.*). The organization Republicans, with whom Senator Spooner has long been identified, tried to make it appear that the La Follette party was seeking to prevent the senator's re-election which, whatever may have been Gov. La Follette's personal desire, was not the wish of a great majority of his followers. The State convention which renominated La Follette, however, in endorsing the candidacy of Spooner, inserted a clause which practically demanded of him a pledge to support the primary election and railway taxation reform programme of the governor. To this Senator Spooner, without intimating that he disapproved the reforms, replied that the convention had no right to bind him, as the matters were wholly questions of State policy, and had nothing

whatever to do with the national policies upon which he and the party were in complete agreement. The organization by forcing a fight in the convention on the inclusion of this conditional clause in the indorsement of the senator made it seem for the time being that there would be a serious split in the party as a result, as La Follette's followers were apparently just as insistent upon the condition being imposed. Senator Spooner however, in October, announced his decision to become a candidate for re-election without saying a word about the condition. The large number of La Follette's followers who were also advocates of Senator Spooner's re-election, with or without a pledge as to his support of La Follette's reform measures, prevented a fight from being made over the matter, and after the Republican victory at the polls in November there was never any doubt as to Spooner's return. Governor La Follette, who was re-elected, was considerably behind his ticket, a fact said to be due to cutting by the organization Republicans, but the legislature was overwhelmingly Republican, and there was no sign of a movement in opposition to Spooner's re-election. In December announcement was made that his re-election in January, 1903, was assured by a canvass of legislators.

At the November State election, for the first time in the history of Wisconsin, women voted, the last legislature having passed a law allowing them to vote on school questions and for candidates for school offices. They voted November 4 for State superintendent of public schools, county superintendent of schools, and on an amendment changing the term of office of the school superintendent.

Elections.—At the regular biennial State election, held November 4, 1902, a full Republican State ticket was elected. The vote for governor was La Follette (Rep.), 193,417; Rose (Dem.), 145,818, giving La Follette a plurality of 47,599. The State legislature for 1903 will consist of 30 Republicans and 3 Democrats in the Senate, and 75 Republicans and 24 Democrats in the House.

State Officers.—For 1902: Governor, Robert M. La Follette; lieutenant-governor, Jesse Stone; secretary of state and auditor, W. H. Froehlich; treasurer, J. O. Davidson; attorney-general, E. R. Hicks; superintendent of education, L. D. Harvey; commissioner of insurance, Emil Giljohnn; commissioner of railroads, G. L. Rice—all Republicans. For 1903: Governor, Robert M. La Follette, elected for two years, term ending January, 1905; lieutenant-governor, J. O. Davidson; secretary of state and auditor, W. L. Houser; treasurer, J. J. Kempf; attorney-general, L. M. Sturdevant; superintendent of education, C. P. Cary; commissioner of insurance, Zeno M. Host; commissioner of railroads, John W. Thomas—all Republicans.

Supreme Court in 1902 and 1903: Chief justice, John B. Cassoday; associate justices, John B. Winslow, R. D. Marshall, C. V. Bardeen, and J. E. Dodge—all Republicans except Winslow and Dodge, Democrats.

For congressional representatives, see UNITED STATES (paragraph Congressional Representatives).

WISCONSIN, UNIVERSITY OF, Madison, Wis., had in 1902 an attendance of 2810, an increase of 158 over 1901, and 187 instructors. The gross income amounted to \$575,000. The new Agricultural Hall, for which the State gave \$150,000, was nearly completed and equipped at an additional cost of \$25,000. A bill was brought before the legislature asking for increased appropriations, and for a new chemical building, and new courses were added in various departments.

WODEHOUSE, JOHN, first Earl of Kimberley. See **KIMBERLEY, FIRST EARL OF**.

WOLFF, HERMANN, a German concert impresario, died in Berlin, Germany, February 4, 1902. He was born in Cologne, September 4, 1846; and studied music under Kroll and Wuerst. After distinguished service in the Franco-German War, for which he received the Iron Cross, he followed for a while his father's business of stock-broker. His distaste for business life, however, led him to attach himself to a music publishing house; and a meeting with Rubinstein, followed by a tour with him through Spain, resulted in his adopting the occupation of managing musical events. He displayed great energy and ability in his chosen field, and few important concerts were given in Germany after 1880 which were not under his direction. While connected with the business affairs of von Bülow he founded the Berlin Philharmonic Orchestra, which is now the best-known orchestra in Europe; and the success of many other musical enterprises was due to the force of his personality. He edited the *Neue Berliner Musikzeitung* from 1878 to 1879, and was an associate editor of the *Musikwelt*.

WOMAN'S CHRISTIAN TEMPERANCE UNION, NATIONAL, organized November, 1874, at Cleveland, Ohio, has about 10,000 local unions, with a membership, including children's societies, of over 600,000. Forty-four distinct departments of work, presided over by as many women experts, are conducted by the organization, which claims that through its influence nearly every State in the Union has on its statute books laws requiring the study of scientific temperance in the public schools; prohibiting the sale of tobacco to minors; raising the age of

consent; providing for the better protection of women and girls; the appointment of police matrons; the establishment of industrial homes for girls and of houses of refuge for erring women; and various other legislative work of an important and elevating character. At the twenty-ninth annual convention of the organization, held at Portland, Me., October 17-22, 1902, the treasurer's report for the year, as presented, shows a revenue of \$28,824.99, which, with a balance of \$536.51 from the previous year, made a total of \$29,361.50. The expenditure was \$29,315.23, leaving a balance of \$46.27 in the treasury. Among the resolutions passed at the convention was one thanking the Fifty-seventh Congress for the passage of a bill appropriating \$500,000, "for the construction and maintenance of suitable buildings at military posts and stations already established and occupied, for the conduct of the exchange-store, school, library, reading, lunch and amusement rooms, gymnasium, etc." The place for holding the convention in 1903 was left to the judgment of the executive committee. President, Mrs. L. M. N. Stevens; corresponding secretary, Mrs. S. M. D. Fry, Rest Cottage, Evanston, Ill.

WOMAN'S COLLEGE OF BALTIMORE, incorporated 1885 and opened 1888. The student body in 1902 numbered 355, all of college grade, and the faculty 30. The college has an endowment of \$432,000, and grounds and buildings worth \$693,000. In 1902 the library contained 9300 bound volumes. The income was \$65,583. The year was marked by an increase in the endowment of the college, and the construction of an additional college building. Changes in courses of instruction were decided on to take effect in 1903.

WOOL. The woolen industry was in a prosperous condition during 1902. The growers, merchants, and manufacturers together participated in the benefits of an active business, and both raw material and manufactured products have been in active demand. The number of sheep in the United States at the spring shearing reached 42,950,056, the largest number since 1894, though the increase in 1902 was not as great as in previous years. The clip was greater than in 1901 by 3,793,500 pounds, and the only State showing a marked falling-off was Texas. In the north-west, especially in Montana and Wyoming, large gains were to be noted in the clip. In Australia, where considerable amounts of wool are produced, conditions were not as favorable as in the United States, there being a heavy mortality among the sheep, on account of the drought. This shortness in the supply, together with an active demand for wool in continental markets, tended to keep prices up, so that the producers in nearly all cases secured satisfactory returns for their fleeces and a distinct advance of prices through the year occurred, the quotations at the end of the year for the best grades being about four cents a pound higher on an average than at the beginning. The conditions existing in the trade perhaps are best shown by the statement that the supply of wool on hand in the United States at the close of 1902, exclusive of that held by manufacturers and in bond was 138,259,000 pounds, as compared with 177,191,000 pounds in 1901. The wool in bond amounted to 29,695,926 pounds at the close of 1902, as compared with 35,012,036 pounds a year before. This makes the total supply 167,954,926 pounds at the end of 1902, as compared with 212,203,036 in 1901, or a decrease of about 26 per cent. Another measure of the year's activity is the fact that the imports of wool for the fiscal year (ending June 30) 1901-02, amounted to 166,262,148 pounds, as compared with 103,583,505 pounds, being the largest since 1896-97 previous to the passage of the Dingley Bill, when they amounted to 350,852,026. The imports for the calendar year were 176,292,639 pounds, valued at \$19,590,227, as compared with 124,964,377 pounds, valued at \$14,017,432 in 1901. The various manufactured articles including cloth, clothing, etc., imported in 1902 were valued at \$18,771,774, as against \$15,604,780 in 1901. See table on the following page.

WRESTLING. The championships of the Amateur Athletic Union, under whose auspices the principal amateur wrestling contests of the United States are held, were won as follows in 1902: 105 pounds, William Karl; 115 pounds, George Hembert; 125 pounds, J. Nefflock; 135 pounds, F. Cook; 145 pounds, N. Nelson; 158 pounds, J. Schuman.

WYOMING, a northwestern State of the United States, has an area of 97,890 square miles. The capital is Cheyenne. Wyoming was organized as a Territory in 1868, and admitted to the Union July 10, 1890. The population in 1900 was 92,531, and in June, 1902, as estimated by the government actuary, 99,000. The populations of the largest cities in 1900 were: Cheyenne, 14,687; and Laramie, 8207.

Finance.—The balance in the treasury of the State of Wyoming at the beginning of the fiscal year ending September 30, 1902, was \$168,916.37. The total receipts during the year were \$478,758.12, and the expenditures \$204,636.53, leaving a balance on September 30, 1902, of \$253,037.96. The main items of revenue and the amounts derived therefrom were: The State tax, \$258,104.11; land leases and sales, \$90,561.05; fees and earnings of officers and State institutions, \$68,677.46. The State

WOOL PRODUCTION IN THE UNITED STATES, 1902 AND 1901.

* Figures of board of equalization.

† Average.

debt on September 30, 1902, amounted to \$300,000, showing a reduction of \$20,000 during the fiscal year. A further reduction of \$20,000 was made on December 31, 1902, leaving a total of \$280,000.

Agriculture and Industries.—The principal field crops of Wyoming for 1902, as given by the *Crop Reporter*, were: Spring wheat, 23,130 acres, 543,555 bushels, \$440,-280; oats, 36,179 acres, 1,302,444 bushels, \$651,222; potatoes, 3,702 acres, 396,114 bushels, \$241,630; hay, 160,324 acres, 264,535 tons, \$1,925,815. The most interesting development in agriculture was the extension of irrigation. An area of 210,359 acres had been segregated, to which irrigation canals were being built. The State charges settlers \$0.50 per acre for this land. The proceeds are turned into the irrigation fund. The fund on hand January 1, 1903, was \$1,047.49. The area of school and selected lands under lease by the State, September 30, 1902, was 2,302,501 acres, as against 1,860,225 acres two years previous. The average valuation of leased land was \$0.81 per acre in 1900, \$0.83 in 1902. Stock-raising is of far more importance than agriculture in Wyoming. On January 1, 1903, there were in the State 113,444 horses, valued at \$3,282,736; 1481 mules, \$78,292; 19,587 milch cows, \$753,316; 796,060 other cattle, \$18,553,928; 5,826,150 sheep, \$14,300,695; and 15,983 swine, \$168,780. No

State except Montana exceeded Wyoming in the number and value of sheep. The number increased more than 600,000 in 1902. The 1902 wool-clip was 32,869,835 pounds, and had an approximate value of \$4,100,000. The hostility existing between sheep men and cattle rangers, due to the contest for pasturage on public lands, resulted in 1902 in numerous severe conflicts. A number of men and thousands of animals were killed or injured. There was a considerable decrease in the output of copper. The North American Copper Company acquired several large properties at Grand Encampment, and commenced the construction of a concentration plant. The mine inspector reported that approximately 15,000 men were engaged in mining and transporting coal. He estimated the 1902 output at 5,000,000 tons. The output in 1901 was 4,485,374 tons and had a value of \$6,060,462. At various times during the year there was great excitement for small cause in the oil fields. A great deal of prospecting was done, but there was no marked increase in production.

Conventions and Platforms.—The Republican State convention was held at Rawlins on July 16. In the platform the President and administration were strongly indorsed. Special mention was made of the assistance given by the President to the western States. Trusts and combinations were condemned, in instances where they worked to create monopolies, to limit production, or to control prices. At the same time it was stated that the party in Wyoming recognized the necessity and propriety of the honest cooperation of capital to meet new business conditions. A special plank declared in favor of an early completion of the allotments of land in severalty to the Indians of the Shoshone reservation and the purchase from the Indians by the government and the opening to homestead settlement of the portion of the reserve unoccupied and unnecessary for the support of the Indians. The plea in behalf of this action was that it would tend to the development of the agricultural resources of the State.

The platform of the Democratic State convention declared in favor of the election of United States senators by direct vote; municipal ownership of public utilities; the original form of Australian ballot, and the compulsory arbitration of labor disputes. Trusts were condemned, and the amendment of the interstate trust laws was called for. Reference to State legislation was made as follows: "We propose that the State of Wyoming awake from its dormant condition and put itself in line by means of similar domestic legislation with the other progressive States of the Union."

The Socialist platform advocated the education of all children up to the age of eighteen years, with State and municipal aid for food, books and clothing; the initiative and referendum; public ownership of utilities; equal civil and political rights for men and women; the right to recall representatives of the people when their conduct merited disapproval, and State or national insurance of working people in case of accidents, lack of employment, sickness and want in old age.

Elections.—At the regular biennial State election, held November 4, 1902, a full Republican State ticket was elected. The vote for governor was Richards (Rep.), 14,483; Beck (Dem.), 10,017, giving the Republican candidate a plurality of 4466. The State legislature for 1903 will consist of 20 Republicans and 3 Democrats in the Senate, and 46 Republicans and 4 Democrats in the House.

State Officers.—For 1902: Governor, De Forest Richards; secretary of state and lieutenant-governor, F. Chatterton; treasurer, G. E. Abbott; auditor, Leroy Grant; attorney-general, J. A. Van Orsdel; superintendent of education, T. T. Tynan—all Republicans. For 1903: Governor, De Forest Richards (elected for four years, term ending January, 1907); secretary of state and lieutenant-governor, F. Chatterton (term ends January, 1907); treasurer, Henry G. Hay, appointed (term ends February 21, 1903); auditor, Leroy Grant (term ends January, 1907); attorney-general, J. A. Van Orsdel, appointed (term ends February 21, 1903); superintendent of education, T. T. Tynan, term ends January, 1907—all Republicans.

Supreme Court for 1903: Chief justice, S. T. Corn; associate justices, C. N. Potter and Jesse Knight—all Republicans, except Corn, Democrat.

For congressional representatives, see UNITED STATES (paragraph Congressional Representatives).

X-RAYS. See RÖNTGEN RAYS IN MEDICINE.

YACHTING. In 1902 the absence of races in competition for the *America's* cup brought the yachting season less prominently before public attention than in 1901, although to enthusiasts the season was filled with interesting events. Chief of these was the series of races sailed on Lake St. Louis, Montreal, between the Royal St. Lawrence Yacht Club of Montreal, holder of the Seawanhaka international challenge cup for small boats, and the Bridgeport (Conn.) Yacht Club, which sought to bring back the trophy to the United States. The defender was the *Trident* and the challenger the *Tecumseh*. Four races were sailed, over a 12-mile course, and resulted as follows: (1) Windward and return, *Trident* won by 14 minutes 52

seconds; (2) triangular course, *Tecumseh* won, by 1 minute 22 seconds; (3) windward and return, *Trident* won, by 4 minutes 11 seconds; (4) triangular, won by the *Trident* by 5 minutes 27 seconds. Abroad, at the Kiel regatta, given by the German emperor, there were two English yachts, ten German (one of which, the *Samoa III.*, was sailed by the Emperor himself), two French, one from Sweden, and one, the *Uncle Sam*, from the United States, in the race for small boats. The *Uncle Sam*, a 21-footer, won the trophy in two races, winning the first by 22 minutes 26 seconds, and the second by 24 seconds. In October, 1902, the New York Yacht Club accepted a challenge from the Royal Ulster Yacht Club for a series of races for the *America's* cup, to be sailed in August, 1903. The yacht, a 90-footer, was to be owned by Sir Thomas Lipton and would be called *Shamrock III.*

YALE UNIVERSITY, New Haven, Conn., founded 1701. The year 1902 evidenced the influence of the bicentennial celebration (1901) in increased numbers, activity, and enthusiasm. Of the bicentennial group of buildings, Woolsey Hall or the Auditorium, the Memorial Hall, and Ryers Hall in connection with the Sheffield Scientific School, were completed during the year. The most important gift of the year was the Southworth legacy of \$160,000. Yale Field was transferred to the University Corporation. The increased attendance is most marked in the Medical and Law schools and in the School of Forestry, though there is a marked increase of graduate students as well. Additional instructors were appointed in the School of Forestry and a journal of forestry established. The university announced its adherence to the old plan of admitting students to all professional schools without the baccalaureate degree, as a preliminary requirement; and also the continuation of the traditional requirement of Greek for admission. On the other hand, students entering from other colleges without Greek are permitted to graduate. There is a distinct opposition to any shortening of the collegiate course.

The teaching staff of the university now numbers 311. The total registration of students was 2816, as compared with 2685 of the previous year. This registration is divided as follows: Graduate school, 346; college, 1205; Sheffield Scientific School, 738; fine arts, 29; music, 47; forestry, 40; divinity school, 112; law school, 253; medical school, 145. The registration in the fall of 1902 was 2804.

YOUNG MEN'S CHRISTIAN ASSOCIATION. The work of the year 1902 shows a marked improvement over the preceding year. The number of associations in North America has reached 1575, showing an increase of 99 within the year. There are 6335 associations in the world. The total membership of the American branches is 323,224, having 414 buildings which they own and which have a value of \$22,803,030. The number of libraries owned at the end of the year has reached 736, containing 544,275 volumes. The total expenditure for the year for local, State and international (North America) association branches amounted to \$3,535,783. In connection with the army work of the association a bill was passed by Congress and signed by the President authorizing the secretary of war to permit the erection of association buildings on military reservations. A new building was erected during the year for navy work in Brooklyn, where also a building for the use of colored associations was presented by George Foster Peabody, valued at \$8000. The number of railroad associations is now 175, a gain of eighteen during the year; the membership has increased from 42,000 to over 50,000. Twenty buildings have been erected during the year, making a total of 92 buildings now owned or set apart for railroad associations, representing a value of over \$1,500,000. The executive work of the association is divided so as to cover American and foreign fields. The Central International Committee, with headquarters at No. 3 General Defour, Geneva, Switzerland, has control of all the branches in Europe, Asia, Africa, and Australia, and is composed of members representing the various nationalities. Chairman, Edouard Barde; secretary, Louis Perrot. The international committee is the general executive of the associations of North America. Chairman, Lucien C. Warner; general secretary, Richard C. Morse, 3 West Twenty-ninth Street, New York City.

YOUNG PEOPLE'S CHRISTIAN UNION, a society of the United Brethren in Christ, founded in 1890, the work of which is similar to that of the United Society of Christian Endeavor. It now has 1689 societies and 63,846 members, not including an approximate membership of 16,000 in the junior organizations. The general convention, whose sessions are biennial, met in July, 1902, in Canton, O.; its next meeting will be held in Grand Rapids, Mich. The official organ of the union, *The Watchword*, published weekly under the editorship of Rev. H. F. Shupe, has a circulation of 27,000. President, Rev. John G. Huber, A.M.; corresponding secretary, Rev. Charles W. Brewbaker, A.M., S.T.D., Canton, O.

YUKON TERRITORY, formerly one of the districts comprising the Northwest Territories of the Dominion of Canada, but since 1898 a separate territory, lies directly east of the United States Territory of Alaska. It has an estimated area of 198,300 square miles, and a population estimated in 1902 at about 27,219, of

whom 70 per cent. are Americans. Dawson City, the seat of government, has a population of about 10,000. The majority of the inhabitants of the territory are miners, living in the Klondike gold-fields, and the name Klondike, although properly the designation of but a small part of the territory, has come to be commonly applied to the whole. The administration is in charge of a commissioner, acting under the Dominion minister of the interior. He is assisted by a territorial council composed of the principal appointive Dominion officials in the territory and two members elected by the qualified voters. In 1901 the revenues amounted to \$1,993,983, including \$592,661 from gold royalties; \$225,595 from mining fees and leases; \$125,861 from free miners' certificates; \$108,272 from telegraphs, and \$630,959 from customs. The expenditures in that year amounted to \$1,671,085, of which \$498,825 was expended on mounted police; \$386,064 on public works; and \$319,761 on salaries, surveys, and administrative expenses. The appropriations by the Dominion government in 1902 amounted to \$1,092,800, which sum it was estimated would be more than met by the territorial revenues. Unofficial estimates of the value of the Yukon trade placed the imports at \$2,823,633 in 1901, and \$2,019,782 in 1902, and the exports at \$13,083,676 in 1901 and \$14,083,487 in 1902. The value of the gold production in 1902 was estimated at \$24,000,000, as compared with \$18,000,000 in 1901. For 1903 a very considerable reduction was looked for, as the old creeks and finds have been about worked out, and there have been no new discoveries for over a year. A continuation of the present prosperity seems to be altogether dependent on the discovery of gold-bearing quartz containing enough pay-ore to make it worth while to mine. Early in 1902 the Yukon council laid a petition before the Dominion government making numerous requests in the line of representation in the Dominion parliament, an increase in the representative character of the council, and a greater amount of autonomy in local affairs.

ZANGEMEISTER, KARL, a German archaeologist, died in June, 1902, at Heidelberg. He was born November 28, 1837, in Hallungen, Gotha; studied at Bonn and Berlin, devoted a year and a half in Italy to the study of epigraphy, and returned to Berlin in 1865, where he was employed in connection with the *Corpus Inscriptionum Latinarum*. In 1868 he was appointed to a position in the Gotha library, and in 1873 became director of the Heidelberg University library, which, under his care, became known as one of the best managed in Germany. He was a pupil and intimate friend of Mommsen, and was conceded to be the foremost living authority in his special branches of palæography. After 1892 he acted as president of the Limes-Kommission, and was also a member of the Berlin Academy of Sciences. Among his most important writings may be mentioned: "Inscriptiones Parietariæ Pompeianæ, Herculaniensis, Stabianæ," for the *Corpus Inscriptionum Latinarum* (1871), and "Glandes Plumbæ Latine Inscriptionæ," for *Ephemeris Epigraphica* (1885).

ZANZIBAR, a British protectorate, consisting of the island of Zanzibar (area 640 square miles, population 150,000), the island of Pemba (area 380 square miles, population 50,000), and several smaller islands along the shore of German East Africa. Government is administered by a native sultan (seyyid) under the supervision of a British agent and consul-general. The mainland territories of the sultan are leased to Great Britain. In 1900 imports and exports were valued at £1,116,041 and £1,167,041 respectively; in 1901, £1,196,831 and £1,168,518 respectively. The most important export produced in the islands is cloves. Seyyid Hamoud bin Mahomed bin Saïd, who succeeded to the sultanate on the death of Hamed bin Thwain in August, 1896, died July 18, 1902. He was succeeded on the twentieth by his son, Seyyid Ali. Until the new sultan, who was born in 1884, shall attain the age of twenty-one, the government will be administered in the name of Mr. Alexander Stuart Rogers, prime minister, as regent. Seyyid Ali bin Hamoud has received some educational training in England. A treaty between Great Britain and the United States concerning import duties in Zanzibar was signed on May 31, 1902, and the ratifications were exchanged on the seventeenth of the following October. The treaty provides that for a period of 15 years the tariffs shall not exceed 10 per cent. of the value of the merchandise at the spot of importation, except in the case of spirits, fire arms, and ammunition.

ZANZIBAR, SULTAN OF. See HAMOUD BIN MAHOMED BIN SAÏD.

ZIEMSEN, HUGO WILHELM VON, a German physician, died January 21, 1902, at Berlin. He was born December 13, 1829, in Greifswald, and studied medicine at Berlin and Würzburg. In 1863 he became professor of pathology and therapeutics at Erlangen, and director of the city hospital of Munich in 1874. His most valuable work was in connection with the application of electricity in medicine, in the treatment of typhus, pneumonia, and diseases of the œsophagus and larynx. He was the author of the *Handbuch der speciellen Pathologie und Therapie*, a standard work in German medical literature (17 vols., 1875-84; 3d ed. 1886); *Die Kaltwasser-*

behandlung des Typhus (with Zimmermann, 1870); *Die Elektrizität in der Medizin* (5th ed. 1887); *Ueber die Behandlung des Magengeschwürs* (1871); *Annalen der städtischen Krankenhäuser in München*, which he compiled while director (1878-94).

ZINC. The rapid expansion which has characterized the zinc mining industry in the United States during recent years was well maintained in 1901 and 1902. According to the final returns published by the United States Geological Survey, the output in 1901 was 140,822 short tons, valued at \$11,265,760. The output in 1902 is estimated by *The Engineering and Mining Journal* at 158,447 short tons, with a value of \$14,380,650. This is more than twice the total reported for 1894, and nearly four times that of 1885. The domestic consumption of zinc has nearly kept pace with the production, so that the exports have amounted to only a few thousand tons annually. Among the important developments during 1902 were the erection of several new smelters in the natural gas region of Kansas, where the metallurgical industry is largely centred, and the consolidation of some of the smaller producers with the larger concerns.

ZIONISM. See **JEWS.**

ZOLA, EMILE EDOUARD CHARLES ANTOINE, French novelist, died September 29, 1902, at Paris, where he was born April 2, 1840. His father, half-Italian and half-Greek, was an officer in the French army, and a civil engineer of some note. He died during Emile's childhood, leaving his Norman widow penniless. Emile was educated at a lycée in Paris and was a voluminous reader. He found employment with the publishing firm of Hachette, and began contributing stories and articles to journals, all the time suffering severest poverty. Some of these stories appeared as the *Contes à Ninon* in 1864. *Thérèse Raquin* came out in 1867, and, by his admirers, is classed among his masterpieces, as is also his *L'Attaque du moulin* (1880) for its nervous, compelling qualities. His book of critical papers called *Mes Haines* (1866) is still of interest. In testimony of his courageous foresight at that period (1867) may be cited his appreciation of impressionism in his book on Manet.

The second period of activity of the future chief of the "naturalistic" school began with his great series of twenty novels under the general title of *Les Rougon-Macquart: une histoire naturelle et sociale d'une famille sous le second empire* (1871-93). These "human documents" are: *La Fortune des Rougon*; *La Curée*; *Le Ventre de Paris*; *La Conquête de Plassans*; *La Faute de l'abbé Mouret*; *Son Excellence Eugène Rougon*; *L'Assommoir*; *Une Page d'Amour*; *Nana*; *Pot-Bouille*; *Au Bonheur des Dames*; *La Joie de Vivre*; *Germinal*; *L'Œuvre*; *La Terre*; *Le Rêve*; *La Bête Humaine*; *L'Argent*; *La Débâcle*; and *Le Docteur Pascal*. This colossal work, which may be called the *Tragédie Humaine*, as a counterpart to Balzac's *Comédie Humaine*, was widely read at home and abroad, violently arousing the literary world. It was naturalistic in that it undertook to photograph a whole cross-section of French society in detail with an unpitiful exactness unfamiliar to polite literature. It was a study of the hereditary and sociological, the political and industrial, influences of the epoch on the race. It distinctly, brutally, forced on the attention of men the sores of civilization. These repulsive, but masterfully graphic pictures of the ravages of strong drink, prostitution, the homicidal mania, and the passion for money, for political power, and for scientific fame, seemed for a time to threaten the foundations of conventional art. To the conservers of tradition, Zola seemed to depict life, only in part, through the oblique, leering vision of the animal in man. They could not forgive him for his hard, harsh, "sordid epic" so "fundamentally at enmity with joy"; and for his attempt to transform art into a scientific or statistical process. To the young radicals of the day, however, Zola was the true and mighty product and force of a scientific and utilitarian age. He was an apostle performing an unpleasant, unavoidable duty in order that the world might hasten its upward progress, and literature become a more open, sincere, and potent factor in the uplift of humanity. They did not overlook the sweet, pure idealities of *Le Rêve*. They pointed to *L'Assommoir* as the most telling temperance tract in letters. There was *Nana*, too—that everlasting damnation of harlotry; for never in the history of fiction had this vice been painted with such epic hideousness and unqualified disgust. There was *La Débâcle*, now generally considered Zola's finest masterpiece and as perhaps unexcelled in contemporary fiction: an elaborate and vivid picture of degenerate and agonized France biting the dust under the heel of Prussia. And then, finally, there was the unquestioned art of Zola's pen. His narrative proceeds from the simple and direct to the immense and overwhelmingly inevitable, avoiding the theatrical and melodramatic, and all set forth with a compelling power that was emphasized by its concentration as well as by its accumulating recurrence and by an unsurpassed employment of living phrase.

In his third and last literary period Zola, who had become not only celebrated

but prosperous, and the advocate of science as the practical guide and hope of the race, and of labor as the true daily religion, turned toward idealism. His next series of novels was *Les Trois Villes: Lourdes* (1894); *Rome* (1896); and *Paris* (1898). And his last series was *Les Quatres Evangiles: Fécondité* (1899); *Travail* (1900); *Vérité* (1902); and *Justice*, left unfinished. All these novels, vast in design, each with forty or more personæ and multiple perspectives of the panoramas of human endeavor, are, however, not vital, vibrant stories. They are more or less factitious expositions of a moralizing fact-accumulator and philosopher dealing with wooden characters anent, for instance, the blessings of fruitfulness, the hierarchy of the church, etc. In the domain of fiction these volumes have been taken as testimony of the passing of the naturalistic school, and of the "bankruptcy of science" as a universal panacea, although Zola said he never held that science would make the world happy.

It remained for him, as a man, to silence the tongues of personal detractors by the rôle he played in the Dreyfus case. In 1898 he came forth to denounce, in his famous *J'accuse* letter, the procedure by which the French nation had involved itself in connection with this insignificant and despised Jew. Zola lost nearly all his friends, saw his fortune swept away, and was driven from his home and his country, barely escaping with his life at the hands of the Parisian mobs. Abroad, however, the "gutter" novelist, this "groveler" in the "troughs" of literature, was now recognized as faithful to the ideals of a lofty conscience alive to truth and justice. And many of his old literary enemies began to understand how after all it might be possible that years before, in creating the Rougon-Macquart series, he had deliberately sacrificed his artistic talents to a utilitarian end, that he had been an offender against taste, not morals, and that he had desired the sad satisfaction of being a reformer rather than the pleasing vanity of being an author.

Zola was accidentally asphyxiated at night, in his chamber, by coal gas escaping from a chimney. He left a widow with no children. His funeral rivaled that of Hugo in public interest, 60,000 persons following the remains to the grave. Zola was a bourgeois in type; of medium height and stout; with a tired, sad face. He was a ready talker, but had a poor, high voice. His friends esteemed him as a simple, quiet, good man who, under a somewhat blunt and stern exterior, was always ready to lend a helping hand. His life was unflinchingly devoted to the rights and wrongs of the oppressed classes and of the miserably erring. A stormy, virile spirit, actively concerned with many widely different subjects, and troubled with a polemical career, he was nevertheless the most steady and indefatigable of writers.

ZOOLOGICAL EXPEDITIONS AND STATIONS. During 1902 the number of expeditions and stations was very considerable and the following summary refers only to the more important.

Expeditions.—The United States Fish Commission steamer *Albatross* sailed from San Francisco, March 11, for a marine biological survey of the Hawaiian Islands. The work was in charge of Dr. Charles H. Gilbert and his associate, Prof. C. C. Nutting. The vessel remained at work until August, when she returned to San Francisco. Extensive and important collections were made in all the great groups of marine animals. President D. S. Jordan sailed for Samoa, June 12, where in company with Prof. V. L. Kellogg, he spent the summer collecting fishes and investigating the fish fauna of the Samoan Islands. Prof. Alexander Agassiz returned in the spring from a survey of the Maldives Islands, where he had spent some time in the study of coral reefs. Prof. C. H. Eigenmann spent a part of the early spring in western Cuba, exploring caves and investigating their fauna. Many specimens of blind fish were secured and much important information was obtained in regard to their distribution and breeding. Prof. W. A. Herdman spent the greater part of the year in Ceylon investigating the pearl-fisheries, especially in the Gulf of Manaar. His objects were the inspection of the oyster banks, investigations into the marine zoology of Cingalese waters, and the selection of a suitable spot for a marine laboratory. His observations convinced him that "there is no reason for despondency in regard to the future of the pearl-oyster fisheries, if they are treated scientifically." Mr. J. S. Budgett left London for Uganda and the Semliki River late in May, where he planned to collect mammals, birds and fishes, and, if possible, study the habits of the okapi.

Stations.—Turning now to permanent stations, we find that the most famous one, Naples, has outgrown its present equipment and has begun the building of an addition which will double the capacity of the working part of the laboratory. At present America maintains only three tables, which are not nearly enough to provide for the applicants, for during the past eleven years 69 Americans have studied at the station. The well-known laboratory at Bergen, Norway, has enlarged its facilities and made plans for a winter school of biology to be held at the station. The station at Arcachon, France, is now well equipped, but has not as yet drawn many students. A subsidiary station has been opened at Guethary, where the opportunities

EMILE ZOLA

for dredging are said to be excellent. Of American stations, very successful seasons were enjoyed at the Tufts College station, South Harpswell, Maine; the station of the Brooklyn Academy of Arts and Sciences, at Cold Spring Harbor, Long Island; the University of California station at San Pedro; and the University of Minnesota station, on the straits of Juan de Fuca. Most interest has centred, however, around the stations of the fish commission at Woods Hole, Mass., and Beaufort, N. C., and in the relation between the Marine Biological Laboratory at Woods Hole and the Carnegie Institution. At the fish commission stations much work was done in the way of investigating the fauna of the regions about the laboratories. At Woods Hole several very successful dredging trips were made to points forty or fifty miles from the laboratory, and a number of marine invertebrates were added to the known fauna of the Woods Hole region. At Beaufort, even more interesting results were obtained, as the fauna there is not nearly so well known as at the Massachusetts station. The most remarkable discovery was that of a submarine bank about twenty miles off shore which seems to be a veritable coral reef, with a real coral reef fauna. Much discussion has resulted from the action of the Corporation of the Marine Biological Laboratory in voting, in August, to transfer the laboratory and its equipment to the Carnegie Institution, in return for certain financial benefits. Although there were only two votes against the plan, one of the two objectors proved so successful an opponent of the plan that it was finally abandoned in November by the action of the Carnegie Institution itself, which has, however, voted a considerable sum of money to the laboratory and has at its disposal twenty tables for investigators. Although the laboratory enjoyed a fairly successful season, its financial condition was critical.

ZOOLOGICAL LITERATURE. The amount of zoological literature published annually continues very large, and in the space at our disposal we can speak of only those books or papers which are of special interest. A new zoological, or perhaps more properly, biological journal has been launched, called *Archiv für Protistenkunde*, devoted exclusively to the publication of papers upon unicellular animals and plants. The *Archiv* will be published at irregular intervals without set limits as to size, and contributions will be printed in English, French, or German.

Popular Books.—The output of popular books on zoology has been unusually large, and the quality is as a rule very high. One of the most attractive is Beddard's *Mammalia*, vol. x. of the *Cambridge Natural History*, a book of over 600 pages, with numerous, if not always satisfactory, illustrations. It is decidedly the best book on mammals now extant, and of course its scientific accuracy and value are fully guaranteed by the author's standing among zoologists. A very handsome, as well as useful, work is Jordan and Evermann's *American Food and Game Fishes*, a volume of nearly 600 pages, notable for the very numerous illustrations, most of which are full-page plates, many beautifully colored. In the American Sportsman's Library three volumes have appeared which are sure to attract much attention. One of these deals with game birds. (See ORNITHOLOGY.) One of the others is entitled *The Deer Family* and is the work of Theodore Roosevelt, D. G. Elliot, and others. The third volume of the series is on *Salmon and Trout*, by D. Sage and others, and is a somewhat larger volume with over 400 pages. In England a number of popular books have appeared, of which perhaps the most interesting is Alcock's *A Naturalist in Indian Seas*. The volume by C. J. Cornish, entitled *The Naturalist on the Thames*, is a very pleasantly written and well illustrated book of 268 pages. In the so-called *Woburn Library* has appeared a series of books dealing with the fresh-water fishes, marine fishes, birds, butterflies and moths, and mammals of Great Britain, written by various authors, Sir Harry Johnston furnishing the volume on mammals. The same publishers have issued a volume by T. Saville-Kent on *Lizards, Living and Extinct*.

Text-Books.—Some very valuable text-books have been issued during 1902, chiefly, however, in Germany. Professor J. S. Kingsley has published a translation of the fifth German edition of Hertwig's *Manual of Zoology*. From Prof. H. S. Pratt we have a very useful little book, *A Course in Invertebrate Zoology*, containing directions for the dissection of a considerable variety of invertebrates. In England volume ii. has appeared of Bourne's *Introduction to the Study of the Comparative Anatomy of Animals*, a book of over 300 pages. At Jena, after a delay of nine years, there has at last appeared the first two sections of the general part of Korschelt and Heider's *Lehrbuch der vergleichenden Entwicklungsgeschichte der wirbellosen Thiere*, consisting of 548 pages. The concluding volume is promised at an early date. From the same press comes Ziegler's *Lehrbuch der vergleichenden Entwicklungsgeschichte der niederen Wirbelthiere*, a finely illustrated volume of more than 375 pages. The book is the product of twelve years' careful work and really fills a gap in the list of embryological text-books. A third important work from the same press is Schneider's *Lehrbuch der vergleichenden*

Histologie der Thiere, a valuable work of a thousand pages. There is one more book which is worthy of mention as a text-book, and that is Jordan and Heath's *Animal Forms: a Second Book of Zoology*. A very valuable work, of 354 pages, is Chapman's *The Foraminifera, an Introduction to the Study of the Protozoa*. Five valuable papers on the brachiopods have appeared during the year. Of these the largest and perhaps the most important is Morse's *Observations on Living Brachiopoda*, a memoir of 70 pages and 22 admirable plates. Three of the other papers are by Naohidé Yatsu and deal with the Japanese species of *Lingula*, its development, histology, and habits. Of a very different nature, but more practically important, is a little pamphlet of only 16 pages on *The Rabbit Pest in Australia, Its Cause and Its Cure*, by W. Rodier. In the well-known, magnificent series of monographs from the Naples zoological station, a zoological volume has recently appeared, written by Theodor List and entitled *Die Mytiliden des Golfes von Neapel*. Of the great German work, *Das Tierreich*, a number of parts have appeared dealing with mollusks, worms, and arthropods; seventeen parts are now completed.

General Treatises.—Among the series of books recounting the zoological or biological characteristics of special regions there are several worthy of mention. The sixth and last part of *Zoological Results* of the Willey expedition, based on material collected in New Britain, New Guinea, Loyalty Islands, and elsewhere, has appeared. The third part of the first volume of Mr. J. Stanley Gardiner's *Fauna and Geography of the Maldives and Laccadive Archipelagoes* has appeared, giving an account of the echinoderms, orthoptera, crabs, fishes, and turbellaria, each article prepared by a specialist in the group. The scientific results of the German *Valdivia* expedition and of the Dutch *Siboga* expedition are now appearing, and a number of volumes or parts of volumes have appeared. A most important work to zoologists is the first volume of Sherborn's *Index Nominum Animalium*, a book of 1300 pages, giving upwards of 60,000 names of animals proposed in the years 1758-1800, inclusive. The work is being prepared under the supervision of a committee from the British association, with the additional cooperation of the Royal and Zoological societies. The great work of compiling the *Scientific Memoirs of Thomas Henry Huxley*, to which Sir Michael Foster and Professor E. Ray Lankester have given themselves, has been completed in four volumes, the last of which appeared in the early summer. The subject of evolution, its means and its meaning, has been the source of an unusual number of valuable publications. Chief among these is Baldwin's *Development and Evolution*, a volume of nearly 400 pages, which, although not strictly zoological, deals very ably with the subject of animal origins, and sets forth with great clearness the new theory of *orthoplasy*. The presidential address of F. W. Hutton before the Australasian Association in 1902, somewhat enlarged; has been published under the title *The Lesson of Evolution*, and is intended to show that the whole end of evolution is designed to be the development of man's moral nature. The address of Professor H. E. Ziegler, *Ueber den derzeitigen Stand der Descendenz-lehre in der Zoologie*, before the German Naturalists at Hamburg in 1901, has also been enlarged and published. A rather remarkable book, entitled *The Primrose and Darwinism*, has been published in England anonymously, the aim of which is to show that Darwin's observations on the primrose were inaccurate and his conclusions erroneous, and therefore much of his argument in favor of natural selection is vitiated. An important pamphlet, entitled *Interpretación Dinámica de la División Celular*, by A. Gallardo, comes from Buenos Ayres and deals admirably with the mechanics of cell-division. As illustrating still further the cosmopolitan nature of science, mention should be made of the volume entitled *Response in the Living and Non-living*, by Jagadis Chunder Bose, of Calcutta. The author holds that the effects of poisons, depressants, stimulants, and fatigue are essentially the same in living and non-living matter. One of the most important publications of the year, and the one which has perhaps stirred up the most interest, is Bateson's *Mendel's Principles of Heredity: a Defence*, a volume of some 225 pages, in which Mr. Bateson very warmly supports the Mendelian as opposed to the Galtonian idea of "ancestral" heredity. A second volume, *Reports to the Evolution Committee of the Royal Society*, by Bateson and Miss Saunders, gives some of the experimental evidence which has led Bateson to his present position. Finally mention may be made of Professor C. F. Hodge's admirable little book, *Nature Study and Life*, a volume of over 500 pages, largely dealing with animals. It is without doubt the ablest and most sensible contribution to the nature study question that has yet appeared. For other zoological literature, see ENTOMOLOGY; ORNITHOLOGY.

ZOOLOGICAL SOCIETIES. The year 1902 was notable in the United States for the large number of meetings. Of foreign gatherings the following were the most important. The ninth meeting of the *Australasian Association for the Advancement of Science* was held at Hobart, Tasmania, January 8-16, under

the presidency of Capt. F. W. Hutton, whose address was on *Evolution and Its Teaching*. Professor W. B. Benham presided over the section of biology, and gave an interesting address on *Earthworms and Paleogeography*. The eleventh *Congress of Russian Naturalists and Physicians* was held at St. Petersburg early in January. The most important announcement was that the minister of public instruction had at last agreed not to oppose the formation of an association for the advancement of science, holding annual meetings. The meeting of the *German Association of Naturalists and Physicians* was held at Carlsbad, the fourth week in September, with the usual very large attendance. The *Royal Society* of London held its usual "conversazione" on May 14 and again in June, but the zoological exhibits were not specially noteworthy. The *Linnean Society* of London awarded its gold medal in May to Professor von Kolliker of Würzburg, the famous German zoologist. The seventy-third anniversary meeting of the *Zoological Society* of London was held April 29. The gold medal of the society has been awarded to Sir Harry Johnston for his zoological work in Central Africa, and the silver medal to Mr. E. W. Harper for his work in India. The meeting of the *British Association* was held at Belfast the third week in September, and though the attendance was not very large, the gathering was of unusual scientific interest. The zoological section (D) had for presiding officer Professor G. B. Howes, who took for the subject of his presidential address *The Morphological Method and Progress*, a most interesting review and summary of the revolution that has taken place in zoology in the past 28 years. There were reports received from eight committees, and 32 papers were presented. There were several papers on, and much discussion of, protective coloration and mimicry, and the influence of natural selection upon them. Several papers dealt with fishery questions and a number with embryological problems. One of the latter was by Mr. J. P. Hill of Sidney, describing the segmentation stages in the development of the egg of the Australian native cat (*Dasyurus*).

Turning now to American societies, we find a considerable number held very successful meetings during the year. The *New York Zoological Society* has issued its sixth annual report, which shows its affairs to be in a distinctly prosperous condition. It has acquired the aquarium in the Battery Park and has appointed C. H. Townsend, late of the United States Fish Commission, to be director. At the Zoological Park a new lion house has been erected and opened, and a veterinary staff has been established to secure scientific treatment of the animals and to study the causes and prevention of diseases. The *National Academy of Science* met in Baltimore in November, and among the papers presented were several dealing with zoological subjects, by Professors Agassiz, Brooks, and Osborn. The first general meeting ever held by the *American Philosophical Society* was held in Philadelphia early in April, with about 120 members in attendance. Of the papers presented, eight were zoological and several others were zoo-paleontological. One of the most important was Professor Ortmann's on the distribution of the fresh-water Decapods and its bearing on ancient geography. Another notable, though very brief, paper was that of Professor W. K. Brooks, *Is Scientific Naturalism Fatalism?*

American Association for the Advancement of Science.—The year 1902 will always be memorable in the annals of this organization because for the first time in its history it held two meetings, and though both were successful, the second or winter session was the most notable gathering of scientific men ever held in America. The summer meeting was held at Pittsburg, June 28 to July 3, and was attended by 431 members, the total membership at the close being about 3500. Of the 28 papers in zoology, a number were of very great interest, especially the presidential address of Professor C. S. Minot on *The Problem of Consciousness in Its Biological Aspects*. The conclusion of this notable paper was: The universe consists of force and consciousness. As consciousness by our hypothesis can initiate the change of the form of energy, it may be that without consciousness the universe would come to absolute rest. The address of President D. S. Jordan before section F was read (in his absence) by Professor C. H. Eigenmann, and was a full and interesting *History of Ichthyology*. Of the other papers, six dealt with insects and seven were zoo-paleontological. The association convened again in Washington, December 27 to January 3, and with it were affiliated no less than 23 other scientific societies of more limited scope. The attendance was all that could be desired, between eight hundred and a thousand scientists registering with some one or more of the various sections and organizations. But the sectional meetings were seriously interfered with in some cases through simultaneous meetings of some of the affiliated societies. Some 40 papers were presented before the section (or read by title). The vice-presidential address by Professor C. C. Nutting was on *Some Perplexities of the Systematist*.

American Society of Naturalists. American Morphological Society.—Both of

these organizations met at Washington during convocation week as affiliated societies with the American Association. The discussion before the naturalists was participated in by six of the leading scientists of America, and was on the question: "How can endowments be used most effectively for scientific research?" The address by President Cattell was an interesting résumé of the psychological characteristics of American men of science, the results of an original statistical plan. The programme contained more than 50 papers. W. J. Moenkhaus spoke on the *Individuality of the Maternal and Paternal Chromosomes in Hybrid Development*, a subject of great importance at a time when Mendel's law is causing so much discussion. W. Patten's paper on *The Structure of the Ostracoderms* dealt with a much debated question in vertebrate phylogeny. E. B. Wilson's papers are always listened to with eager interest, and the three given this year were favorably received; perhaps the most interesting was his *Notes on the Artificial Reversal of Asymmetry in Alpheus*. G. H. Parker's paper on *Reactions of Earthworms to Light of Different Intensities* was a valuable physiological report. Other interesting papers were those of Mayer, Kingsley, Grave, Dean, Conklin, Bristol, Reighard, and Holmes. The most important business transacted was the vote to change the name to the "Zoological Society of America." The *Naturalists of the Central States* and the *Zoologists of the Central States* also held business meetings in Washington during convocation week, but their programmes were merged in that of the Morphological Society.

INDEX OF TITLES

IN THE VOLUMES OF

The International Year Book

For 1898, 1899, 1900, 1901, and 1902.

[Page numbers are given in heavy-faced type.]
